A Few of the Leading Articles in Volume Two

WRITTEN AND SIGNED BY SPECIALISTS

AUGUSTINIANISM ..... JOHN GRIER HIBBEN
Professor of Philosophy, Princeton University

AUGUSTINIANS ..... THOMAS C. MIDDLETON, O.S.A.

AUTOMOBILE ..... MARIUS C. KRARUP
Formerly Editor of 'The Automobile'

BACTERIA AND BACTERIOLOGY ..... A. C. ABBOTT
Bacteriologist, University of Pennsylvania

BALTIMORE, MD. ..... WILLIAM H. LOVE
Secretary Board of Trade

BAND SAW BLADES ..... EDWARD C. MERSHON
Of W. B. Mershon & Co., Saginaw, Mich.

BANKS AND BANKING ..... O. P. AUSTIN
United States Treasury Department

BANKS AND BANKING, AMERICAN ..... LEVI PARSONS MORTON

BANKING INSTITUTIONS ..... WILLIS S. PAINE
President Consolidated National Bank, New York

BANKS, SAVINGS ..... WILLIAM HANHART
Secretary "Savings Bank Section," American Bankers' Association

BANQUETS ..... MILES BRADFORD
Author of 'Carlotta and I'

BAPTISTS IN AMERICA ..... HENRY CLAY VEDDER
Crozer Theological Seminary

BARBADOES ..... MARRION WILCOX
Authority on Latin-America

BATH, HISTORY OF THE ..... JOHN R. MEADER
Editor American Year Book

BEARINGS, ANTI-FRICTION ..... HENRY SOUTHERN
Engineer of the American Compound Bearing Co.

BEE KEEPING ..... E. R. ROOT
Author of 'A. B. C. of Bee Culture' and Editor of 'Gleanings in Bee Culture'

BEET ..... SAMUEL FRASER
Instructor in Agronomy, Cornell University

BEETHOVEN ..... HENRY T. FINCK
Musical Critic 'Evening Post,' New York

BERKELEY, GEORGE ..... H. W. WRIGHT
Of Cornell University

BERLIN ..... E. HIRSCHBERG
Director of Statistical Bureau of Berlin

BIBLE ..... CHARLES WOODRUFF SHIELDS
Prof. of Harmony of Science and Revealed Religion, Princeton University

BIRDS ..... ERNEST INGERSOLL
Editorial Staff, Encyclopedia Americana

BLIND, EDUCATION OF THE ..... EDWARD ELLIS ALLEN
Principal Pennsylvania Institution for the Instruction of the Blind

BOILER ..... A. D. RISTEEN
Hartford Steam Boiler Insp. and Ins. Co.

BOOK OF THE DEAD ..... SAMUEL A. BINION
Author of 'Ancient Egypt or Mizraim'

BOOKBINDING ..... EDWIN IVES
Of Edwin Ives & Sons, New York

BOOKKEEPING ..... EDGAR M. BARBER
Expert Accountant, U. S. Appraiser's Office

BOOTS AND SHOES ..... FREDERICK D. HULL
Vice-President 'The Shoe Retailer,' New York and Boston

BOSTON ..... M. A. DEWOLFE HOWE
Author of 'Boston: The Place and the People'

BOTANICAL GARDENS ..... D. T. MACDOUGAL
Director of Laboratories, New York Botanical Garden

BOTANY ..... FREDERICK V. COVILLE
Chief Botanist, U. S. Dept. of Agriculture

KEY TO PRONUNCIATION.

ã	far, father
ā	fate, hate
a or ă	at, fat
ã	air, care
ạ	ado, sofa
â	all, fall
ch	choose, church
ē	eel, we
e or ĕ	bed, end
ė	her, over: also Fr. *e*, as in *de; eu*, as in *neuf;* and *oeu*, as in *boeuf, coeur;* Ger. *ö* (or *oe*), as in *ökonomie.*
ẹ	befall, elope
ë	agent, trident
ff	off, trough
g	gas, get
gw	anguish, guava
h	hat, hot
h or H	Ger. *ch*, as in *nicht, wacht*
hw	what
ī	file, ice
i or ĭ	him, it
î	between e and i, mostly in Oriental final syllables, as, Ferid-ud-din
j	gem, genius
kw	quaint, quite
ṅ	Fr. nasal *m* or *n*, as in *embonpoint, Jean, temps*
ñ	Span. *ñ*, as in *cañon* (căn'yŏn), *piñon* (pēn'yŏn)
ng	mingle, singing
nk	bank, ink
ō	no, open
o or ŏ	not, on
ô	corn, nor
ȯ	atom, symbol
ọ	book, look
oi	oil, soil; also Ger. *eu*, as in *beutel*
ö or oo	fool, rule
ou or ow	allow, bowsprit
s	satisfy, sauce
sh	show, sure
th	thick, thin
ṫh	father, thither
ū	mute, use
u or ŭ	but, us
ů	pull, put
ü	between u and e, as in Fr. *sur*, Ger. *Müller*
v	of, very
y	(consonantal) yes, young
z	pleasant, rose
zh	azure, pleasure
' (prime), " (secondary)	accents, to indicate syllabic stress

THE ENCYCLOPEDIA AMERICANA

Atahualpa, ä'ṭa-wäl'pa (*atahu,* Latin *virtus* and *allpa,* sweet), a Peruvian inca, the son of Huayna Capac, eleventh inca. His brother Huascar succeeded Huayna Capac; but Atahualpa obtained the kingdom of Quito, and a civil war broke out between the brothers; though the details are not accurately known, it appears that when Pizarro was beginning to move inland Huascar had been defeated and thrown into prison, and Atahualpa had become inca. Pizarro set out in September 1532, and made for Cassamarca, where the inca was. On 15 Nov. Pizarro entered Cassamarca, and sent to request an interview with the inca. On the evening of the next day, Atahualpa entered the great square of Cassamarca, accompanied by some five or six thousand men, while Pizarro's artillery and soldiers were planted in readiness in the streets opening off the square. The interview was carried on by the priest Vicente de Valverde, through an interpreter. He stated briefly and dogmatically the principal points of the Christian faith and the Roman Catholic policy, and concluded by calling upon Atahualpa to become a Christian, obey the commands of the Pope, give up the administration of his kingdom, and pay tribute to Charles V., to whom had been granted the conquest of these lands. To this the inca at first returned a very temperate answer. The priest retired, and Pizarro at once gave the signal for attack. The Spaniards rushed out suddenly, and the Peruvians, astonished and defenseless, were cut down in hundreds. Atahualpa, thus treacherously captured, offered an enormous sum of money as a ransom, and fulfilled his engagement; but Pizarro still detained him, until the Spaniards should have arrived in sufficient numbers to secure the country. While in captivity, Atahualpa gave secret orders for the assassination of his brother Huascar, and also endeavored to raise an army to expel the invaders. His plans were betrayed, and Pizzaro at once brought him to trial. He was condemned to death, and, as being an idolater, to death by fire. Atahualpa, however, professed himself a Christian, received baptism, and his sentence was then altered into death by strangulation. His body was afterward burned, and the ashes conveyed to Quito. Consult Prescott, 'Conquest of Peru.'

Atakapa, ä'ṭa-kä'pa, the designation of an extinct cannibal tribe who occupied the west gulf coast of Louisiana.

Atala, a'ṭa'la, a romance of the American wilderness, by Châteaubriand, published in 1801. It is the extravagant and artificial but beautiful story of two lovers — a young Indian brave, Chactas (that is, Choctaw), and an Indian maiden, Atala.

At'alan'ta, the name of two heroines in Greek mythology. One was a native of Arcadia, celebrated for her skill in archery. She slew with her arrows the Centaurs Rhœcus and Hylæus, sailed to Colchis with the Argonauts, and was present at the chase of the Caledonian boar, which she first wounded; hence Meleager awarded to her the prize. She was renowned for her beauty and swiftness in running. She stipulated that every candidate for her hand should run a race with her, and if he conquered her she was his own, but if he was conquered he was doomed to death at her hand. Many had fallen victims in the attempt, when Meilanion, by the aid of Aphrodite, overcame her. The goddess gave him three golden apples, which he threw behind him, one after another, as he ran. Atalanta stopped to pick them up, and Meilanion reached the goal before her. She accordingly became his wife. The other Atalanta, who cannot very well be distinguished from the preceding, the same stories being told about both, is connected with Bœotia and Bœotian localities. She is said to have been married to Hippomenes. See Morris, 'Atalanta's Race.'

At'alan'ta in Cal'ydon, a tragedy by Algernon Charles Swinburne, published in 1864. It deals with a Greek theme, and employs the Greek chorus and semichorus in its amplification. To this chorus are given several songs,

which exemplify the highest charms of Swinburne's verse — his inexhaustible wealth of imagery, and his flawless musical sense. The story is founded upon the hunting of the Caledonian boar.

At'aman, the title of the chief of the Cossack tribes. See HETMAN.

Ataulfus, Ataulf or **Adolf,** king of the Visigoths. The date of his birth is unknown. He was the brother-in-law of Alaric, whom he assisted in the sieges of Rome. After Alaric's death he went to Gaul and married Galla Placidia, sister of the emperor, June 414. In the same year he went to Spain and was assassinated at Barcelona in 415.

At'avism (Latin *atavus,* originally "ancestor," later specialized as "great-great-great-grandfather"): in biology, the reappearance in an organic being of specific ancestral peculiarities which have not appeared in intermediate generations, or of peculiarities of ancestral side branches not represented in the direct line. It is often loosely used as synonymous with reversion, but in scientific usage the latter is not the reappearance of single characteristics, and certainly not of abnormal ones, but the return in general type to the primitive type from which the special race was evolved. In this sense, it may be said that reversion is the extreme backward limit of atavism. For example, the birth of a six-fingered child with a six-fingered grandfather or uncle but normal parents would be atavism; but the approach of human beings left on a desert island to the prognathous and hairy type of the simians, were it conceivable, would be reversion. Sometimes the two are hardly to be discriminated; thus, the appearance of a tail-bone or pointed ears would be an atavism recalling the primitive type, as are horses with toes, yet not quite a reversion. A true reversion is the banded pigeon which is a frequent "sport" among fancy breeds; and the still commoner mongrel "yellow dog," a reversion to the jackal type. Atavisms are part of the perpetual family wonders, the reproduction of minute special features, habits, tricks of behavior, even tastes and fashions of speech, characteristic of distant relatives or far-back ancestors, but perhaps obliterated for long periods. In sociology, especially criminology, the word is used precisely in the sense of reversion to primitive instincts and passions, supposed to be overlaid or suppressed by civilization. The criminal on this theory is a being who has lost his evolved characteristics, and gone backward to the primitive savage. This, however, has too many flaws to be scientifically acceptable.

Atax'ia, an irregularity of function, but the term is usually applied to inco-ordination of muscular movements. It is a phenomenon seen in many disordered states of the body and not confined to the one disease, locomotor ataxia. Thus, ataxia is a common symptom of alcoholic intoxication. Two forms of ataxia may be distinguished, static and motor. In static ataxia there is an irregularity in the maintenance of attitudes and positions. This form of ataxia is common in chronic cocaine poisoning and is present in some severe cases of chorea, or St. Vitus' dance. The patients' limbs seem to give way beneath them and there is a restless irregularity in attitude and pose. Static ataxia is also a symptom in certain types of insanity, notably the disease termed catatonia. Motor ataxia is a much commoner form of this condition. In alcoholic intoxication it is well developed and the loss of control, largely due to diminution of the function of the sensory nerves, is too well known to need description. In a number of diseases of the nervous system ataxia of the muscles of the arms, lips, tongue, trunk, and lower limbs is a prominent symptom. Ataxia is to be distinguished from loss of the sense of equilibrium. See CEREBELLUM; CO-ORDINATION; EQUILIBRIUM; HEMIPLEGIA; LOCOMOTOR ATAXIA; SCLEROSIS.

Atbara, at-bä'ra (*Bahr-el-Agwad,* or Black River), an important tributary of the Nile. It rises in Abyssinia to the northwest of Lake Tzana, flows to the north, receiving several large tributaries, especially the Mareb and Tacazzé, and enters the Nile lat. 17° N.

Atchafalaya, ăch'ă-fa-lī'ya, a river in Louisiana, an outlet of the Red River. It flows southward through Grand Lake, and enters the Gulf of Mexico by Atchafalaya Bay. Its length is estimated at 250 miles and it is supposed to have been formerly the principal channel of the Red River.

Atcheen, a province of the Dutch Indies, until 1873 an independent state in the northwest part of Sumatra. Area 20,471 square miles, and containing a population of about 500,000. See ACHIN.

Atch'ison, David Rice, American legislator: b. Frogtown, Ky., 11 Aug. 1807; d. 26 June 1886. He was educated for the bar, and began practising in Missouri, in 1830. He was elected to the legislature in 1834 and 1838; was appointed judge of the Platte county circuit court; and, in 1843, while holding this office, was appointed United States senator to fill a vacancy. He was twice elected to the last office, and during several sessions was president *pro tem.* of the Senate. During Sunday 4 March 1849, he was the legal President of the United States, as Gen. Taylor, the President-elect, was not sworn into office until the following day. Senator Atchison became conspicuous in the slavery debates and in the Kansas-Nebraska struggle, because of his strong pro-slavery views. The city of Atchison, Kan., was named after him.

Atch'ison, Kan., a city and county-seat of Atchison County; on the Missouri River, 20 miles above Fort Leavenworth and on the Atchison, T. & S. F., the Chicago, R. I. & Pacific, the Burlington & Q. and other railroads. The city is beautifully situated on the "Great Bend" of the Missouri River, and because of its excellent river and extensive railroad facilities it is an important commercial centre, and one of the principal cities of the State. It exports large quantities of grain, flour, live-stock, coal, lumber, fruit, and general agricultural produce. The wholesale trade of the city in groceries, drugs, hardware, etc., is also very extensive, representing annually more than $50,000,000. The manufacturing interests of Atchison are important, there being over 50 large industrial establishments, including grain ele-

vators, flouring-mills, foundries, railroad shops, carriage works, brick yards, furniture, broom and harness factories, etc. The city contains many attractive buildings, notably the county court-house and government building, and the union depot erected at a cost of $140,000. The Missouri River is bridged by a noteworthy structure some 1,200 feet long. There are three parks in the city — Forest, City and Central; three banks with a combined capital of $300,000 and an annual business of $7,000,000; daily, weekly and monthly periodicals, and gas, electric-light, sewer, water and electric railway plants. Atchison is the seat of the State Soldiers' Orphans' Home; Wells' Insane Asylum; Allaman's Hospital; Midland College (Lutheran); Saint Benedict's College (Roman Catholic); Mount Saint Scholastica's Academy (Roman Catholic); has a fine public library and an excellent system of public education (8 public and 3 parish schools). The school board is chosen by popular vote. The city is governed by a mayor, elected every two years, and a municipal council of 10 members. The mayor appoints the administrative officials who are subject to confirmation by the city council. The city was first settled in 1854 and was named in honor of Senator D. R. Atchison. It was incorporated as a city in 1859. Pop. (1904) 16,925.

H. B. Horn,
Editor Atchison Champion.

Atchison, Topeka & Santa Fé Railway, The, one of the most important railways in the United States, and including a long list of auxiliary companies. The charter was granted 3 March 1863, the route prescribed being from Atchison on the Missouri River to the western boundary of the State of Kansas, in the direction of Santa Fé, New Mexico, a distance estimated at 500 miles. The time for completion was limited to 10 years, which expired 3 March 1873. Five years and six months were allowed to pass without commencing operations. In September 1868 the charter was transferred to new parties. In 1869 28 miles were built; in 1870 34 miles; in 1871 75 miles. The western boundary of Kansas not having been established, it was estimated that the remainder to be built, with only one year for the completion of the road and telegraph line which was to accompany it, was 345 miles. By great effort the means were provided, and the work completed with rapidity then unprecedented, and the cars were run over the entire line from the Missouri River to Colorado, about 470 miles, on the 28th day of December 1872, thereby saving the land grant, which would have been forfeited had the road not been completed before 3 March 1873. The road was remarkably well built, much better than the majority of western railways at that time, and in general construction bore comparison with the best roads either east or west. It ran for the greater part in the valley of the Arkansas River, with easy grades and curves, and almost immediately developed an amount of business that surprised the ownership and the public. The part which this railway has had in the building up of Kansas, Colorado and other sections through which it runs cannot be overestimated. It opened vast tracts of productive land to settlement, and drew a large emigration from the East to that region, where thriving towns and fertile farms took the place of what had been a desert. The road acquired a large share of through business in 1876 by leasing the Pueblo & Arkansas Valley and the Kansas City, Topeka & Western. Steel rails were adopted in place of iron, and neither effort nor expense were spared to bring the road up to the highest standard.

The growth of the Atchison, Topeka & Santa Fé in 30 years is shown by recent statistics. In 1875 the gross earnings of the system were $1,500,000, operating expenses $700,000; and net earnings $800,000; in 1902 the gross earnings were $59,100,000; operating expenses $33,000,000; and net earnings $25,200,000. The growth of mileage has been equally rapid. In 1875 the road only extended from Kansas City and Atchison to Wichita and Pueblo, 711 miles. On 30 June 1902 the main track mileage operated was about 7,900, which has since been added to considerably by the acquisition of new lines. The rolling stock, about 28 years ago, consisted of 38 locomotives and 1,028 cars, including two Pullmans. By recent figures it was 1,312 locomotives and 36,370 cars. Locomotive repairs were $60,000 in the early period, and $3,700,000 in the present. Grain shipments in 1875 were 28,400 tons, and were by late figures 1,550,000 tons. Live stock jumped from 87,500 head to 870,000 head. Passenger and freight traffic showed proportionate increase. These figures give an idea not only of the growth of the Atchison, Topeka & Santa Fé system, but also of the strides made by the Western United States in the past 30 years.

In the annual report of the Atchison, Topeka & Santa Fé for 1904 President Edward P. Ripley says:

"The large increase in the system earnings reflects the rapid growth of the territory served by your lines in population and wealth, and this growth is likely to continue. Many miles of your main lines are fed by but few branches, and extensive territory that should furnish profitable traffic to the system still remains, in a great measure, undeveloped for want of adequate railroad facilities. The construction of additional branches and feeders will be desirable in the near future, in order to increase the earnings of the system and strengthen its position, and in order to furnish additional transportation facilities to the growing territory through which the system extends. Furthermore, the traffic on your main lines has become so dense that the construction of second tracks and provision for additional equipment will soon be imperative. Since the year 1896 more than $30,000,000 of surplus net income has been applied to the development and enlargement of your properties, and it is expected that a considerable amount of surplus net income will be applied in like manner hereafter; but it is the opinion of your directors that additional capital should be obtained during the next few years for the purposes above referred to, and it is believed that the expenditure of this capital will result in a substantial increase of the surplus net income of the company."

The gross earnings for the year amounted to $68,171,200, an increase of $5,820,802 as compared with 1903. The operating expenses show an increase of $3,784,922. The mileage of the railroad increased 214.46. Of this increase, 134

miles was due to the completion of the Eastern Oklahoma Railway. It also includes the Gulf, Beaumont & Kansas City Railroad, which was leased during the year.

Ate, ā'te, among the Greeks the goddess of hate, injustice, crime, and retribution. According to Homer she was the daughter of Zeus, but according to Hesiod, the daughter of Eris (Strife). She was a vengeful goddess and was banished from Olympus by Zeus, whom she had induced to take an oath of which he subsequently repented. Her influence was always pernicious, and in her journeyings over the earth she afflicted mankind, but she was followed by other goddesses, the benevolent daughters of Zeus, who restored those who had come under Ate's evil influence.

At'eles, a genus of South American monkeys of the division with long prehensile tails, to which the name Sapajou is sometimes collectively applied. The head is round, and the facial angle about 60 degrees; the limbs are remarkably long and slender, upon which account the English name of spider monkey is sometimes used as a generic designation; the forelimbs are either destitute of a thumb or have a rudimentary one.

Ateles'tite, a native basic arsenate of bismuth, having the formula $3Bi_2O_3.As_2O_5.2H_2O$. It is yellow in color, and translucent with an adamantine lustre. It occurs in small monoclinic crystals, at Schneeberg, Saxony.

Ateliers Nationaux, ạ-tĕ-lĭā' na'syō'nō', national workshops established by the provisional government of France in 1848. Previous to the outbreak of the revolution of Feb. 1848, there had been two years of scarcity, inundation, and commercial crisis. *Ateliers nationaux,* or national workshops, were opened at once. The workmen were organized under lieutenants and brigadiers of their election. The number of applicants, including arrivals from the provinces, at length exceeded 100,000, and the total expense reached nearly 16,000,000 francs. The men were employed on roads, railways, earthworks, etc., but it was impossible to find work for the whole, and a great part of the labor was unprofitable. There were besides 30,000 to 40,000 women employed in preparing articles of outfit for the army, whose work left only a trifling loss. In June the Constituent Assembly resolved upon the immediate closing of the ateliers. This rash step provoked the insurrection of the Red Republicans (23d–26th June), suppressed by Gen. Cavaignac with fearful slaughter. In Lyons the ateliers were closed without disturbance, but in some other towns trouble was occasioned.

At'ella'næ Fab'ulæ (called also *Oscan plays*), a kind of light interlude between tragedy and comedy, performed by freeborn young Romans. This kind of a play is said to have originated in *Atella,* a city of the Oscans, between Capua and Naples, and a few disconnected fragments are all that remain of a national Italian comedy, consisting of farce seasoned by satire.

Atesh'ga (the place of fire), a place much revered by Persian fire-worshippers. It is on the peninsula of Apsheron, on the west coast of the Caspian, and is visited by large numbers of pilgrims, who bow before the sacred flames issuing from the bituminous soil.

Ath, ät, a town of Belgium, 14 miles from Mons. It has a hospital and college and important manufactures of linen, lace, cutlery, soap, and large hammers. It was formerly a fortress. Pop. (1900) 11,100.

Ath'a, a false prophet in the reign of the Caliph Mehedy, or his predecessor, Al-mansur. He taught the doctrine of metempsychosis, and claimed to be an incarnation of divinity. He had lost one of his eyes, on account of which he always wore a veil, whence he received the epithet of Mokanna. He is the hero of Moore's «Veiled Prophet of Khorassan» in 'Lalla Rookh.'

Athabasca, ăth'a-băs'ka, a district in northwestern Canada formed in 1882 and enlarged in 1895. It contains 251,965 square miles, including 8,805 square miles of water area, and is bounded on the north by the district of Mackenzie, on the east by the district of Keewatin, on the south by the districts of Saskatchewan and Alberta, and on the west by British Columbia. The district is watered by the Athabasca and Peace rivers. There are numerous lakes in the district, chief of which are Athabasca in the north and Reindeer in the east. The climate varies greatly but is not so severe as the high latitudes would seem to imply, and the air is very clear and bracing. The snow and rainfall is not great, but during the growing months of summer the rains are abundant, which add much to the productiveness of the district. The soil in the western part of the district is very fertile, and wheat, potatoes, and other cereals are readily grown. In the eastern section the soil is less fertile, being rocky and sandy. The fur trade is still a considerable industry. The country is well wooded with spruce, pine, and poplar. In the west the aspen trees predominate, growing to considerable size. The population of the district is small, consisting mostly of Indians (1,239) and half-breeds, who support themselves by hunting, but the immigration to the Northwest will soon seek this productive territory. The principal settlement is Dunvegan, in the southwest. On 1 Sept. 1905 the province was divided, the westerly portion being united to Alberta, and the easterly portion combined with Saskatchewan and Assiniboia to form the province of Saskatchewan.

Athabasca, (1) the name of a river in northwestern Canada which has its source in the eastern slopes of the Rocky Mountains, near Mount Brown, pursues a tortuous course to the north till it falls into Lake Athabasca. (2) The name of a Canadian lake, in the northwest territories, also called Lake of the Hills, 230 miles in length and averaging 14 miles in width. Near its southwestern extremity it receives the Athabasca River and discharges its waters northward by the Great Slave River. The north shore is high and rocky and thickly wooded with firs and poplars, etc., the south shore is level.

Athabasca Pass, a narrow passage in the Canadian Rocky Mountains, between Mount Brown and Mount Hooker. It crosses the boundary between the district of Alberta and British Columbia.

Ath'ali'ah, the daughter of Ahab, king of Israel, and wife of Joram, king of Judah. She was a woman of abandoned character, and fond of power, who, after the death of her son Ahaziah, opened her way to the throne by the murder of 42 princes of the royal blood. She reigned six years; in the seventh the high priest Jehoiada placed Joash, the young son of Ahaziah, on the throne of his father. Athaliah, attracted by the noise of the people who were crowding to the coronation of Joash, entered with them into the temple, where the ceremony was going on. At the sight of the new king, surrounded by priests, Levites, great officers of the kingdom, and the joyful people, she was beside herself; she tore her hair, and cried out, "Treason!" Jehoiada ordered her to be immediately led from the temple by the officers, and commanded that all who should offer to defend her should be slain; but she was put to death at the gate of the palace without opposition. The altars of Baal, which she had erected, were thrown down, and the worship of God restored (about 877 B.C.) (2 Kings viii. ix.). This story is the theme of Racine's 'Athalie,' written at the request of Madame de Maintenon.

Athalie, a'ta-lę, a famous tragedy by Racine, based on the Bible story of Athaliah. It was first performed in 1600. Rachel won her greatest triumphs in this play.

Ath'amas, the son of Æolus, and husband of Nephelē, the cloud goddess. Their children were Hellē and Phryxus. Being afterward separated from Nephelē, he had by Ino, his second wife, Learchus, Melicertes, and Eurycleia. Athamas, having lost his reason through the anger of Hera, and taking Ino and her children for a lioness and her whelps, seized Learchus and dashed him against a stone; while Ino, with Melicertes in her arms, plunged into the sea, and became the sea goddess Leucothea, Melicertes being transformed into Palænon, a divinity worshipped by sailors. Athamas now abandoned Bœotia and fled to Phthiotis, where he built Alos, and united himself with Themisto.

Athan'agild, the 14th king of the Spanish Visigoths, who succeeded Agila in 554, and died in 566. Being threatened by Agila, he applied for aid to Justinian, emperor of the East, who sent troops, and Athanagild defeated his adversary, who was obliged to retire to Merida. Athanagild was re-established at Toledo, which he made his capital.

Athan'aric, a king of the Visigoths in Thrace about the middle of the 4th century: d. Constantinople, 25 Jan. 381. The emperor Valens made war upon him and compelled him to sue for peace, but Athanaric would not come upon the Roman territory to sign the treaty, while Valens thought it beneath his dignity to visit the barbarian at home. Accordingly a bridge of boats was constructed across the Danube, and the two potentates met in the middle. In 380 he was compelled to flee to Constantinople, where Theodosius received him hospitably, and gave him a small pension until his death. See Hodgkin, 'Italy and Her Invaders,' Vol. I. (1880).

Athanasian (ăth'a-nā'zhăn) **Creed.** See CREED.

Athanasius (ăth'a-nā'zhĭ-ŭs) **Saint,** Bishop of Alexandria, a celebrated Greek theologian: b. Alexandria about 296; d. 373. He had a Christian education, and came into the family of Alexander, afterward archbishop of Alexandria. Alexander took him to the council at Nice, where he gained the highest esteem of the fathers by the talents he displayed in the Arian controversy. About 326 he became bishop of Alexandria. The complaints and accusations of his enemies at length induced the emperor Constantine to summon him in 334 before the councils of Tyre and Jerusalem, but his judges could do nothing, however, further than suspend him from his office. He still continued in the discharge of his duties until the emperor, deceived by new falsehoods, banished him to Treves. The death of Constantine put an end to this banishment at the end of a year and some months. Constantius, emperor of the East, recalled the holy patriarch. His return to Alexandria resembled a triŭmph. The Arians made new complaints against him, and he was condemned by 90 Arian bishops assembled at Antioch, while 100 orthodox bishops, assembled at Alexandria, declared him innocent. Pope Julius confirmed this sentence, in conjunction with more than 300 bishops assembled at Sardis from the east and west, and in consequence of this he returned a second time to his diocese. But when Constans, emperor of the West, died, and Constantius became master of the whole empire, the Arians ventured to rise up against Athanasius. Athanasius, displaced for a third time, fled into the deserts of Egypt. His enemies pursued him even here, and set a price on his head. To relieve the hermits who dwelt in these solitary places, and who would not betray his retreat, from suffering on his account, he went into those parts of the desert which were entirely uninhabited. He was followed by a faithful servant, who, at the risk of his life, supplied him with the means of subsistence. In this undisturbed spot Athanasius composed many writings, full of eloquence, to strengthen the faith of the believers, or expose the falsehood of his enemies. When Julian the Apostate ascended the throne he allowed the orthodox bishops to return to their churches. Athanasius therefore returned after an absence of six years. The mildness which he exercised toward his enemies was imitated in Gaul, Spain, Italy, and Greece, and restored peace to the Church. But this peace was interrupted by the complaints of the heathen, whose temples the zeal of Athanasius kept always empty. They excited the emperor against him, and he was obliged to flee to Thebais to save his life. The death of the emperor and the accession of Jovian again brought him back; but Valens becoming emperor eight months after, and the Arians recovering the superiority, he was once more compelled to flee. He concealed himself four months, until Valens, moved by the pressing entreaties and threats of the Alexandrians, allowed him to return. From this period he remained undisturbed in his office until he died, 373. Of the 46 years of his official life he spent 20 in banishment, and the greater part of the remainder in defending the Nicene Creed. Athanasius is one of the greatest men of whom the Church can boast. His deep mind, his noble heart, his invincible courage, his living faith,

his unbounded benevolence, sincere humility, lofty eloquence, and strictly virtuous life, gained the honor and love of all. His voluminous writings, which are chiefly controversial and dogmatical, treat of the mysterious doctrines of the Trinity, the incarnation of Christ, and the divinity of the Holy Spirit. His 'Apology Against the Arians,' addressed to the emperor Constantine, is a masterpiece. The creed which goes under his name was not written by him, but belongs to a later time. (See CREED.) The most complete edition of of his works is that published at Padua in 1777 (4 vols. folio).

Athapascan Stock (also *Tinneh*), of American Indians, and one of their most numerous and widely distributed linguistic and ethnological groups. The type-name is taken from a northwest Canadian group, the western Montagnais; but the tribes are scattered from Alaska to Mexico. The original stock were semi-arctic, along the Yukon and Mackenzie, fierce and energetic, but of a low type of culture; and spread southward by conquest on both sides of the Rocky Mountains. They are divided into three chief groups, the northern, the Pacific, and the southern. The first are those in the original home,— northwest Canada and interior Alaska,— Montagnais, Montagnards, Chippewayan, Kutchin, etc. These number about 8,500. The second are those of Washington, Oregon, and California, except the Thlinkeet coast tribes, which extend along the Alaskan coast also. These are few and scattered tribes, about 900 souls in all. The southern, and far the most important, comprises some 23,500 mostly of the great Apache and Navajo confederacies, also the Jicarillas and Mescaleros, and the Lipan, of Mexico.

Atharvana, at'här'vănạ, the fourth of the Indian Vedas. Its language is more modern than that of the other three. The theological treatises, regarded as 52 in number, called Upanishads, are appended to the Atharvan Veda.

A'theism, the denial of the existence of a God. Among the Greeks atheism consisted in a denial or non-recognition of the gods of the State. Socrates was put to death for asserting the superiority of the divine wisdom to the other gods, as the ruler and disposer of the universe, thus contradicting Greek mythology, which assigned that office to Zeus. In Latin times atheism still continued to be a negation, with no pretension to rank as a system. It was closely akin to that cultured unbelief which extensively prevailed among the Humanists during the early part of the Renaissance. The atheism of the 18th century was a protest against current religious hypocrisy; and, like its predecessors, put forward little or nothing to replace the system it attempted to destroy. The atheism of the 19th century may be taken to include every philosophic system which rejects the notion of a personal Creator; in this sense it ranks as a genus, of which Atomism, Pantheism, Positivism, etc., are species. Strictly, it is the doctrine that sees in matter the sole principle of the universe. Popularly, atheism consists in the denial of a God; this view is probably founded on the mistranslation of Psalms xiv. 1, and liii. 1, which should be, "The fool hath said in his heart, No God for me," that is, he wilfully rejects God, at the same time knowing that he is.

Ath'el, or **Æthel,** an Old English word signifying noble, eminent, not only in blood or by descent, but in mind. It is frequently a part of Anglo-Saxon proper names.

Ath'eling, a title of honor among the Anglo-Saxons, meaning one who is of noble blood. The title was gradually confined to princes of the blood royal, and in the 9th and 10th centuries applied exclusively to the sons or brothers of the reigning king. It was first conferred on Edgar by Edward the Confessor, his grand-uncle, who bestowed it when he designed to make him successor to himself.

Athelney, ăth'ĕl-nĭ, a marshy island in Somersetshire, England, about seven miles southeast of Bridgewater. It is formed by the junction of the rivers Parret and Tone. Alfred the Great established a fortified post here during a Danish invasion, and afterward founded an abbey which has entirely vanished.

Ath'elstan, a Saxon monarch, the first to assume the title of king of England. He succeeded his father, Edward the Elder, in 925, and died in Gloucester, 27 Oct. 940. He was victorious in his wars with the Danes of Northumberland, and the Scots, by whom they were assisted. After the overthrow of his enemies at Brunanburh (937), which became famous in Saxon song, he governed in peace and with great ability.

Ath'enæ'um, the general name of temples to Athena, but more especially applied to the temple at Athens, frequented by poets, learned men, and orators. Instruction was also given there to the youth, and in later times the name was applied to all places of education for the young. The same name was given at Rome to the celebrated school which Hadrian established on the Capitoline Mount about 135 A.D. Many learned men received ample salaries for giving instruction in this institution, and that they might be enabled to study at leisure. Here also learned men assembled to exchange ideas.

Ath'enæus, a Greek rhetorician and grammarian, who lived at Naucratis, in Egypt, then at Alexandria, and afterward at Rome, at the end of the 2d and beginning of the 3d century after Christ. He has left an encyclopedic work in the form of conversation, called the 'Feast of the Learned' (Deipnosophistæ), a rich but ill-arranged treasury of historical, antiquarian, philosophical, grammatical, and other knowledge. The principal editions are those of Schweighäuser (1801–7); Dindorf (1827); Meineke (1859–67).

Ath'enag'oras, a Christian philosopher of Athens, who wrote in Greek an 'Apology for the Christians,' addressed to the emperor Marcus Aurelius, in 177. This work defends the Christians from the accusations brought against them by the heathens (of atheism, of incest, of

eating murdered children, and the like), with a philosophical spirit and in a lively and forcible style.

Ath'ena'is, or **Eudocia,** empress of the East, daughter of the Athenian philosopher Leontius: b. Athens about 393–4 A.D.; d. Jerusalem about 465. Athenais gaining the favor of Pulcheria, sister of the emperor Theodosius, a youth of 20 years of age, presently became the wife of Theodosius and was persuaded to receive baptism by the name of Eudocia. By Theodosius she had a daughter, Eudoxia, who was married to Valentian III., emperor of the West. She was indisposed to submit to the authority of Pulcheria, who virtually ruled the empire of the East, and a quarrel ensued, in which Eudocia had for a time the ascendency; but the jealousy of her husband being aroused, the authority of Pulcheria was restored, and Eudocia was permitted to retire to Jerusalem. When her daughter and granddaughters were taken prisoners by Genseric she became reconciled to the orthodox Church.

Athene, ạ-thē'nẹ. See MINERVA.

Athe'ne, Temple of. See ÆGINA.

Athen'odo'rus, a Greek sculptor of the Rhodian school, who, with his father, Agesander, and Polydorus, executed the celebrated group of the «Laocoon.»

Ath'ens, Ala., county-seat of Limestone County, situated on the Louisville & N. railroad, 107 miles south of Nashville, Tenn., 85 miles north of Birmingham. Athens has a cotton factory, knitting mill, sash, door and blind factory, two large lumber mills, State Agricultural School; Athens Female College, under ownership and direction of North Alabama Conference, Methodist Episcopal Church south. Has five churches for whites and several churches for colored population, and two newspapers. Surrounded by a splendid agricultural country and has many advantages. City owns and operates water and light plant and the town has an excellent sewer system. City also owns and operates a dispensary.

ROBERT M. RAWLS,
Editor 'Alabama Courier.'

Ath'ens, Ga., a city and county-seat of Clarke County, on the Oconee River, and the Central of G., the Georgia, the Northeastern of G., and the Seaboard A. L. R.R.'s, 67 miles east of Atlanta, the State capital. It is in a cotton-growing region; has a large trade in that staple; and contains cotton and woolen, cotton-seed oil, bobbin, and hosiery mills, iron works, furniture factories, and other industrial plants. It is the seat of the University of Georgia, the State College of Agriculture and Mechanic Arts, Lucy Cobb Institute, Knox Institute, Jeruel Academy, and a State Normal School. There are electric light and street railway plants, two national banks, several hotels, and daily, weekly, and monthly periodicals. The assessed property valuation exceeds $6,000,000. Athens was first settled in 1801. Pop. (1904) 14,000.

Ath'ens (ancient Greek, *Athēnai*), the capital of the kingdom of Greece, anciently the capital of the State of Attica and the centre of Greek culture. Its origin and early history are shrouded in darkness. It is situated in the central plain of Attica, about four miles from the Saronic Gulf or Gulf of Athens, an arm of the Ægean Sea, running in between the mainland of Greece and the Peloponnesus. The site is irregular, the city having been built on and around several hills rising from the plain, Mount Lycabettus, on the northeast, overlooking the whole. The principal eminence within the city boundary was the Acropolis, the site first built on; west from the Acropolis was a lower hill, called the Areopagus; southwest from the Areopagus was the Pnyx and south from the Pnyx the Museum; toward the sea on the south the view was unimpeded. On the east of the city was the stream known as the Ilissus, and on the west the Cephissus. The Acropolis was often called Polis or the city, from its having formed the original nucleus of the town, while the whole city, or sometimes only the lower city, as distinct from the Acropolis, was called Asty. In the Areopagus and the line of hills that run north and south to the west of it traces of numerous dwellings cut in the rocks have recently been found. At its most flourishing period, in the 5th century B.C., Athens was connected with its port-town Piræeus and the harbors of Piræeus and Munychia by two massive walls 550 feet apart, while a third wall ran to the less important harbor of Phalerum. The first was considered the most convenient, and was one of the emporiums of Grecian commerce. The surrounding coast was covered with magnificent buildings, whose splendor vied with those of the city. The walls of rough stone which connected the harbors with the city were so broad that carriages could go on their top. The Acropolis contained the most splendid works of art of which Athens could boast. Its chief ornament was the Parthenon or Temple of Athena Parthenos (the Virgin). This magnificent building was 228 feet long, 101 broad, and 66 high. It was built under the administration of Pericles, and finished in 438 B.C. It was of the Doric order of architecture, and was built of marble, resting upon a basement of limestone. It had columns on all sides, 8 at either front and 17 at the sides, counting the corner columns twice. These columns were fully six feet in diameter at the base, and 34 feet high. The structure was adorned both within and without with statues, reliefs, and other sculptures. Inside the temple stood the statue of Athena by Phidias, a masterpiece of art, nearly 40 feet high, the unclothed portions formed of ivory, the drapery of plates of gold, the weight of which was estimated at 44 talents. The Propylæa, a magnificent building, built of white marble, formed the entrance to the Acropolis, of which it covered the whole western end. A splendid marble stair, 70 feet broad, led up to the Propylæa. The chief building on the Acropolis, in addition to the Parthenon and the Propylæa, was the Erechtheum, a kind of double temple, especially sacred to Athena Polias (or Athena, guardian of the city), and Erechtheus, or Poseidon. On the Acropolis also were other temples, altars, statues, etc., including a colossal bronze statue of Athena Promachos, 50 or 60 feet high. On the south slope of the Acropolis were the theatre of Dionysus, the Odeum of Pericles, and the later Odeum of Herodes, the latter two buildings being intended for musical competitions. In

the lower city the greatest pieces of architecture were the temples of Theseus and Olympian Zeus, one of which stood on the northwest, the other on the southeast side of the Acropolis. The first was of Doric architecture, and resembled the Parthenon. On the metopes of this temple the famous deeds of Hercules and Theseus were excellently represented. The temple of Zeus Olympius was of Corinthian architecture, and was the largest temple in Athens, and the greatest ever erected to the supreme deity of the Greeks. It was begun by Pisistratus, and continued from time to time until at length, after 700 years, it was finished by Hadrian. The outside of this temple was adorned by 120 fluted columns, 60 feet high, and 6 feet in diameter. It was 354 feet long and 171 broad. Other structures deserving of notice were the Horologium of Andronicus Cyrrhestes or the "Temple of the Winds," the choragic monument of Lysicrates, and the Stoa Poikilē or gallery of paintings. Besides these wonderful works of art Athens contained many other places which must always be interesting from the recollections connected with them. Such a spot was the renowned Academy where Plato taught, lying about six stadia north of the city, and consisting of a gymnasium surrounded by walks, groves, and fountains. Such a place was the Lyceum, where Aristotle taught, and which, through him, became the seat of the Peripatetic School. It lay on the bank of the Ilissus, opposite the city, and was also used for gymnastic exercises. Not far from thence was the less renowned Cynosarges, where Antisthenes, the founder of the Cynic School, taught. The sects of Zeno and Epicurus held their meetings in the city. Zeno chose the well-known Poikilē, and Epicurus established himself in a garden within the walls, for he loved both society and rural quiet. Not only literary, but political assemblies gave a particular interest to different places in Athens. Here was the court of Areopagus, where that illustrious body gave their decisions; the Prytaneum or senate-house; the Pnyx, where the free people of Athens deliberated. After 23 centuries of war and devastation, of changes from civilized to savage masters, have passed over this great city, its ruins still excite astonishment. The northern wing of the Propylæa is still tolerably perfect, and the inner wall, with its five gateways leading into the Acropolis, still stands. The Parthenon remained almost entire till 1687, when it was much injured by an explosion of gunpowder during the siege of Athens by the Venetians. It is now a magnificent ruin. Its two pediments represented, respectively, the contest of Poseidon and Athena for Athens and the birth of the goddess, while the metopes represented a number of events in which the goddess or heroes connected with Athens took part. A great number of these sculptures are now in the British Museum. In the whole of this mutilated building we find an indescribable expression of grandeur and sublimity. Near the Propylæa is the small but elegant temple of Nikē Apteros (Wingless Victory), which having been destroyed in 1687, was re-erected in 1835 from its remains. There are well-preserved remains to be seen of the Erechtheum, especially the beautiful female figures called Caryatides, supporting the roof of the southern portico. The Temple of the Winds is still tolerably perfect. Its form is an octagon: on each side it is covered with reliefs, which represent one of the principal winds. The choragic monument of Lysicrates also remains. It consists of a pedestal surrounded by a colonnade, and is surmounted by a dome of Corinthian architecture. Outside of the city are the lofty ruins of the temple of the Olympian Zeus. Of 120 pillars 16 remain, but none of the statues are in existence. The pedestals and inscriptions are scattered here and there, and partly buried in the earth. The main body of the temple of Theseus has remained almost entire, and it now contains a collection of ancient sculpture. On the hill where the famous court of Areopagus held its sittings are to be seen steps hewn in the rock, places for the judges to sit, and over against these the stations of the accuser and the accused. The hill became a Turkish burial-ground, and is covered with monuments. The Pnyx, the place of assembly for the people, not far from the Areopagus, is very nearly in its primitive state. One may see the place from which the orators spoke hewn in the rock, the seats of the scribes, and at both ends the places of those officers whose duty it was to preserve silence, and to make known the events of public deliberations. The niches are still to be seen where those who had any favor to ask of the people deposited their petitions. The spot occupied by the Lyceum is only known by a quantity of fallen stones. The ground occupied by the gardens of the Academy is still well cultivated and fertile. The long walls are totally destroyed, though the foundations are yet to be found on the plain. The Piræus has scarcely anything of its ancient splendor, except a few ruined pillars scattered here and there, though it promises to become a handsome modern town, and has again a harbor filled with shipping, engaged in carrying on a considerable trade. The most thorough investigation of the places among the ruins of Athens worthy of attention is contained in Leake's 'Topography of Athens, with Some Remarks on its Antiquities' (1821, with an atlas in folio; 2d ed. 1841). Other valuable works on the same subject are such as Stuart and Revett's 'Antiquities of Athens' (1762–1816); Dodwell's 'Tour Through Greece'; Wordsworth's 'Athens and Attica'; Curtius' 'Attische Studien'; Dyer's 'Ancient Athens'; and Wachsmuth's 'Die Stadt Athen in Alterthum.' Ancient Athens is believed to have had a population of not more than 200,000.

Athens was at no time so splendid as under the Antonines, when the magnificent works of from eight to ten centuries stood in view, and the edifices of Pericles were in equal preservation with the new buildings. Plutarch himself wonders how the ancient structures could retain such a perpetual freshness. Pausanias, who traveled in Greece at this time, that is, in the 2d century after Christ, has left a valuable account of the state of Athens as he saw it. Many of the edifices of later times were due to foreign potentates, rulers of Pergamus, of Egypt, of Rome. But after a time the wholesale robberies of collectors, the removal of great quantities of the works of art, first to Rome and then to Constantinople, Christian zeal, and the attacks of barbarians, made sad

1. Acropolis from the Hill of the Museum. 2. Parthenon (west front) restored.

inroads among the monuments. When Justinian closed the schools of the philosophers in 529, Athens soon ceased to be a centre of intellectual activity. The Parthenon was turned into a church of the Virgin Mary, and Saint George stepped into the place of Theseus. In 1456 Athens fell into the hands of the Turks, under whom the Parthenon became a mosque. When it was selected as the capital of the modern kingdom in 1833, it had only a scanty population inhabiting a scene of ruins.

Modern Athens lies mostly northward and eastward from the Acropolis, and consists of well-built streets, the most important being Piræus, Athens, Stadion, and University. Among the principal buildings are the royal palace, the university, the academy of science and art, the polytechnic, the national museum, the observatory, the chamber of deputies, exhibition buildings, new theatre, and new library. The palace (1838–43) is a conspicuous but unattractive building of limestone with marble portico. The National University, founded in 1837, is a handsome structure, with a large number of teachers and an attendance of over 2,000 students. The academy is a beautiful building faced with Pentelic marble; the new National Library is also a fine building, containing over 200,000 volumes, and so is the Polytechnic School, part of which is occupied as a museum, and contains the Schliemann and other collections. Saint Nicodemus, the largest and finest of the Byzantine churches (62 feet long by 45 wide), dates from the 11th century. Athens is well equipped with educational institutions, possessing besides the National University and Polytechnic School, a number of high schools, a gymnasium, a school for the higher education of girls and female teachers, orphanages for boys and girls, and four foreign archæological schools or institutes, the French, German, American, and British. The city is governed by a mayor elected every four years, with a council of 18 members. There is a municipal fire department and the city controls the gas, electric light and waterworks, but the water supply is so inefficient that the inhabitants are obliged to have recourse to water-carriers. Street cars cross the city in all directions and it is an important railroad centre. The bathing resort of Phaleron, adjoining the Fort of Piræus, is connected with Athens by a suburban railroad. The city has very little manufacturing, although the financial centre of the kingdom, and its trade is concerned chiefly with its own requirements. Pop. (1896) 111,486.

Ath'ens, Ohio, a town and county-seat of Athens County, situated on the Baltimore & O. S. W., the Toledo & O. C., the Hocking V. & T., and the Kanawha & M. R.R.'s. Athens was settled in 1797, and in 1811 was incorporated. The government is by a mayor, elected every two years, and a village council. The town owns and operates the waterworks. It is the seat of Ohio State University (q.v.) and of the Southeastern Ohio Insane Asylum, and manufactures lumber and brick. Pop. (1900) 3,066.

Ath'ens, Tenn., a town and county-seat of McMinn County, on the Southern R.R. half way between Knoxville and Chattanooga, 56 miles to either city. The town was incorporated in 1868. It has woolen mills, spinning mills, lumber factories and two newspapers. It is the seat of Grant Memorial University (q.v.). Pop. (1904) 2,600.

W. T. Lane,
Editor 'Athens Post.'

Ath'ens, Texas, city and county-seat of Henderson County; at the junction of the Saint Louis & S. and the Texas & N. O. R.R.'s., 75 miles from Dallas. It is an important manufacturing town and has pressed brick, fire brick and tile works, cotton oil mills, potteries, and other industries. There are excellent public schools, four churches, and two national banks. Athens was first settled in 1850 and was incorporated as a city in 1901. Pop. (1900) 3,200.

Ath'ens of America, a name frequently applied to Boston, Mass., on account of her intellectual and literary pre-eminence.

Ath'ens of the North, a name given to Edinburgh, Scotland, on account of the picturesqueness of the site and beauty of architecture, as well as intellectual distinction. Copenhagen also is often so called.

Ath'ens of the West, a name given to Cordova, Spain, the centre of Arab learning and culture in the Middle Ages.

Ath'ens, American School at, an institution for classical study, founded in Athens, Greece, in 1882. It is affiliated with the Archæological Institute of America, and is managed by a committee representing the colleges in the United States which contribute to its support. The building was erected by means of private subscriptions, on grounds donated by the Greek government, and the institution has an endowment of $50,000.

Ath'erine, a small fish, from five to six inches long, called also the sandsmelt.

Atheroma, a term sometimes applied to the process of arteriosclerosis as a whole, but best restricted to that type of chronic degeneration of the blood vessels associated with softening of the tissues and their infiltration with the necrotic products, fat cholesterin, etc. See Arteries, Diseases of.

Atherton, Charles Gordon, American politician: b. Amherst, N. H., 1804; d. Manchester, N. H., 15 Nov. 1853. He was graduated from Harvard in 1822, was a member of the New Hampshire legislature for five years and speaker of the lower house for four, and in 1837–43 was a Democratic representative from New Hampshire in Congress. In 1843–9 and 1852–3 he was a member of the Senate. On 11 Dec. 1838 he introduced in the house the so-called "Atherton gag" resolution, which provided that all bills or petitions on the subject of slavery should be "laid on the table without being debated, printed, or referred." The resolution was passed by a vote of 126 to 73, and remained in effect until 1844. It was resolutely opposed by J. Q. Adams, who advocated the "right of petition." Adams was ultimately victorious, and on 3 Dec. 1844 the 21st rule of the House, providing that no paper praying the abolition of slavery or the slave trade should be in any wise entertained, was abolished by a vote of 108 to 80. See Gag-rules.

Atherton, George William, American educator: b. Boxford, Mass., 20 June 1837; d. Bellefonte, Pa., 24 July 1906. He worked his way

through Phillips Exeter Academy and Yale College; was professor of political economy and constitutional law in Rutgers College, N. J., in 1869–82; was admitted to the bar of New Jersey in 1878; and from 1882–1906 was president of the Pennsylvania State College.

Ath'erton, Gertrude Franklin (Horn), American novelist: b. San Francisco in 1857. Since the death of her husband she has chiefly pursued a literary career. She has written 'The Doomswoman' (1892); 'Before the Gringo Came' (1894); 'A Whirl Asunder' (1895); 'Patience Sparhawk and Her Times' (1897); 'American Wives and English Husbands' (1898); 'The Californians' (1898); 'A Daughter of the Vine' (1899); 'The Valiant Runaways' (1899); 'Senator Worth' (1900); 'The Aristocrats' (1901); 'The Conqueror' (1902); 'The Splendid Idle Forties' (1902), a revision of 'Before the Gringo Came'; 'The Bell in the Fog' (1905).

Ath'erton, a manufacturing town of England, Lancashire, 13 miles northwest of Manchester, containing cotton-factories, collieries, iron-works. Pop. (1900) 16,200.

Ath'erton Res'olu'tions. See Gag Rules.

Athetosis, a peculiar movement, usually of the hands and fingers, occurring after some destructive process in the brain. It is seen in the young who have suffered severe injuries at birth and sometimes following an apoplectic stroke.

Ath'letes (Greek, *athlētai*), combatants who took part in the public games of Greece; also young men who went through the gymnastic exercises to harden themselves and to become fit to bear arms. In a narrower sense athletes were those who made the athletic or gymnastic exercises their principal business, particularly wrestlers and boxers. Their business was to contend at the public festivals, and they regulated their habits of life for this end. Not only the applause of the people, but also crowns and statues, were conferred upon the victor. He was led in triumph; his name was written in the public records; and poets sang his praise. He also received peculiar privileges, had a yearly pension, and the foremost seat at the sacred games.

Athlet'ics, or **Athletism,** is the exhibition of man's physical prowess in games of skill and endurance, and though in the passing centuries it has undergone many phases, it is practically the same to-day as when the Olympian games, which were resumed at the Pan-American Exhibition at Buffalo in 1901, were originally given 2,500 years ago, and Greece was in her prime. Then not only Greek met Greek, but the influence of the Olympian, Pythean, Nemean and Isthmian games was felt to the farthest extremities of Asia. After the fall of Rome, the mantle of physical prowess which that nation had inherited from the Greeks, fell upon the shoulders of the sturdy Norseman, whose chief glory was in his individual capacity to bear unflinchingly the stress and strain of contests and the elements. They bred into the bone, the hardihood, and love of personal achievement which in turn carried the current through the Dark Ages, even into those of the exaggerated chivalry, which Cervantes killed with ridicule in 'Don Quixote.' The spirit of the Greek, Roman, and Norseman planted its seeds in the hardy Anglo-Saxons, who in turn transplanted them into Virginian and New England soils on the northern continent of America, where its influence has been felt, even to the entire disappearance of the softer Latin races' supremacy. It is not surprising, therefore, that, with the disappearance of the earlier modes of life of the first settlers, calling for all the physical strain that the human frame was capable of, and the return of the comparative leisure which in early youth now surrounds the American universities and colleges, there has re-appeared a yearning after opportunities to supply, artificially, if so it must be, the stress and contest, physical effort, and the proof of supremacy of the earlier ages, when such conditions were compulsory. It was in the blood, and it came out, much to the nation's benefit. First in the form of isolated college and club contests, and subsequently in such a volume as to need a separation of contests into classes and the creation of an especial federation of the separate units, to regulate and control it. In the beginning, athletics developed in this or that college, or university, or club, acting separately and indiscriminately in its scope. Ultimately the lines of natural cleavage forced athletics into its two great branches: one out-doors, commonly known as track-events; the other, those carried on in a gymnasium. The out-door events are those which are now usually meant when the term athletics is used. The development of these came tentatively. First one college, or university, or club, then another, organized outdoor contests, until at length the net was spread over all the rising generation, and the Amateur Athletic Union was formed, whose fundamental rule is that "no person shall be eligible to compete in any athletic meeting, game or entertainment given or sanctioned by this Union who has (1) received or competed for compensation or reward, in any form, for the display, exercise or example of his skill in or knowledge of any athletic exercise, or for rendering personal service of any kind to any athletic organization, or for becoming or continuing a member of any athletic organization; or (2) has entered any competition under a name other than his own, or from a club of which he was not at that time a member in good standing; or (3) has knowingly entered any competition open to any professional or professionals, or has knowingly competed with any professional for any prize or token; or (4) has issued or allowed to be issued in his behalf any challenge to compete against any professional, or for money; or (5) has pawned, bartered or sold any prize won in athletic competition; or (6) is not a registered athlete. Nor shall any person residing within the territory of any active member of this Union be eligible to compete for or to enter any competition as a member of any club in the territory of any other active member of this Union, unless he shall have been elected to membership in such club prior to 1 April 1891; provided, however, that this restriction as to residence shall not apply to undergraduates connected with any allied college athletic organization.

"No one shall be eligible to compete in any athletic meeting, games or entertainment given or sanctioned by this Union, unless he shall be

a duly registered athlete, a member of the organization from which he enters, and shall not have competed from any club in this Union during a period of three months next preceding such entry; nor shall any member of any club in this Union, or any club in any district in this Union be allowed to compete in case he has within one year competed as a member of any other club then in this Union, except with the consent of such other club, which consent shall be filed with the registration committee of his district prior to such competition unless such other club shall have disbanded or practically ceased to exist; provided that the requirements of this section shall not apply to any athletic meeting, games, or entertainment, the entries for which are confined to the club or organization giving such meeting or entertainment.

"No athlete who has been released from a club which is a member of this Union, and who competes for another club directly thereafter, shall be allowed to compete again for the club he was released from for one year from the date of his release, except that the club has disbanded or ceased to exist.

"No person shall be eligible to compete for or enter any competition as a member of any club in the territory of any active member of this Union, unless he shall have resided within the territory of said active member at least four months previous to entering for competition; nor shall any person be eligible to enter or compete in any district championship meeting unless he shall have been a bona-fide resident of such district for at least six months prior to the holding of such championship meeting; and no person shall be eligible to compete in a championship meeting of more than one district in one year. The restrictions contained in this section shall not affect the eligibility of an undergraduate connected with any allied college athletic organization who shall have been elected to membership in any club of this Union prior to 20 Nov. 1899, to represent such club as long as he remains an undergraduate; nor shall these restrictions apply to an undergraduate competing for any college belonging to an allied body."

The Amateur Athletic Union (A.A.U.) of the United States has jurisdiction over the following out-door sports among amateurs: Baseball, bicycling, boating, bowling, cross-country running, football, hurdle-racing, jumping, lacrosse, lawn-tennis, pole-vaulting, putting the weight, quoits, racquets, running, skating, sculling, swimming, throwing the hammer, throwing weights, tug of war, and walking. The Union consists of the *Metropolitan Assoc.*, comprising the States of New York and New Jersey, north of Trenton; the *New England Assoc.*, comprising Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, and Connecticut; the *Atlantic Assoc.*, comprising New Jersey, south of and including Trenton, Delaware, Maryland, Pennsylvania, West Virginia, District of Columbia, Virginia, North Carolina, South Carolina, Florida, and Georgia; the *Central Assoc.*, comprising Ohio, Illinois, Indiana, Michigan, Wisconsin, Iowa, Minnesota; the *Pacific Assoc.*, comprising California, Arizona, Nevada, Utah, Idaho, Oregon, and Washington; the *Southern Assoc.*, comprising Alabama, Louisiana, Florida, Mississippi, Texas, Georgia, and Tennessee; the *Western Assoc.*, comprising Missouri, Wyoming, Arkansas, Oklahoma, South Dakota, North Dakota, Indian Territory, Kansas, Kentucky, New Mexico, and Colorado; and the *Pacific Northwest Assoc.*, comprising Idaho, Montana, Oregon, Washington, and Alaska. All its meetings are under the direction of "a games committee," one referee, two or more inspectors, three judges at finish, three or more timekeepers, a starter, a clerk of the course, a scorer, and a marshal; besides which all the conditions and restrictions for various events: the number of throws allowed, the size of the area of preliminary effort, as in shot-putting, etc., are subject to definitions from time to time promulgated, and imposed, by virtue of the authority of the A. A. U. in meeting assembled.

The athletic events at outdoor field meetings are for 100, 220, 440, and 880 yards run; 1 and 5 mile run; 1 and 3 mile walk; 2 mile bicycle ride; pole vault for height; running high and broad jumps; throwing 16-pound hammer; throwing 56-pound weight, for distance; putting 16-pound shot; 120 yards hurdle-race, 10 flights 3 feet 6 inches high; 220 yards hurdle-race, 10 flights 2 feet 6 inches high; and at indoor meetings, for runs of 75, 150, 300, 600, and 1,000 yards; 2 mile run; three quarter mile and 4 mile walk; standing, broad, and high jumps; three standing broad jumps; running hop, step, and jump; pole vault for distance; throwing 56-pound weight for height; putting 24-pound shot; 200 yards hurdle-race, 10 flights 3 feet 6 inches high; 300 yards hurdle-race, 10 flights 2 feet 6 inches high; and tug of war, 4 men, unlimited weight. The associations award in each year three prizes for all-round excellence to the three athletes making the highest three aggregate scores, and two prizes for individual excellence. The Intercollegiate Association of Amateur Athletes of America is the governing body of intercollege athletics. Its championships must be won at the annual meeting. See also GYMNASTICS; EDUCATIONAL ATHLETICS.

Bibliography.— Stonehange, 'Rural Sports,' illustrated; Cassell, 'Sports and Pastimes,' with 700 illustrations; 'Athletics' (by various authors) in the 'Encyclopedia of Sport'; James Sullivan, 'Athletic Almanacks' (issued yearly).

Athlone, ăth-lōn', a town of Ireland, on the Shannon, about 67 miles west by north of Dublin. It is divided by the river into two nearly equal parts, which communicate by a handsome stone bridge of five arches. It is one of the chief depôts for troops and military stores; and the barracks, occupying a height above the river, can accommodate 1,500 men, and have attached an ordnance yard, magazines, and armory provided with 15,000 stand of arms. By means of a canal the Shannon has been rendered navigable for 71 miles above the town, which, being also terminus of four important railways, carries on a brisk trade. The chief industrial establishment is an extensive woolen factory, and there are also large saw-mills. Pop. (1891) 6,742.

Ath'ol, Mass., a town in Worcester County, on Miller's River, and the Boston & A., and Fitchburg R.R.'s; 26 miles northwest of Worcester. It contains several villages, has electric railways connecting with the suburbs, and is principally engaged in the manufacture of cotton warps, shoes, sewing-silk, fine mechanical tools, matches, organ-cases, pocket-

books, billiard-tables, and furniture. The town has two national banks, public library, high school, several weekly and monthly periodicals, and a property valuation exceeding $4,000,000. Pop. (1900) 7,061.

Athol, ăth'ŏl, or **Athole,** a mountainous and romantic district, situated in the north of Perthshire, Scotland. It gives the title of duke to a branch of the house of Murray, and the duke owns the greater part of the district.

Athor, a'thôr, Hathor, or **Hether,** an Egyptian goddess, identified with Aphrodite (Venus). Her symbol was the cow bearing between its horns the solar disk and hawk feather plumes. Her chief temple was at Denderah. From her the third month of the Egyptian year derived its name.

Athos, now *Hagion Oros* or *Monte Santo* (Holy Mountain), a high mountain in European Turkey, forming the extremity of a long chain of mountains which runs through a peninsula jutting into the Archipelago. The peninsula is about 30 miles long and 5 miles broad. It is covered with forests of various kinds of trees, and with vineyards and plantations of olive and other fruit-trees. The surface is very irregular, and the coast displays numerous creeks and inlets of the sea. In ancient history the peninsula is mentioned chiefly on account of the shipwreck which here befell the Persian fleet under Mardonius in 493 B.C., and on account of the canal which, in order to avoid a similar calamity, Xerxes caused to be cut through the isthmus that joins the peninsula to the mainland. The whole peninsula, as well as the mountain, which is about 6,700 feet above the level of the sea, receives the name of Athos. It contains some 20 monasteries, and a multitude of hermitages, inhabited by about 6,000 monks and hermits, of the Order of St. Basil. They are extremely industrious: they diligently cultivate the soil, grow vines and olives, vegetables, etc., and actively engage in fishing, and they also carve statues of the saints, *Agni Dei,* crucifixes, rosaries, etc., which they send to the small town of Karyes, on the mountain, where weekly markets are held, and to the rest of Europe, especially to Russia. They also collect alms to pay their heavy yearly tax to the Porte. There is an academy in which the younger monks receive instruction in various subjects. The libraries of the monasteries are rich in literary treasures, particularly in manuscripts, partly procured from Constantinople before its conquest by the Turks, partly presented to them from the same place, and partly written by the laborious monks. Many books have been brought thence to the great collections at Paris, Vienna, etc., and the rest are but little used among the monks themselves. Their monasteries and churches are the only ones in the Ottoman empire which have bells. Every nation belonging to the Greek Church has here one or more monasteries of its own, annually visited by pilgrims from Russia, Servia, Bulgaria, etc., as well as from Greece, Asia Minor, and Constantinople. The privileges which the members of the various establishments enjoy they owe to Murad II., who, on account of their voluntary submission, even before the capture of Constantinople, granted them his protection. Hermits were established on Athos in the middle of the 9th century, and the first monastery, that of St. Lavra, was founded by the monk Athanasius in 968.

Athos, a'tōs', a character who figures in Dumas' 'Musketeer' novels. He is one of the three guardsmen associated with d'Artagan.

Athy, ă-thī', a market-town in Ireland, 37 miles southwest of Dublin, with Protestant and Roman Catholic churches, extensive county jail, police barracks, etc. It has a large trade in corn, by canal and river, and is an important railway-station.

Atitlan, ä'te-tlän', a lake, mountain and town of Central America, in Guatemala. The lake is about 24 miles long and 10 broad; the mountain an active volcano, 12,160 feet high. The town, known also as Santiago de Atitlan, is located on the side of the mountain, and is chiefly known for its medicinal springs. Pop. (1903) about 10,000.

At'ka Mackerel. See GREENLING.

At'kinson, Edward, American economist: b. Brookline, Mass., 10 Feb. 1827; d. Boston, 11 Dec. 1905. He invented a cooking-stove called the «Aladdin Oven,» and was president of the Boston Manufacturers' Mutual Fire Insurance Co. since 1878. His wide reputation was due chiefly to the fact that for 40 years he was a prolific writer of pamphlets on economic, commercial, and political subjects, including banking, competition, railroads, fire-prevention, economic legislation, industrial education, the money and tariff questions, and colonial expansion. He vigorously opposed the war in the Philippines, and during 1899–1900 published the 'Anti-Imperialist' in support of his views. The following is a selected list of his more important publications: 'Cheap Cotton by Free Labor' (1861); 'Collection of Revenue' (1866); 'Reform of the Legal-Tender Act' (1874); 'The Fire-Engineer, the Architect, and the Underwriter' (1880); 'Distribution of Products' (1885); 'The Margin of Profit' (1887); 'Taxation and Work': 'Science of Nutrition'; 'Prevention of Loss by Fire.'

At'kinson, George Francis, American botanist: b. Raisinville, Mich., 26 Jan. 1854. He was educated at Olivet College, Michigan, and Cornell University, and taught general zoology, biology, and entomology in the universities of North Carolina, South Carolina, and the Alabama Agricultural and Mechanical College. He was assistant and professor of cryptogamic botany at Cornell, 1892–6, and professor of botany there since 1896. He has written: 'Biology of Ferns'; 'Stories of Plant Life'; Studies of American Fungi.'

At'kinson, John, American clergyman: b. Deerfield, N. J., 6 Sept. 1835; d. Haverstraw, N. Y., 8 Dec. 1897. He entered the Methodist ministry in 1853, and held pastorates in Newark, Jersey City, Chicago, Bay City, Adrian, and Haverstraw. He was the author of the hymn 'Shall We Meet Beyond the River.' He wrote: 'The Living Way' (1856); 'Memorials of Methodism in New Jersey' (2d ed. 1860); 'The Garden of Sorrows' (1868); 'Centennial History of American Methodism' (1884).

At'kinson, John Christopher, noted English clergyman and antiquary: b. Eddhangor, England, 1814; d. 1900. He was for half a century vicar of the parish of Danby in the North Riding of Yorkshire, which he has described in

his delightful 'Forty Years in a Moorland Parish' (1891). He wrote much on natural history, and his 'Walks, Talks, Travels and Exploits of Two School-Boys' (1859); 'Play Hours and Half Holidays' (1880); 'British Birds' Eggs and Nests' (1861), and 'The Last of the Giant Killers' (1891), have been widely read.

At'kinson, Thomas, American bishop: b. Mansfield, Va., 6 Aug. 1807; d. Wilmington, N. C., 4 Jan. 1881. He was graduated from Hampden-Sidney College, Virginia, in 1825, and practised law for nine years. Ordained priest in the Episcopal Church in 1837, he served as rector in Norfolk and Lynchburg, Va., and Baltimore, Md., whence he was elected third bishop of North Carolina, 26 May 1853. He was an able administrator and prominent in the councils of his Church. He published various sermons and Episcopal charges.

Atlanta, the capital of Georgia and the county-seat of Fulton County, is situated at the foot of the Appalachian chain of mountains on the ridge dividing the watershed of the Atlantic Ocean from that of the Gulf of Mexico. The altitude of 1,050 feet at the lowest point and 1,100 feet at the highest, makes the climate cooler than the latitude, 33° 44′ 58.8″, would indicate, and the air has a bracing effect conducive to mental and physical vigor. This commanding site was determined by the building of railroads in the first half of the 19th century. The village of Marthasville was first a terminus of the line from Savannah and Macon. As one road after another centred there, the place grew rapidly; its destiny as a business centre was foreseen, and the name changed to Atlanta. Here eastern and western traffic meet. Atlanta was an important strategic point in the Civil War. In 1861 it became a depot of Confederate military supplies, and this made it an objective point in Gen. Sherman's march to the sea. After a siege of several weeks he occupied the city (see Jonesboro, Battle of, and Fall of Atlanta), and by his order it was burned 17 Nov. 1864. In later years Gen. Sherman described the strategic position of Atlanta by comparing it to the wrist of a hand whose fingers reached the five principal ports of the gulf and south Atlantic coast. During the Spanish war the city was headquarters for the Department of the Gulf. Twice the test of war has approved the site, and twice a city has been built on the same spot. In 1865 the military government of Georgia was established there. The legislature removed from Milledgeville, and Atlanta became the capital of the state during the reconstruction era. It was made the permanent capital by vote of the people in 1877, and the capitol building was completed in 1889 at a cost of $1,000,000. The exterior is of oolitic limestone, and the interior is ornamented with Georgia marble. The Cotton Exposition of 1881, projected by citizens of Atlanta, was a rallying point for southern industry. Atlanta now became the business centre of the southeastern States and shared the general growth. From 39,000 in 1880, its population grew to 89,872 in 1900. At the beginning of 1903 the number of buildings indicated 100,000 population. A postal census then gave a population of 110,000 in the city and suburbs. The city assessment showed $57,000,000 of taxable wealth. A second exposition, held in 1895, greatly stimulated the growth of business. Bank clearings increased from $56,000,000 in 1894 to $131,000,000 in 1902. In same period bank deposits grew from less than $4,000,000 to $12,750,000. Business has recently increased four times as fast as population, although that has grown at the rate of 4 per cent a year. The increase of postal receipts in 1902 was 16 per cent, and that of bank clearings 18 per cent. Postal receipts for the year ending 30 June 1902, were $415,546.14. Congress has appropriated $200,000 for an entire block of ground upon which to erect a $1,000,000 post-office. The wholesale and retail trade of the year 1902 is estimated at $50,000,000. The mule market is one of the most important in the country. Sales for the year 1902–03 are estimated at 62,500 head, valued at $7,000,000. Total trade and manufactures, $80,000,000. As a manufacturing centre, Atlanta's strength is in variety. The census of 1900 reported 395 establishments with $16,085,114 of capital, 9,368 wage-earners, $3,106,039 total wages, and $16,721,899 of products. An investigation made by the Atlanta Chamber of Commerce in December 1902, showed that the products had increased to $20,400,000, the wage-earners to 11,000, and the total wages to $3,600,000. The most important products are cotton goods, fertilizers, gins, engines, car-wheels, machinery, lumber, sheet-metal work, terra-cotta, brick, wagons, carriages and buggies, furniture, confectionery, crackers, cigars, coffins, chemicals, printing, lithographing, electrotyping, engraving, paper-bags, flour and meal, paints, varnish, cotton-seed oil and cake, ice, harness, belting, hosiery, suspenders, underwear, neckwear, woolen goods, clothing, trunks, and condiments.

The factories of the city use 45,000 horse-power furnished by steam and electricity. A massive masonry dam is under construction at Bull Sluice Shoals on the Chattahoochee, and a plant costing $2,000,000, to be completed by the middle of 1904, will deliver 11,000 horse-power of electric current in the city. This has given a new impetus to manufacturing, much of the additional power having been taken in advance of completion. Atlanta's central position has made it southern headquarters for large business concerns. It is the third insurance centre of the United States, with premium collections estimated at $8,000,000 per annum, and is headquarters for the railways, telegraphs, telephones, and the large industrial corporations doing business in the southern or southeastern States. The concentration of these interests has created such a demand for quarters that Atlanta has more fire-proof office buildings than any other southern city. A fire-proof hotel with over 300 rooms was recently completed. With other excellent hotels, Atlanta has been famous for many years as "A Convention City." Atlanta is the most important centre of publication for newspapers and periodicals in the southern States. The postal receipts for second-class matter were $44,064.76 in the fiscal year ending with June 1902, exceeding that of Brooklyn, Baltimore, Buffalo, Washington city, Omaha, New Orleans, Louisville, and Indianapolis.

The public school system embraces grammar schools and high schools, with 14,000 pupils. Three business colleges have 700 students. Medical and dental colleges have 800. Two female colleges, a female seminary, and several select schools for boys have an attendance of 550

The Georgia Institute of Technology, with 481 students, is the most important institution for higher education. It has textile, mechanical engineering, and electrical engineering schools, and machine-shop practice, in addition to literary and scientific courses. The total number of students in these institutions for white youth is 2,500. A site has been given and funds are partially raised for a Presbyterian university, the total investment of which will be $1,000,000.

There are six institutions for the higher education of colored youth, with a total attendance of 2,265. They include literary and scientific schools, theology, industrial training, and a training school for nurses. Charities are numerous and include such educational features as free kindergartens, night schools, and three orphan asylums. Grady Hospital is supported by the city; St. Joseph's Infirmary by the Roman Catholics, and the Presbyterian Hospital by the Presbyterians. Private hospitals or sanatoriums are numerous and well equipped. There are two theatres with 2,500 and 2,000 seating capacity, and two lyceum or lecture associations. Carnegie Library is a white marble building in classic style, and contains 20,000 volumes. The book circulation is 11,000, one fourth among juveniles. There are 131 churches, including missions, and the attendance in fair weather averages 25 per cent of the population. The total membership exceeds a third of the population. Railway facilities include 10 radiating lines, five of which belong to the Southern Ry., and three controlled by the Louisville & N. system. A union depot to cost $900,000 is under construction. Belt lines complete the terminal system. Local transportation is unified in a system of well-equipped street railways, covering 142 miles of track, 100 miles within the city, the rest extending eight miles out. The area of the city is 11 square miles, and the boundary a circle of 3½ miles diameter, extended in two suburbs. Street improvements since 1880 cost $3,807,667, including 100 miles of sewers, 63 of paved streets, 227 of sidewalks. Six miles of streets are paved with asphalt, the remainder with granite blocks, macadam, and vitrified brick. The city waterworks takes its supply from the Chattahoochee River above Peachtree Creek, in a sparsely populated district. By settling and filtration water is purified. Two engines of 15,000,000 gallons daily capacity each pump it into the city. The consumption in 1902 was 8,966,000 gallons a day. For domestic use water is supplied at 10 cents per thousand gallons. At this rate, with some reduction to manufacturers, the city makes a profit. Fire, police, sanitary, and other city departments are well equipped and efficient. The city government is administered by a mayor and general council. Appropriation bills are voted separately by two legislative branches, and the mayor has a veto. Bonded debt is limited by State Constitution to 7 per cent of the taxable wealth. The charter requires a sinking fund to retire all bonds in 30 years from date of issue. Atlanta is one of ten cities designated by the secretary of the treasury whose bonds might be used as security for federal deposits. The tax rate is 1¼ per cent and the assessment averages 60 per cent of actual value.

The cool and invigorating climate makes Atlanta a desirable place of residence, the mean summer temperature being 77; winter 44. Streets are made attractive by grassy lawns and shade trees. Grant Park, Piedmont Park, Lakewood, East Lake, Ponce De Leon Spring, and the Chattahoochee River are outing resorts. A bill has been introduced in Congress to make a national military park on the battle ground north of the city. Public spirit is strong in Atlanta. The Chamber of Commerce, Clearing House Association, Credit Men's Association, Manufacturers' Association, and Freight Bureau are organs for concerted action among business men. The Greater Georgia Association, projected by the Atlanta Chamber of Commerce, unites the efforts of Georgia towns, cities, and counties to develop the resources of the State. Fraternal and social organizations are numerous and active. Religious denominations are well organized.

W. G. Cooper.

Atlan'ta University, a co-educational (non-sectarian) institution, in Atlanta, Ga., organized in 1869. In 1905 it had 18 professors, 340 students, 12,000 volumes in the library, grounds and buildings valued at $250,000; productive funds, $54,000; benefactions, $36,000, and an income of $54,000, graduates 508.

Atlantes, ăt'-lăn'tēz, in architecture, colossal statues of men used instead of pillars to support an entablature. Roman architects called them *telamones* (Greek).

Atlan'tic, Iowa, a city and county-seat of Cass County, situated on the Chicago, R. I. & P. R.R., 80 miles southwest of Des Moines. It has various manufacturing interests, including iron and bridge works, planing mills, canning factories, starch-works, soap-factory, and two machine shops. It was chartered as a city in 1869. Pop. (1900) 5,046.

Atlan'tic City, N. J., a city and seaside resort in Atlantic County; on the Atlantic Ocean and on the Reading and the Pennsylvania R.R.'s. It is built on a long, sandy island, known as Absecom Beach, 60 miles southeast of Philadelphia. The island stretches along the coast for 10 miles; has an average width of three fourths of a mile, and is from four to five miles from the mainland. At the north end is the Absecom Light, well known to coastwise sailors. The city has several miles of bathing beach, a magnificent promenade on the ocean front, nearly 100 hotels and boarding houses, electric lights, public schools, churches of the principal denominations, seven national banks, and daily, weekly, and monthly periodicals. It is probably the most important all-the-year-round resort in the United States, its splendid climate giving it a large popular patronage even in the dead of winter. The assessed property valuation exceeds $14,000,000. A fire in April 1902 destroyed many hotels and other buildings and led to a municipal enactment that all structures henceforth erected within the municipal limits must be fireproof. Atlantic City was first settled in 1854. It is governed by a mayor and a city council of 17 elected by popular vote. Pop. (1890) 13,055; (1900) 33,000; (in summer) 150,000.

Atlan'tic Ocean, the vast expanse of water lying between the western coasts of Europe and Africa, and the eastern coasts of North and South America, and extending from the Arctic to the Antarctic Seas. Its greatest breadth is between the western coast of North Africa and the eastern coast of Florida in North America,

GEORGIA SCHOOL OF TECHNOLOGY.

a distance of 4,150 miles. If the Gulf of Mexico, in reality one of its bays, be included, it will extend to 5,000 miles. Its least breadth, between Norway and Greenland, is about 930 miles. Between Cape St. Roque, Brazil, and Sierra Leone, the breadth is 1,730 miles. Its superficial extent has been estimated at 25,000,000 square miles. From the number and extent of its inlets, gulfs, and bays, its coast lines are of great length, the eastern being upward of 32,000 miles, and the western upward of 55,000. Its principal inlets and bays are Baffin and Hudson bays, the Gulfs of Mexico, Honduras, and San Juan, the North Sea or German Ocean, the Bay of Biscay, and the Gulf of Guinea. The principal islands north of the equator are Iceland, the Faroe, and British islands, the Azores, Canaries, and Cape de Verd islands, Newfoundland, Cape Breton, and the West India islands; and south of the equator, Ascension, St. Helena, Trinidad, Columbus, and Tristan da Cunha, the last three being mere rocks.

Currents.— The great currents of the Atlantic are of two kinds, drift and stream. Drift currents are produced by the wind, either by the perpetual or trade winds, or by prevailing winds. Those having the former origin are constant, running always in the same direction, and generally with a nearly equal velocity; those having the latter are not so constant, neither do they always run in the same direction, nor at a similar rate. The drift currents produced by the trade winds are found between the tropics; those resulting from prevailing winds, north and south of the parallels of 30°. Stream currents are due indirectly to the influence of winds, being produced by drift currents, of which they are continuations. As these currents travel for great distances they meet with many obstacles in their course, which result in changes of direction. A stream current may thus be successively propelled by different currents, or consist in the combination of different stream currents. A third kind of currents is produced by the flow of the water to restore the level disturbed by other currents. This is called a current of indraught. The great currents of the Atlantic are the Gulf Stream, the equatorial current — which may be divided into the main equatorial current, the north equatorial current, and the south equatorial currents — the North African and Guinea current, the South connecting current, the Southern Atlantic current, Cape Horn current, Rennel current, and the Arctic current.

The Gulf Stream is a continuation of the main equatorial current, and partly of the north equatorial current, both western drift currents produced by the trade winds. The former passes across the Atlantic to the American coast, upon which it strikes from Cape St. Roque to the Antilles. On being turned by the coast it runs along it at a rate of 30 to 50 miles per day, and sometimes at a higher speed, till it enters the Gulf of Mexico, from which, having previously received part of the waters of the north equatorial current, it issues between Florida and Cuba under the name of the Gulf Stream. It afterward flows nearly parallel to the coast of the United States, separated from it by a belt of cold water. Off Cape Hatteras it spreads into an expanding channel, reaching a breadth of 167 miles, and consisting of three warm sections with two cold belts interposed. On passing Sandy Hook it turns east and continues to be recognizable, partly by the blue color derived from the silt of the Mississippi, till about lon. 30° W., where, with a greatly diminished temperature, it is found flowing nearly due east. The equatorial current, so called from its being under the line, commences on the western coast of Africa, about lat. 10° S., or nearly opposite St. Paul de Loando. From this point it pursues a northwest direction till it makes lon. 0°, when it proceeds due west on both sides of the equator, till it arrives at Cape St. Roque in South America, when it is divided into two branches, one running along the Guiana coast, and into the Gulf of Mexico, as already mentioned, the other along the coast of Brazil, and so called the Brazil current. The latter is reinforced by the south equatorial current, which, however, is not distinctly separable from the main equatorial current. The length of the equatorial current, from the coast of Africa to Cape St. Roque, is 2,500 miles. Its breadth near the commencement is 185 miles; opposite Cape Palmas, 420; and before dividing, about lon. 31° or 32° W., it is 510. Its average velocity, which is greater in summer than in winter, is from 25 to 30 miles a day. The North African and Guinea current originates between the Azores and Cape Finisterre in Spain. It flows in a southeasterly direction, and after sending a mass of water into the Mediterranean it pursues a southerly course to Cape Mesurada, south of Sierra Leone, keeping at a considerable distance from the land. It then flows rapidly for 1,000 miles due east to the Bight of Biafra, where it seems to mingle with the equatorial current. It is led from the west by the Guinea counter current, a back flow of water between the main and the north equatorial currents. The south connecting current strikes across the South Atlantic from the Brazil current, then turns north, and finally joins the great equatorial current. The South Atlantic or South African current originates north of the Cape of Good Hope, from which it flows in a northwesterly direction, at a rate of from 15 to 30 miles a day, and eventually merges into the equatorial current. Cape Horn current flows constantly from the Antarctic and South Seas into the Atlantic Ocean, its general direction being east-northeast and northeast. Rennel current, which is possibly a continuation of the Gulf Stream, enters the Bay of Biscay from the west, curves round its coast, and then turns northwest toward Cape Clear in Ireland. The Greenland or Arctic current runs along the east coast of Greenland to Cape Farewell; having doubled this cape, it flows up toward Davis Strait, from which it receives an inflow of water, and then turns to the south along the coast of Labrador, and continues along the coast of the United States, from which it separates the Gulf Stream by a cold band of water. Immense masses of ice are borne south by this current from the Polar seas, and carried into warmer regions, where they gradually dissolve and disappear. In the interior of the North Atlantic there is a large area comparatively free from currents, lying between 20° and 30° N. and 30° to 60° W. It is called the Sargasso Sea, from the large quantity of sea weed which drifts into it. A similar area exists in the South Atlantic, to which the same name is occasionally applied by

analogy, though it is destitute of sea weed. It extends between 20° and 30° S. and 0° and 25° W. Besides the surface currents, recent investigation has established the existence of a general oceanic circulation, consisting of an under current of cold water flowing from the Poles to the equator, and an upper current of warm water from the equator to the Poles.

The winds of the Atlantic are not peculiar to that ocean, but identical with those that prevail in the same latitudes in the other seas around the globe. The most remarkable of these are the perennial or trade winds, which blow constantly in one direction, namely, from east to west, or nearly so. The tract of the trade winds to the north of a zone, which is almost always found on the north side of the equator, is called the region of the northeast trade wind, from blowing one or two points north of east; that to the south, the region of the southeast trade wind, from blowing south of east. The northeast trade wind blows with less steadiness than the southeast, but toward the West India islands it keeps generally steady between east and northeast. The trade winds are constant only at a considerable distance from land, and become more steady the greater the expanse of water over which they blow.

Depths.— The greatest depth yet discovered in the Atlantic is to the north of the island of Porto Rico, in the West Indies, namely, 27,366 feet. Formerly depths of 40,000 or 50,000 feet were reported, but this was owing to defective sounding apparatus. The geography of the ocean bed is now pretty well known, especially in the North Atlantic. Cross-sections of the North Atlantic between Europe and America show that its bed may be represented as exhibiting two great valleys lying in a northerly and southerly direction, and separated by an intervening ridge. Each of these valleys is about 500 miles in width. The mean depth of the east valley is about 14,000 or 15,000 feet, and it can be traced from the equator to the latitude of the Faroes, where it terminates, or over an extent of 3,700 miles. The west valley has a maximum depth of 16,800 feet, and can be traced from the latitude of the Azores as far north as Greenland, where it bifurcates, the deeper portion pointing north up Baffin Bay. The submarine ridge dividing these two valleys appears to be very uniform in depth below the surface, having 1,600 fathoms of water above it from the Azores to the latitude of the Hebrides. It then rises gradually till at last it culminates in Iceland. On this plateau the Atlantic telegraph cables have been laid, and from it the first specimens of deep-sea mud were brought up. This was found on examination by the microscope to consist to a large extent of calcareous shells (*Foraminifera*), not water-worn, but quite perfect, showing that the water at such depths can have little or no motion. No sandy particles were found in the mud. The South Atlantic is not so well known as the North, but so far as soundings yet prove it has not a greater depth than the latter, the greatest depth found being 2,900 fathoms, in lat. 28° S. It would appear to be separated from the North Atlantic by a rocky ridge, on which rest the islands of Ascension, Fernando de Noronha, and St. Paul. The saltness and specific gravity of the Atlantic differ in various parts, and gradually diminish from the tropics to the poles, and also from within a short distance of the tropics to the equator. In the neighborhood of the British Isles the salt is given as one thirty eighth of the weight of the water. See Ocean Current.

Atlan'tic Telegraph. See Telegraph.

Atlan'tides, a name given to the Pleiades, the seven daughters of Atlas or of his brother Hesperus.

Atlan'tis, or **Atlan'tica,** a large island traditionally asserted to have once existed in the ocean immediately beyond the Strait of Gades; that is, in what is now called the Atlantic Ocean, a short distance west of the Strait of Gibraltar. Homer, Horace, and some others made two Atlanticas, distinguished as the Hesperides and the Elysian Fields, and believed to be the abodes of the blessed. Plato states that an easy passage existed from the one Atlantis into other islands, which lay near a continent exceeding in size all Europe and Asia. Some have thought this America. Atlantis is represented as having ultimately sunk beneath the waves, leaving only isolated rocks and shoals in its place. Geologists have discovered that the coast line of western Europe did once run farther in the direction of America than now; but its submergence seems to have taken place long before historic times. 'The New Atlantis' is the title which Lord Bacon gives to a literary fragment, in which he sketched out an ideal commonwealth.

Atlan'tis, a romance of the antediluvian world, by Ignatius Donnelly (1882).

Atlan'tosau'rus. See Camarasaurus.

Atlas, an extensive mountain system in North Africa, starting near Cape Nun, on the Atlantic Ocean, traversing Morocco, Algiers, and Tunis, and terminating on the coast of the Mediterranean. It is divided into the great and little Atlas. The little Atlas is the range nearest the sea-coast; the great is more inland, and borders on the desert. In fact, however, the two ranges are one and the same system, though sometimes connected only by separate mountains, or ranges of low hills. On the coast, the range skirts the Mediterranean, from Cape Spartel, and the straits of Gibraltar, to Cape Bon, on the northeast of Tunis. The Atlantic shore is sometimes sandy and low, at other times formed by cliffs, which do not attain any great height, except at Cape Ghir. The Mediterranean shore, between Capes Spartel and Bon, is generally rugged, and in places attains a considerable height. Between Cape Bon and the gulf of Gabes it is rocky, but without reaching any great elevation. The southern slope of the Atlas reaches the great desert, from which it is separated by a region of sand hills, shifting with every strong wind, and gradually making encroachments on the fertile lands at the foot of the mountains. On the west of the gulf of Gabes, Mount Nofusa, the last eastern spur of the Atlas, joins Mount Garian, which extends into the regency of Tripoli. The French geographers include within the limits of the Atlas their own province of Algeria, together with the empire of Morocco, and a part of Tunis. The whole area is 500,000 square miles, including a great variety of surface, mountains, valleys, and extensive plains.

The loftiest peaks form a diagonal line, striking across the general course of the mountains from southwest to northeast. This line begins at Cape Ghir, on the Atlantic, which rises almost perpendicularly from the sea to a great elevation. It then stretches away, east of the meridian of Morocco, then turns abruptly northeast, and from this quarter four important rivers take their rise, the Wady Oum Erbegh (Morbeya), the Muluia, the Tafilet, and the Draa. At this precise spot, the loftiest peaks of the whole mass seem to be brought together, and the most elevated chain runs away north. The principal chain traverses a region called the desert of Ansad, the boundary line between Morocco and Algiers. Here the name great Atlas is first applied. The principal chain recurs in Algeria, where its highest part is called Wanashrees, or Warensenis, and terminates on the banks of the Shelliff, whose valley makes a gap in its course. It reappears southwest of Algiers, in the lofty summits of the Jurjura. From this point, the chain follows a direction parallel to the coast, then it dips again to the southeast, and takes the name of the mountains of Wannooga. Further on to the east, we meet it as the Djebel Aures, and approaching the coast again, it penetrates into the territory of Tunis, under the name of Mount Tipara, terminating at Cape Blanco and Cape Zibeb, on the north of the city of Tunis. The highest summits, the Miltsin (11,400 feet), southeast of the city of Morocco, and other mountains near the Wady Oum Erbegh, and the Muluia, are rarely free from snow. The greatest heights of the entire system are the Jebel Ayashi (14,600 feet), and Tamjurt (14,500 feet). The little Atlas is by no means so lofty, its highest peak, Shelia, having an altitude of only 7,611 feet. The great Atlas is the water-shed of the province. The rivers flowing north from this line force their way through the lesser Atlas to the Mediterranean, while those that take their rise on the southern slope are lost in the marshes of the desert. There are several defiles through the Atlas, the best known of which are those of the Beboonan, leading to Terodant in Morocco, and the Biban, or Iron gate on the east, leading from Algiers to Constantine. The geological constitution of these mountains presents old limestone alternating with a schist, oftentimes passing to a well-characterized micaceous schist, or gneiss. The stratification of the gneiss is also very irregular, only presenting organic débris; then come schistose clays, alternating with secondary limestones; then come limestone with white clays, and iron sands resting on blue clay. This formation is particularly developed near Oran, and the plains in which the soil is formed from it are of great fertility. Volcanic rocks have been found in small quantities. There are veins of iron, copper, and lead. Saltpetre is found near Terodant. About 50 miles from the same town, excellent malleable iron is found. At Elala there are copper and silver mines. The vegetation embraces all the varieties of both temperate and tropical climates. The Atlas was known to the ancients, and the Romans formed several colonies in the district.

At'las, an anatomical term applied to the first vertebra of the neck, which supports the head. It is connected with the occipital bone in such a way as to permit of the nodding movement of the head, and rests on the second vertebra or *axis,* their union allowing the head to turn from side to side.

At'las, in Greek mythology, the Titan whom Zeus condemned to bear the vault of heaven. The same name is given to a collection of maps and charts, and was first used by Gerard Mercator in the 16th century, the figure of Atlas bearing the globe being represented on the title-pages of such works.

At'lee, Washington Lemuel, American surgeon: b. Lancaster, Pa., 22 Feb. 1808; d. 6 Sept. 1878. He became noted as a pioneer in ovariotomy and the removal of uterine fibroid tumors, and published 'Ovarian Tumors' (1873) 'Struggles and Triumphs of Ovariotomy' (1875), and a prize essay on 'Fibroid Tumors of the Uterus' (1876).

At'midom'eter, an instrument for measuring the evaporation from water, ice, snow, etc. It consists of two glass or metal bulbs, one of them placed above the other, with which it communicates by a narrow neck. The instrument having been immersed in a vessel of water through a circular hole in which the steam rises, distilled water is gradually poured into the pan above, causing it to sink to the point at which the zero of the stem is on a level with the cover of the vessel. As then the water in the pan gradually evaporates, the steam slowly ascends, the amount of evaporation being indicated in grains on the graduated scale.

Atmol'ysis, the separation of the components of a gaseous mixture by means of diffusion. See DIFFUSION.

Atmom'eter, an instrument invented by Sir John Leslie for measuring the quantity of moisture exhaled in the open air in a given time from any humid surface. It consists of a very thin ball of porous earthenware, from one to three inches in diameter, having a small neck firmly cemented to a long and rather wide tube of glass, to which is adapted a brass cap with a narrow collar of leather to fit closely. It is filled with distilled or pure water, and its cap screwed tightly. It is then suspended out of doors where it is exposed freely to the action of the wind, but sheltered from rain. As the water evaporates from the external surface of the ball, it transudes through its porous substance, and the waste is measured by the corresponding descent of the liquid in the stem. To test the amount of this descent, there is a finely-graduated scale. When the water has sunk to the bottom of the stem, the latter requires to be filled anew.

At'mosphere (Greek, «vaporous sphere»), in ordinary usage, the gaseous envelope that surrounds the earth. The atmosphere consists chiefly of the gases oxygen and nitrogen, not chemically combined, but mechanically mixed in the proportion of about 21 volumes of oxygen to 79 of nitrogen. It also contains small quantities of carbon dioxid, organic matter, water vapor, argon, and other substances. (For a more precise statement of its composition, see AIR.) At the surface of the earth it has a density of about 1/800th of that of water, though this varies somewhat with the height above the sea level at which the determination is made, and with the temperature and barometric pressure prevailing at the time. The presence of

free nitrogen in the atmosphere may be attributed, probably, to the comparative inertness of that gas, so far as any tendency to form chemical compounds is concerned. The presence of free oxygen cannot be explained in this manner, however, because oxygen is one of the most active chemical substances known. It appears more probable that oxygen is present in the free state simply on account of the immense quantity of that element that the earth contains. In past geological times, it combined with practically all of the oxidizable minerals that were near enough to the surface of the earth to be accessible to it, and the present supply of free oxygen in the atmosphere must be regarded as merely the excess of that element that remained unused, after all the possible oxidations had been effected. According to this view, the earth (at least in its more superficial parts) is a gigantic, burned-out cinder; and this accords with the estimates that chemists and geologists make, that nearly one half of the weight of the earth's crust consists of oxygen. It is likely that in past ages, and particularly in the carboniferous period when the vegetation that gave rise to our modern coal fields was flourishing, the quantity of carbon dioxid present in the atmosphere was considerably greater than at the present time. Part of this gas was absorbed by plants, its carbon being stored in the coal beds and its oxygen returned to the air; but it is likely that by far the greater portion combined with lime and other similar earths to produce the present vast deposits of limestone and other carbonated minerals and rocks. At the present day, carbon dioxid is being absorbed from the atmosphere by plants, and returned to it again by animals, and by factories in which coal is burned. We have no means of knowing whether the balance is being preserved, so far as this constituent of the atmosphere is concerned, or not; because the mass of the entire atmosphere is too vast for the composition to be sensibly changed by these causes, since the time when exact analyses became possible.

Galileo observed that water cannot be drawn up by a suction pump or other equivalent device, to a greater distance than about 34 feet. He did not succeed in explaining the existence of this limiting height, but his friend and amanuensis Torricelli, who succeeded him as professor at Florence, afterward made the shrewd guess that water rises in such a pump for the reason that the atmosphere exerts a certain pressure upon all terrestrial objects, and that when a portion of this pressure is removed from the water in the suction tube of the pump, it is the pressure of the atmosphere upon the water *external* to the pump that causes the water in the pump-tube to rise; and he saw that if that were the case, it would follow that a pump could only "draw" water up to the particular height at which the pressure due to the water-column so "drawn up" would precisely balance that of the atmosphere. The limit of 34 feet corresponds (as is easily shown by a simple calculation) to a pressure of about 15 pounds to the square inch; and hence Torricelli inferred that the atmosphere exerts a pressure of that amount upon all objects. Meditating upon this hypothesis, it occurred to him that if his explanation were indeed correct, the atmosphere would be able to raise mercury (which is about 14 times as heavy as water) to only about one fourteenth of the height to which it can raise water. He accordingly (in 1643) procured a glass tube some 35 inches long, and closed at one end. Placing it with the open end upward, he filled it with mercury. He then covered the open end to prevent the escape of the mercury, and inverted the tube so that its mouth dipped into a basin also filled with mercury. Upon uncovering the open end of the tube, he was gratified to see that the mercury in the tube at once sank until its upper surface stood at about 30 inches above that in the basin. This experiment proved that the atmosphere exerts a pressure equal to that due to a column of mercury 30 inches high; or, in other words, equal to about 14.7 pounds per square inch. Additional proofs were soon given, also. Thus Pascal suggested that if the explanation were true, the pressure ought to be less at the top of a mountain, than in a lower place; because the mountain projects up into the atmosphere so far that there is a sensibly smaller height of air above it then there is above a point in a valley. The experiment was actually carried out by M. Perrier, who carried an apparatus like Torricelli's (now known as a "barometer") to the summit of a mountain in Auvergne called the Puy de Dôme, and found at the top of this mountain (which is 4,800 feet high) the atmosphere could sustain only about 27 inches of mercury, although after returning to the plains below, the full height of 30 inches was again observed. Shortly afterward (in 1650) the air-pump was invented by Guericke, and the pressure of the atmosphere was demonstrated beyond any doubt whatever, by numerous direct experiments.

The pressure of the atmosphere varies somewhat from day to day, and even from hour to hour, as well as with the latitude and with the height above the sea. For scientific purposes the normal atmospheric pressure is now generally taken to be equal to the pressure due to a column of pure mercury 760 millimeters (29.9212 inches) high, at the level of the sea, in latitude 45°; the mercury being at the temperature 32° F. The pressure so defined is called an "atmosphere"; or, more briefly and conveniently, an "atmo." The "atmosphere" of pressure, as so defined, is nearly equal to a pressure of one million dynes per square centimeter, and it has therefore been proposed to take one million dynes per square centimeter as the standard atmosphere of pressure, calling it an "absolute atmosphere," because the dyne is a unit in the "absolute system" of units. This proposal has not yet been adopted by physicists to any great extent. See UNITS.

Knowing the pressure exerted by the atmosphere upon each square inch of the earth's surface to be about 14.7 pounds, and knowing the dimensions of the earth, it is not difficult to calculate the total weight of the entire atmosphere. The calculation, when performed, shows that the mass of the atmosphere is about 1/1,000,000th of that of the whole earth.

If the atmosphere were of uniform density, it would be easy to calculate the height to which it extends. We should only have to divide the pressure upon one square inch of the earth's surface by the weight of a cubic inch of the air, and the quotient would be the height of the

atmosphere, in inches. Thus a cubic inch of air, at a pressure of 30 inches of mercury and at the temperature of freezing water weighs about 0.000749 of an ounce; and as a column of mercury 30 inches high exerts a static pressure of about 235.8 ounces, it follows that if the atmosphere were homogeneous (that is, of uniform density throughout), its height would be about 253.8 ÷ 0.000749 = 314,000 inches, or 4.97 miles, when the air has a temperature of 32° F., and the barometric pressure is 30 inches. The height so calculated is convenient for use in certain physical computations, and is called the "height of the homogeneous atmosphere." If we turn from this problem to the more difficult one of determining the *actual* height of the atmosphere, we find that no satisfactory results can be given. As we go up, the strata become rarer and rarer, for the reason that the lower layers are weighed down and compressed by those above, and at increasing heights there is less and less air above, to exert this compression. At great heights the atmosphere becomes more and more attenuated, and thins out by insensible gradations into a perfect vacuum. There is no definite boundary, immediately below which there is an atmosphere, and immediately above which there is none. Glaisher and Coxwell, in their famous balloon ascension of 5 Sept. 1862, attained an actual elevation of over 29,000 feet, and observed a barometric height of 9.5 inches (corrected); but it is certain that the atmosphere extends far higher than this. Some estimates, based on the calculated heights of shooting stars when they first become luminous, place the limit at which the atmosphere has a density sufficient to produce any observable effects, at about 200 miles; but, as has been pointed out above, all estimates of this kind are necessarily indefinite and unsatisfying. (For some of the questions raised in connection with the limits of the atmosphere, see GASES, KINETIC THEORY OF.)

The atmosphere, as might be expected from its relatively great depth, exhibits an absorption spectrum (see SPECTROSCOPE), and this varies to a certain extent from time to time. A portion of this absorption spectrum is due to the presence of water vapor, and the "rain bands" in the spectrum have been utilized to a limited extent (though not very generally) in connection with weather predictions. It is also known that the atmosphere is less transparent to the rays at the blue end of the spectrum than to those in the middle and toward the red end. The experiments of Professor S. P. Langley, on the expedition of the United States Signal Service to Mount Whitney, demonstrated that this selective absorption is so great that the sun would appear distinctly bluish, instead of white or yellowish as it does under actual conditions, if we could see it from a point outside of our own atmosphere. (See Langley, 'Researches on Solar Heat,' 1884.)

Little is yet known concerning the electrical phenomena of the atmosphere. In clear, calm weather, the atmosphere appears to be always positively electrified, with respect to the earth, and the difference in potential increases greatly during snow storms and high winds. In thunder storms it is subject to sudden and violent oscillations, as might be expected. Many theories have been proposed to account for the electrification so observed, particularly for the enormously high potentials that are in evidence during thunder storms; but none has yet met with general acceptance. It was formerly thought that the evaporation and condensation of water had much to do with it, but no experimental evidence has been adduced to justify this hypothesis, although physicists have given it the most careful attention. Bartoli and Pettinelli made exhaustive experiments in connection with it, both with water and with organic compounds; but always without obtaining any favorable results. Kelvin, MacLean, and Gall observed electrification when dry air bubbled through a liquid, the air being electrified negatively in the case of pure water, and positively in the case of sulphuric acid or salt water. Apparently these are all friction phenomena, and it is not certain that they have any bearing on the electrical phenomena of the atmosphere. We know, from numerous experiments, that dust facilitates the condensation of aqueous vapor, and numerous authorities have endeavored to trace a similar connection between dust and the development of high electric potentials in the atmosphere. No certain results have been attained, however, as may be judged from the fact that in the 12 years immediately preceding 1902, no less than 25 new thunder-storm theories were proposed, 6 of these being published during the year 1895. See also METEOROLOGY; WIND.

Atmospheric Engine, an early form of pumping engine, invented by Papin in 1695 and subsequently improved by Newcomen and Watt. The steam cylinder is vertical and single acting, the piston being alternately forced upward by steam, and downward by the pressure of the atmosphere. See STEAM AND STEAM ENGINE.

Atmospheric Line. See INDICATOR.

Atmospheric Railway, a railway in which the propulsive force designed to move the carriages along is that of the atmosphere. The notion of such a method of locomotion seems first to have suggested itself, in the latter part of the 17th century, to the French physician Papin, whose name is forever associated with the celebrated digester. In 1810, Mr. Medhurst published a work entitled 'A New Method of Conveying Letters and Goods by Air.' His proposal was to construct a close tunnel, in which the carriages,— the last of them provided with a piston fitting the tunnel,— should be propelled by air forced in behind them. Vallance, of Brighton, in 1825, recommended, as an improvement on this plan, the exhaustion of the air in front. About 1835, Henry Pinkus, an American, residing in England, patented a scheme for placing the carriages in the open air, but connecting them below with a small tunnel, having a narrow slit above, with ingeniously constructed apparatus to render the tunnel temporarily air-tight, notwithstanding the slit. Not much was done to carry out the patent; and Pinkus' scheme of what he called a pneumatic railway was considered as having failed, when, in 1840, Messrs. Clegg and Samuda brought forward a somewhat similar project under the name of the "Atmospheric Railway." An experimental fragment of line laid down near Wormwood Scrubs, just outside of London, on the Great Western line, was successful, as was

one designed for actual use from Kingstown to Dalkey, in Ireland, another between London and Croydon, and a third in South Devon; but these have been since abandoned, and all that now remains to represent this mode of propulsion is the pneumatic dispatch tube, used for transmitting parcels to short distances. See WIRE-ROPE.

Atoll, a-tŏl', the Polynesian name for coral islands of the ringed type enclosing a lagoon in the centre. They are found chiefly in the Pacific in archipelagos, and occasionally are of large size. Suadiva Atoll is 44 miles by 34, and Rimsky 54 by 20. See CORAL ISLANDS.

Atomic'ity. See VALENCY.

Atomic Theory, in chemistry, the theory whose fundamental doctrine is that all matter is composed of ultramicroscopic particles, separated by spaces either entirely destitute of matter, or at least containing it in a very attenuated state. Such a theory was taught by Lucretius and other ancient philosophers, but the views of these early writers were necessarily vague and indefinite, and the atomic theory, as held by chemists of to-day, is generally attributed to the English scientist, John Dalton. In the early part of the 19th century Dalton called attention to the fact that when substances combine chemically they do so in certain definite proportions. His reasoning was something like this: In 100 pounds of carbon monoxid there are 42.9 pounds of carbon, and 57.1 pounds of oxygen. In the same weight of carbon dioxid there are 27.3 pounds of carbon, and 72.7 pounds of oxygen. These are merely experimental facts, obtainable by direct analysis, and they involve no hypothesis whatever. No particular relations are discernible among the numbers stated above; but Dalton discovered that if the same facts are stated in a different way, a very remarkable relation appears. Thus, suppose we calculate what weight of oxygen is combined *with each pound of carbon* in the two gases. In carbon monoxid we find that there are $57.1 \div 42.9 = 1.33$ pounds of oxygen to each pound of carbon, and in carbon dioxid we find that there are $72.7 \div 27.3 = 2.66$ pounds to each pound of carbon. One of these numbers being exactly twice the other, we conclude that carbon can unite with oxygen in two proportions, the quantity of oxygen, per unit weight of carbon, being twice as great in one case as in the other. Dalton observed similar relations among other compounds,—in fact, his theory first occurred to him while he was studying the simpler compounds of carbon and hydrogen; and after turning the matter over in his mind he came to the conclusion that the facts can best be explained by assuming that matter consists of exceedingly minute, indivisible particles or atoms, each of which has a definite weight. When two bodies combine chemically, he conceived their atoms to come together in pairs, or in threes, or fours, according to the compound formed; and he devised symbols to represent the various elementary bodies and their compounds. Thus oxygen was represented by a circle with a white centre, hydrogen by a circle with a dot in the centre, nitrogen by a circle crossed by a vertical straight line, and carbon by a solid black circle. His notation has no advantages over the one now in common use, and hence, in what follows, we shall adopt the modern symbols. As water was the only compound of oxygen and hydrogen that Dalton knew, he naturally represented it by the symbol OH, considering that in it the particles of oxygen and hydrogen are united in *pairs*. Taking the hydrogen atom as the unit, it follows that the weight of the oxygen atom must be 8, if Dalton's view of the composition of water is correct; for experiment shows that in a given mass of water there is eight times as much oxygen, by weight, as there is hydrogen. Carbon monoxid was represented by the symbol OC, and since for each unit of its oxygen (by weight) this gas contains ¾ of a unit of carbon, it follows that the atomic weight of carbon is ¾ of that of oxygen. Hence the weight of the carbon atom is 6, the weight of the hydrogen atom being arbitrarily taken, as before, as 1. Carbon dioxid was represented by the symbol OCO. Ammonia gas, being the only compound of hydrogen and nitrogen known to Dalton, was represented by the simple symbol NH; and since experiment shows that ammonia gas contains (by weight) 4⅔ times as much nitrogen as hydrogen, the atomic weight of nitrogen must be 4⅔, or 4.67. In presenting the foregoing sketch of Dalton's views, use has been made of better experimental data than were available in his time, in order that the relation of his system of atomic weights to the modern system may be more clearly seen. A few of his actual determinations of atomic weights, from the imperfect data that he had, are given in the accompanying table. These were published in

Element	Atomic Weight
Hydrogen	1.0
Nitrogen	4.2
Carbon	4.3
Phosphorus	7.2
Oxygen	5.5

1805, and his general theory of chemical compounds was given in the first volume of his 'New System of Chemical Philosophy,' published in 1808. All subsequent researches have tended to confirm Dalton's fundamental conception, that matter is discontinuous in its ultimate nature, and consists of discrete atoms which come together in definite groups when chemical combination occurs. And we agree with him, to-day, in the belief that the so-called "atomic weights" of substances are really the *true relative weights of their atoms;* the weight of the hydrogen atom being taken as unity. Soon after Dalton's theory had been announced, it was observed that there are simple *volumetric* relations among *gases* when they combine. Thus it was noticed that 2 volumes of hydrogen combine with 1 volume of oxygen to form water; that 1 volume of hydrogen combines with 1 volume of chlorine to form 2 volumes of hydrochloric acid gas; and so on. This being the fact, it was suggested by Avogadro in 1811, and independently by Ampère in 1813, that all gases, when under the same conditions of temperature and pressure, contain the same number of constituent particles per unit of volume. This principle, known as "Avogadro's Law," has been of the greatest service to chemistry. Its truth was long questioned, but as it has led to results of great value, and has been found to be in conformity with all other known facts of

chemistry, it is now accepted without reserve as a fundamental principle of nature. Moreover, the kinetic theory of gases has shown that it is a mathematical necessity, if gases are admitted to consist of elastic particles, flying about through space, and colliding with one another, and with the walls of their containing vessels. (See GASES, KINETIC THEORY OF.) But if Avogadro's law be admitted to be a fact of nature, it becomes necessary, at once, to make an important modification in Dalton's theory. For it is plain that if 1 cubic inch of hydrogen, containing (say) n atoms, combines with 1 cubic inch of chlorine, also containing n atoms, to produce 2 cubic inches of hydrochloric acid gas, containing n constituent particles altogether, then the number of such particles *in each cubic inch* of the hydrochloric acid gas is only $n \div 2$; whereas Avogadro's law requires us to admit the existence of n particles *per cubic inch*, in the compound gas as well as in each of its constituents. It follows, therefore, that when the H and the Cl combine, their ultimate particles do not simply unite in pairs. There is no way to explain the observed facts, consistently with Avogadro's law, unless we assume that the ultimate particles of H and Cl are both compound, and that when these gases combine, their particles split in two, half a particle of the one combining with half a particle of the other, to produce a whole particle of HCl. In other words, Avogadro's law compels us to admit that the little corpuscles of which matter is composed, and which we have heretofore called atoms, are really (in some cases, at least) systems composed of still smaller bodies. To distinguish between the two kinds of particles — namely, between the systems and their component bodies — it therefore becomes necessary to introduce a new term. The systems are called «molecules» (literally, «tiny masses»), and their constituent parts are still called «atoms.» To put the case in another way, the smallest parts into which a given substance can be conceived to be divided, without changing its chemical character, are called «molecules»; while the word «atom» is reserved for the smallest portion of a substance that can enter into a chemical combination. A molecule is a system of atoms capable of independent existence; and an atom is one of the parts into which the molecule of a substance divides, as a preliminary to entering into a chemical combination.

We have but little information, up to the present time, concerning the number of atoms entering into the molecules of the different elements. The molecules of cadmium, mercury, zinc, and indium are believed to be monatomic, at least when those bodies are in the gaseous state; so that in these cases there is no difference between a molecule and an atom. The same is apparently true of the newly discovered gases, argon, helium, neon, krypton, and xenon. Hydrogen, nitrogen, oxygen, selenium, and tellurium are believed to be diatomic; that is, their molecules are believed to contain two atoms each. Phosphorus and arsenic are believed to be tetratomic, their molecules containing four atoms each. Chlorine, bromine, and iodine are diatomic at temperatures below 1100° F., but above 1100° their molecules are believed (by some authorities) to break up into single atoms, so that at about 2200° F. two thirds of the little particles present in these substances are free atoms, while the remaining one third continue to exist as diatomic molecules. Sulphur is hexatomic at 900° F., but its molecules break up somewhat at higher temperatures, and are practically all diatomic above 1500°. According to this view of the case, if H stands for the atom of hydrogen and Cl for the atom of chlorine, what happens when a molecule of one of these gases combines with a molecule of the other is not simply $H + Cl = HCl$, because the molecule of hydrogen must be represented by H_2 and that of chlorine by Cl_2. Hence the process of combination consists of two parts, the first of which is

H_2	+	Cl_2	=	$H + H$	+	$Cl + Cl$
Molecule of hydrogen		Molecule of chlorine		Atoms of hydrogen		Atoms of chlorine

The atoms of hydrogen and chlorine, thus set free, then combine to form hydrochloric acid, in the following manner:

$$H + H + Cl + Cl = HCl + HCl;$$

or we may write the whole operation in the following simple manner:

$$H_2 + Cl_2 = 2HCl.$$

Dalton, assuming that the formula of ammonia is NH, and knowing by experiment that the weight of the nitrogen present is 4.67 times as great as the weight of the hydrogen, would conclude that the atomic weight of nitrogen is 4.67; but since experiment shows that when ammonia gas is separated into its constituent elements, 2 volumes of the ammonia yield 1 volume of nitrogen and 3 volumes of hydrogen, Avogadro's law requires us to conclude that the true formula for ammonia is NH_3; and hence we must take $3 \times 4.67 = 14$ as the atomic weight of nitrogen. This example will suffice to show how Avogadro's law obliged chemists to modify the atomic weights that would be obtained by the methods known to Dalton. Direct analysis of compounds of an element whose atomic weight is desired will give either that atomic weight itself, or some simple multiple or submultiple of it; but to decide between these several multiples (as for example between 4.67 and 14, in the case cited above), it is necessary to have recourse to Avogadro's law, or to some other equally general principle. Unfortunately Avogadro's law cannot always be applied to the determination of atomic weights, because it frequently happens that no compound of the element under examination can be obtained in the gaseous condition, or that the gaseous compounds that can be obtained are unsatisfactory, for one reason or another, and not adapted to the determination of the particular multiple that should be selected as the atomic weight of the element. In such cases recourse may be had to the law of Dulong and Petit, or to the «periodic law» of Meyer and Mendeléeff. In 1819 two distinguished French physicists, MM. Dulong and Petit, announced that the specific heats of 13 elements upon which they had made careful experiments are inversely proportional to the respective atomic weights of those elements. In other words, that the product of the specific heat and the atomic weight (which product is called the «atomic heat») is the same for all of them. This remarkable generalization did not meet with universal and immediate acceptance, because it failed in numerous cases unless the

atomic weights of the corresponding elements were changed somewhat from the values that had been previously assigned to them from purely chemical considerations. Thus in the case of bismuth, platinum, silver, and cobalt, Dulong and Petit substituted multiples or submultiples of the atomic weights then in use; and other changes were also made. Moreover, the law could not possibly be exact, because the specific heats of bodies are not constant, but vary with the temperature, and sometimes to a considerable extent. Subsequent experimenters have paid great attention to Dulong and Petit's law, however, and now that the atomic weights of the more familiar elements have been pretty well determined in one way and another, the law is found to be surprisingly near to the truth, and most of the changes for which they contended, in connection with previously accepted atomic weights, have since been made. A list of ten elements whose specific heats have been well determined are presented in the table, to illustrate the degree of accuracy with which

Element	Atomic Weight	Specific Heat	("Atomic Product Heat")
Lithium.....	7.	0.941	6.6
Aluminum....	27.	0.214	5.8
Potassium....	39.	0.166	6.5
Copper.....	63.	0.0952	6.0
Silver.....	107.	0.0570	6.1
Antimony....	119.	0.0508	6.1
Tungsten.....	183.	0.0334	6.1
Gold.....	196.	0.0324	6.4
Bismuth.....	207.	0.0308	6.4
Uranium.....	238.	0.0277	6.6

a proposed element may be expected to conform to it. The atomic weights in the table range from 7 to 238, and yet when we multiply each one by the corresponding specific heat, we find that the product (or "atomic heat") remains constant, or nearly so. In some cases (notably for boron, silicon, and carbon), a large deviation from the law is observed; but these exceptions cannot be considered in the present place. As an example of the use of Dulong and Petit's law, the case of silver may be cited. Previous to the publication of that law, the atomic weight of silver had been taken at 215. Dulong and Petit pointed out that if this value were retained, the product of the atomic weight and the specific heat greatly exceeded the value 6, to which many of the other elements approximated. They therefore proposed to halve the then accepted atomic weight of this element, and to make (of course) a corresponding change in the formulas of all compounds of silver. Regnault confirmed their experiments, and repeated their demand that the atomic weight be halved. But Berzelius, then the greatest living authority on such matters, refused to consent to the change, on the ground that silver and sodium compounds are isomorphous (see ISOMORPHISM), and that the analogy between the formulas of their corresponding compounds would be destroyed, if the atomic weight of silver were halved, while that of sodium was left unchanged. Regnault then determined the specific heat of metallic sodium, and showed that the atomic weight of that element should also be halved, in order for it to conform to Dulong and Petit's law. Berzelius' objection thus lost its force, and the atomic weights of both silver and sodium were ultimately halved, by universal consent. The "periodic law," already referred to, cannot be adequately treated in this place (see PERIODIC LAW); but it may be said that when the known elements are arranged in the order of their atomic weights, it is found that certain attributes recur in a remarkable "periodic" manner, as we pass from one end of the array to the other. This fact is of great assistance in the determination of atomic weights, because any great error in the assignment of the atomic weight of an element would throw that element, among others with which it would have relations, entirely out of harmony with those that prevail in other parts of the array. This "periodic" classification is so powerful and far-reaching, that the existence of new and previously unsuspected elements has been predicted by it, and afterward verified (in some cases) by the actual discovery of the elements themselves. The newly discovered gas "argon" (q.v.) affords an interesting case of the determination of an atomic weight by indirect means. Argon has resisted all attempts to make it combine with other substances, and hence it has been impossible, thus far, to analyze any of its compounds. Its density was found, by direct experiment, to be about 20 times as great as that of hydrogen. Now if, as Avogadro's law states, a cubic inch of argon contains just as many molecules as a cubic inch of hydrogen (under the same conditions of temperature and pressure), then it follows that a molecule of argon weighs 20 times as much as a molecule of hydrogen, or 40 times as much as an *atom* of hydrogen. To find the weight of an atom of argon we therefore merely have to divide 40 by the number of atoms that there are in its molecule. For an explanation of the method by which the number of atoms in the molecule of such a gas is obtained, we must refer to the article GASES, KINETIC THEORY OF; it will suffice, in the present place, to state that it was found that argon is monatomic, its molecule containing but a single atom. Therefore the conclusion was, that the atomic weight of argon is about 40. The "periodic law" was not of any great service in this case, because the properties of the new gas proved to be so unlike those of any previously known substance that its proper place in the general scheme could not be even guessed until its atomic weight had been determined. The subsequent discovery of helium and the other inert gases of the same group showed, however, that the atomic weight already assigned to argon is in reasonably good accordance with the periodic law.

Chemists educated in recent years can hardly conceive the confusion that prevailed half a century ago, while the principles that have been outlined above were struggling for recognition and universal adoption. There was no agreement as to what atomic weights nor what formulas should be used. Mendeléeff says: "Some took O=8 and others O=16. Water in the first case would be HO and hydrogen peroxid HO_2, and in the second case (as is now generally accepted) water would be H_2O and hydrogen peroxid H_2O_2 or HO. Discussion and confusion were reigning. In 1860 the chemists of the whole world met at Carlsrühe for the purpose of arriving at some agreement on the subject. There was great difference of opinion,

and a conditional agreement (or compromise) was proposed and defended with the greatest acumen by the ranks of science. A conditional agreement was not arrived at, and ought not to have been; but instead of it, truth, in the form of the law of Avogadro-Gerhardt, received by means of the Congress a wider development, and soon afterward conquered all minds. Then the new so-called Gerhardt atomic weights established themselves, and in the seventies they had already become generally used. As soon as a few of the atomic weights had been determined with some little degree of precision, it became evident that they came nearer to exact integers than one would naturally expect them to, judging from the theory of probability. As early as 1815, Prout made the assumption (since known as "Prout's Hypothesis") that the true values of these atomic weights are really integral numbers; and he drew the inference that all elements are composed of hydrogen. Thus nitrogen, whose atomic weight is almost exactly 14, he believed to contain 14 times as many atoms to the molecule as hydrogen contains, and he believed the fundamental atom to be the same in each case. There is nothing about this assumption which conflicts with what has been said above about nitrogen being a *diatomic* gas; for all that Avogadro's law positively shows is that when a molecule of that gas divides, it splits into *halves,* and therefore contains an even number of atoms. In the absence of any evidence to the contrary we assume it to be simply diatomic, although we must always remember that future research may require us to admit it to be tetratomic, hexatomic, or even more complex. Prout's hypothesis has provoked a great deal of discussion, and since it was first proposed it has been attacked and defended by many distinguished chemists; and although rather in disfavor at present, we can hardly yet say that it has been finally laid to rest. One can scarcely glance at a table of atomic weights (such as that here presented) without being impressed by the manifest tendency shown by these atomic weights to approach integral values. Of course there are conspicuous exceptions — chlorine, for example — but the fact that many of the atomic weights are nearly integral demands some sort of an explanation. What that explanation may ultimately prove to be, we cannot now guess; but it is possible that it will be found in the development of the remarkable corpuscular hypothesis of Prof. J. J. Thomson. (See ELECTRON.) The atomic weight of oxygen was long thought to be precisely 16; very careful experiments then indicated that 15.96 is a closer approximation to the real fact; and it has recently been ascertained that 15.88 is a still better approximation. It is a matter of choice what element is taken as having the atomic weight unity, hydrogen having been chosen for this purpose merely because it is the lightest element known. For many purposes it would be convenient if the atomic weight of oxygen were precisely 16; but this value is now known to be incompatible with the assumption that the atomic weight of hydrogen is 1. Chemists have therefore been in the habit, in recent years, of multiplying all the atomic weights, as deduced on the hypothesis that H = 1, by a constant number, so determined as to make the atomic weight of oxygen come precisely 16. It happens that this number is 1.008, and this is therefore the atomic weight that must be assigned to hydrogen, if we are to adopt a scale on which the atomic weight of oxygen is to be precisely 16. A majority of the chemists of the world now use this modified scale, on which the atomic weight of hydrogen is taken as 1.008; and the scale so established is known as the "International" scale of atomic weights. A table of the atomic weights of the elements, both for H = 1, and for O = 16, is presented herewith.

TABLE OF ATOMIC WEIGHTS.

Element	Symbol	Atomic Weight	
		H=1.	O=16.
Aluminum	Al	26.9	27.1
Antimony	Sb	119.1	120.
Argon	A	39.6	39.9
Arsenic	As	74.4	75.
Barium	Ba	136.4	137.4
Bismuth	Bi	206.9	208.5
Boron	B	10.9	11.
Bromine	Br	79.36	79.96
Cadmium	Cd	111.6	112.4
Cæsium	Cs	132.	133.
Calcium	Ca	39.7	40.
Carbon	C	11.91	12.
Cerium	Ce	139.	140.
Chlorine	Cl	35.18	35.45
Chromium	Cr	51.7	52.1
Cobalt	Co	58.56	59.
Columbium	Cb	93.3	94.
Copper	Cu	63.1	63.6
Erbium	E	164.8	166.
Fluorin	F	18.9	19.
Gadolinium	Gd	155.	156.
Gallium	Ga	69.5	70.
Germanium	Ge	71.5	72.
Glucinum	Gl	9.03	9.1
Gold	Au	195.7	197.2
Helium	He	4.	4.
Hydrogen	H	1.	1.008
Indium	In	113.1	114.
Iodine	I	125.9	126.85
Iridium	Ir	191.5	193.
Iron	Fe	55.6	56.
Krypton	Kr	81.2	81.8
Lanthanum	La	137.	138.
Lead	Pb	205.35	206.9
Lithium	Li	6.98	7.03
Magnesium	Mg	24.18	24.36
Manganese	Mn	54.6	55.
Mercury	Hg	198.8	200.3
Molybdenum	Mo	95.3	96.
Neodymium	Nd	142.5	143.6
Neon	Ne	19.9	20.
Nickel	Ni	58.3	58.7
Nitrogen	N	13.93	14.01
Osmium	Os	189.6	191.
Oxygen	O	15.88	16.
Palladium	Pd	105.2	106.
Phosphorus	P	30.77	31.
Platinum	Pt	193.3	194.8
Potassium	K	38.86	39.15
Praseodymium	Pr	139.4	140.5
Rhodium	Rh	102.2	103.
Rubidium	Rb	84.76	85.4
Ruthenium	Ru	100.9	101.7
Samarium	Sa	148.9	150.
Scandium	Sc	43.8	44.1
Selenium	Se	78.5	79.1
Silicon	Si	28.2	28.4
Silver	Ag	107.12	107.93
Sodium	Na	22.88	23.05
Strontium	Sr	86.94	87.6
Sulphur	S	31.83	32.06
Tantalum	Ta	181.6	183.
Tellurium	Te	126.	127.
Thallium	Tl	202.6	204.1
Thorium	Th	230.8	232.5
Thulium	Tu	170.	171.
Tin	Sn	117.6	118.5
Titanium	Ti	47.7	48.1
Tungsten	W	182.6	184.
Uranium	U	237.7	239.5
Vanadium	V	50.8	51.2
Xenon	X	127.	128.
Ytterbium	Yt	172.	173.
Yttrium	Y	88.3	89.
Zinc	Zn	64.9	65.4
Zirconium	Zr	90.	90.7

The many questions that suggest themselves as to the size and physical nature of atoms belong properly to the domain of physics, and are discussed under the heading MOLECULAR THEORY. The day will doubtless come when the physicist and the chemist will find some common ground for the discussion of the nature of atoms and molecules; but at present these two sciences deal with such widely different classes of phenomena that no such common ground can be discerned. The atom and the molecule of the physicist appear to be hardly capable of possessing the properties that the chemist demands; but this difficulty may one day be overcome. See CHEMISTRY; ELECTRON; MOLECULAR THEORY; GASES, KINETIC THEORY OF; VALENCY; SPECTROSCOPE; PERIODIC LAW.

Atonement. The Atonement is the caption under which Christian theology introduces the discussion of the application of the merits of the life and death of Christ to the reconciliation of fallen man to his Creator, as well as of the acceptance thereof by the Divinity. It expresses the crowning effect of the incarnation. It is, in this sense, an attempt at an explanation of the coming of the Redeemer. In a general way it means compensation, restoration, expiation, satisfaction, ransom. It is a word made up etymologically of *at* and *one*, and suggests that two who were divided have become one again. It embraces all that the Saviour accomplished to nullify the effects of sin. The atonement is considered to have repaired the consequences of the primal transgression, all the moral consequences, say some, say most of the authorities. As to the physical outcome of the rebellion in Eden, it claims no change save, that through it, man has been enabled to bear patiently and meritoriously all the ills of existence and to wrest from what is evil a good that worketh unto satisfaction. The atonement idea is co-existent with what, in order to avoid conflict with those who think otherwise, may be called Biblical humanity; that is, the race whose chronicle is found in the pages of Scripture. It has no meaning for those who reject the inspiration of Holy Writ or for those whose beliefs are antagonistic to Christianity. With these, if there be any atonement at all, it lies in an evolution, by virtue of which man develops from worse to better and in the "process of the suns" reaches, unaided, to a deliverance and a perfection far surpassing even the dreams of Christianity. The subject is a vast one. It has many and far-reaching ramifications which are constantly in contact with every issue of soteriological study. To confine it within the limits of an encyclopedic article necessarily cramps it and scarcely makes for completeness. All that can be done is to present its general features, the basis on which it rests, and some of the opinions which deserve attention in the different stages of development incidental to its growth. The fact upon which the doctrine reposes is that narrated in Genesis iii., wherein the prevarication of the first couple is said to draw on them and posterity the curse of the Almighty, which He tempers with the promise of a Redeemer to come. This violation of God's command, while it rendered Adam and Eve criminal and placed them under a ban, was at the same time an insult outraging, as much as anything finite could, the infinite perfections. Thus a condition was brought about which consigned man to punishment and left an affront against the Creator to be, in some way or other, atoned for. In this plight the whole race was involved and became ostracized from God. All humanity was confronted by a God whose infinite justice called for an indemnity of some kind as a reparation for the indignity offered to His perfections, by a penal sentence to be endured, by the loss of innocence, by the unbridling of concupiscence and by a slavery which reduced it to the thrall of the prince of the powers of darkness. Immediately is perceived the gaping breach which the atonement had to bridge over. Could the restoration be achieved by man himself and alone, or by entire humanity? The general answer is a negative. It is clear from the attitude into which man was forced by his sin what the questions are which in this discussion call for a reply. The views entertained by theologians are not marked by very harmonious notes. There is a very great discrepancy of opinion. Like other doctrines, that of the atonement did not come into existence full grown. It was not formulated in the beginning. Hints of its nature are found in the New Testament. By Christians up to the time of the Reformation it was received from individual teachers, by whom, as by the laity, it was instinctively grasped, though scarcely expressed, and thus in many forms traversed the duration of nearly 15 centuries. Whenever, during all that period, it was treated by the fathers and doctors and other writers, there was unanimity on this one point: that the atonement was effected by the incarnate Son of God and that the satisfaction was complete and answered all the exactions of a just Deity, while it simply deluged man with a sea of spiritual blessings. Their contention, summed up, was that it was in the absolute power of God to pardon man without any atonement, without sending His Christ. In His wisdom, however, consulting not only the great wrong perpetrated against Him, but the welfare of His creatures, He decreed the incarnation of His divine Son, the second person of the Blessed Trinity. That Son incarnated was both God and man, possessing two natures in one person. This person was divine. As all acts are attributable to the personality of the individual, it followed that the acts of the God-man were divine, and so, whether proceeding from the human nature or not, they were infinite in value. It was necessary for an atonement act to have infinity, because sin, though committed by a finite agent, was in a measure infinite, since its malice was directed towards a being infinite in nature. Theologians made the distinction that sin was finite subjectively, but objectively infinite. The divinity of the person made the atonement secure on the side of the Father. Man was doubly privileged. The Redemption of Christ obtained for him, through grace which had its efficacy in the blood of the Saviour, the remission of sin, and strengthened him against his own weakness, his own passion and the wiles of the enemy from whose thraldom he had been rescued. In a word, the insult to the Father was wiped

out; man was restored to the old friendship, was endowed with the means of justification and sanctification and his feet put on a path to the vision of God, in the enjoyment of which sin becomes an impossibility and happiness is supreme. With very few exceptions this, more or less completely, was the form the atonement took in the thoughts of the large majority of teachers of the Church for a decade and half of centuries. They labored to hold up the dignity and liberality of the atonement. The Atoner was Christ, and He atoned through His sacrifice on the cross in a manner ample beyond all human reckoning. But the atonement was not a thing of Christianity only; its effects reached back to the whole past of man, for the Lamb who atoned was «slain from the foundation of the world.» They argued that the redemption was universal as to time and place and for all the generations of man. All the peoples before Christ came within its pale. No man, however incult, fell outside of the plan of redemption. Everyone everywhere could find its blessings within his reach. It wrought from alpha to omega on the race. Not the chosen people only, but the Gentiles as well participated in its benefits. It was taught in the period under reflexion that just as soon as the Redeemer was foretold to Adam and Eve the atonement began to energize in some inexplicable manner, but always with a view to the merits of Christ, who was to come in the fulness of time and pay the ransom. The concession of the Creator in granting a Redeemer who was to make plenary atonement for every man until the passing away of the race was, before the incarnation, a promissory note — if it may be allowed to use the term — a promissory note of salvation accepted and honored by the Maker, who knew that at the appointed time a priceless amount would be stored up for its redemption. The atonement idea, that is, the necessity of making amends to a Ruler whose mandates had been and were being violated, prevailed everywhere in the ancient world and was not confined to the descendants of Abraham. Sacrifices, propitiatory and expiatory, so common among the ancient idolators, are evidence sufficient. Among them was an uppermost thought that reconciliation with God or with the gods could not be brought about by individual efforts alone. The sacrifices of Israel emphasize the essence of all atonement. A victim was always called for. Something outside of the transgressor had to be offered to effect the lifting of the ban. That blood offerings, or others, were ineffective, save indirectly and by a mysterious connection with the oblation of Christ, is admitted throughout the extent of ante-Reform tradition. In the Jewish mind the concept of sacrifice in a multitude of cases connoted effusion of blood. The Hebrews were instructed that transgressions placed on the back of the victim died with the victim. This only in a measure, for it does not appear that they professed that after the death of the victim the guilt of the sacrificers was cancelled without any further act or cooperation on their part. Repentance was necessary and each had to do his utmost to share by individual action in the redeeming work of the sacrificial object. The vexed subject of imputation (q. v.) recurs frequently but cannot be touched here. The religion of the Jews was distinguished by the number and variety of its sacrifices. But atonement was ever before their eyes. Yom hakkippurim, or Day of Atonement, is another proof. It was a penitential occasion. Its austerity was rigorous. From the evening of the 9th to the evening of the 10th of the seventh month no bodily labor could be done, no food taken under penalty of death. All the ritual was carried out by the high priest, who offered sacrifices for the sins of himself, of the priesthood and of the people. For the typical meaning of these ceremonies see Heb. viii–x, and for a description of the solemnity cf. Lev. xvi. These types ceased with the advent of Christ. Mention has already been made of the gradual development of the doctrine of atonement. From the death of the Saviour it was admitted that «Jesus died, the just for the unjust, to redeem mankind from the bondage of corruption and to restore the broken connection between heaven and earth.» Different ways of looking at this fundamental axiom of Christianity in general, have suggested various explanations. The conditions of the dispute led to many questions which relate to the incarnation. The one thing the teaching Church held to was that Christ as man is the first and supreme mediator between God and man (1 Tim. ii. 5). Because as man He was a created being He is below God, but is above all creatures by reason of the plenitude of His grace and glory. As man He offered to God a satisfaction so singularly adequate that by it was destroyed «the handwriting of the decree» so adverse to us, and by it also man was endowed with all that is requisite to be in friendly association with God, by grace in the present and by glory in the future. Others, ministerially or otherwise, may co-operate in uniting God and man, but Christ is the chief and first and literally the only mediator (Billot).

The doctrine of the incarnation in its entirety illumines this subject, but of it and of other cognate subjects, such as justification and original sin, notice cannot be taken here. The atonement, as such, has not been treated specifically by early writers, and it would be difficult to put one's finger on any dogmatic decree in which it is definitely formulated. Just as from definitions here and there spread over the volume of authoritative teaching the nature of the atonement is elicited, so from the utterances of ecclesiastical writers one is able to reach a conclusion in harmony with the affirmation of tradition. The view still claiming attention bases itself on Scripture. Texts therefrom are not necessary for the present writing; they embrace the prophetic language of the Old and the literal language of the New Testament. The Apostolic Fathers, from Clement to Polycarp, are satisfied with stating the fundamental idea that «Christ died for us» and for our sakes. Irenaeus and Origen insist that a price had to be paid to Satan because Satan had gained a rightful mastery over and ownership of men, for which the only equivalent was the blood of Jesus. This view was never universal, but now and again it is brought forward, even up to the time of Peter Lombard. The Fathers and writers from Origen to Anselm wrote more systematically on nearly every

topic, but were unanimous in maintaining that the death of Christ was the sacrifice unique and par excellence and amply satisfactory. Some do, others do not, endeavor to explain whether and why this sacrifice was imperative. This is true of the Church East and West, Greek and Latin. Two ideas are prominent: the infinite value of the human acts of Christ, and the need of grace for human weakness. More stress is placed on the incarnation than on its concomitant effecting of the atonement. "The work of mediation was summed up but not exhausted in the dying. He was a priest and a sacrifice from the beginning, and is and always will be. The imitability of Christ's career was not confined to the death on the cross, but as well to the whole existence" (Newman).

Occasionally a peculiar view would startle the world, but without changing the generally accepted opinion. Anselm (1033) in his 'Cur Deus homo' vigorously opposes the view of Origen and others concerning the so-called bargain by which the Almighty, through Christ, purchased back the souls of men from the grasp of Satan. Then came the age of the Schoolmen. It has been the custom to look upon these men as triflers and hair splitters, but what Huxley says of Saint Thomas is, with modification, applicable to many of these very imperfectly known and much abused investigators: "His marvelous grasp and subtlety of intellect seem to me to be almost without a parallel" (Science and Morals). They all united in declaring that Christ by His sacrifice was the Atoner. They differ in their explanation of some points connected with the incarnation which are irrelevant here. They are broad and moderate in their views. Christ not only freed us from sin, says Aquinas, but won for us grace and glory, and it was fitting that by death He should overcome the power of death, but His death need not have been a violent one. Over the question whether the incarnation was an absolute necessity or only something congruous, they run through every note of the gamut of argument. Duns Scotus is one of the principal figures in the discussion. Among other views he maintains that a mere man conceived without sin, or a good angel, could have made satisfaction for the entire race had it pleased God to accept it. Express treatises on the atonement cannot be found. It is always treated as an adjunct of the incarnation. There have been many pious and devotional essays on this topic. Since the days of the scholastics all Catholic analysis of the atonement can be traced back to them or to the Fathers and doctors. The Reform opens with the 15th century of modern times, and those leaders only who have left an indelible impress upon their followers will receive attention. Arians, and those who reject the divinity of Christ directly or by implication, fall outside this inquiry.

An insistent tenet of the Reformers is, that Christ reconciled God to us, whereas the Tridentine Council teaches that He reconciled us to God. The Divinity by the very force of the divine perfections, Catholics hold, remained in itself unchanged. The fall affected man, that is, man by his transgression placed himself voluntarily under the ban of infinite justice and willingly subjected himself to all the consequences of his disobedience. Man alone changed. God's attitude was always the same. In one of his bulls Leo X. (1520) condemned 41 propositions of Luther, some of which in one way or another refer to the doctrine of the atonement. In the sixth session of the Council of Trent the decrees on justification, on the advent of Christ, on justification, etc., set forth a basis for views on the Atonement which are in opposition to those of Luther and others. Luther denies the supernatural character of man's original sanctity. God, according to Luther, planted in the very essence of human nature the capabilities and the acts of virtue. Hence no freedom of will. Sin is of the essence of man. Man is wholly evil. Calvin asserts that everything coming from man's corrupt nature is damnable and so can in no way co-operate in the atonement. It must all occur outside of himself. He contributes nothing. He is justified; he is reconciled to God, or God is reconciled to him through faith in the merits of Christ, whose obedience becomes man's obedience and whose righteousness becomes man's justification. In this way the Creator remits sin, reputes man just and rewards him with eternal life. Christ made satisfaction for sinners in two ways: by fulfilling the law in their place and by enduring the curse and penalty of the law. Everything in the atonement becomes vicarious. Another person is substituted for the debtor and the criminal. These doctrines are gathered from the Epistles of Saint Paul. Only the bare statement has been here presented of the doctrine of the Reformers. A review of the reasons advanced to sustain this teaching would repay the student. Those who came after Luther and Calvin and Melancthon modified in a lesser or greater degree this teaching and modified the idea of transference as atonement and demanded at least some co-operation, on the part of the sinner. Imputation soon became the great battleground of controversy. Investigation will reveal that in the Protestant churches there has been a recoil from the positive utterances of the Reformers. The disparity existing between the above and what can be gleaned from the early and modern history of the Catholic Church is undoubtedly marked. So much so that Pusey in his introductory essay to 'Essays on the Reunion of Christendom' observes: "The Lutheran and the Catholic belief are as like two different religions as any can be, wherein the belief as to the adorable Trinity and the incarnation is the same. The *whole* doctrine of the application of the merits of Christ to fallen man and the condition of man in consequence of the fall is radically different." In fact, the difference is so radical that there is no possibility of confounding one with the other. All Protestant theology from the rise of that religion is a literature which is within the reach of any one to consult, and further quotations or references are unnecessary. "Just as the justice of man binds the judge to punish the criminal, so is some penalty exacted from man by virtue of the same attribute, which, of course, is more perfect in the divinity. It is not the spirit of vengeance which animates God. In spite of the transgression God's love remains as it was in the beginning, without diminution or alteration of any kind. The Son

of man died for all men sufficiently, for the elect efficiently. Satisfaction is required of man. But that satisfaction is amply made by man by believing, who thus becomes one with the Redeemer and shares with Him in the redemption He wrought as the Head of the Redeemed. This is enough to excite love and repentance and the striving after holiness."

Everything bracketed above, though taken from different writers, expresses the view of the Atonement as held by Protestant expounders.

In later years, both in Germany and elsewhere, the theology outside of the Catholic Church, while apparently concordant with the opinion of the necessity of man's co-operation, harks back, consciously or unconsciously, to the belief of Luther and his immediate disciples that Christ atoned fully, and so fully that the sinner need only by some interior act appropriate to himself the work already done by the Saviour. Where there is any insistence that man must of himself do something positive, in so much is that insistence at variance with the thought that in the beginning of the Reformation was spread broadcast among the adherents of the New Religion. Might there not be drawn a distinction between atonement and salvation? The atonement would mean that Christ had done all that was necessary to reconcile man with God, but there could be no salvation unless man turned to God through the path of the atonement and by individual repentance and satisfaction so comported himself as to bring by voluntary acts his life into entire harmony with the will of his Creator. No solution of the evidently complicated nature of the atonement will compel conviction which does not answer adequately the following questions: What is the relation of the Atonement to an offended God? What was His acceptance of the sacrifice? How far did that sacrifice in itself go towards bringing God and man together? Was it alone enough to liberate man so absolutely that after the death of the victim no more was expected on his part? How were the outraged excellences of the Godhead — His justice, His mercy, His love — compensated for the injury done them by sin? Did that injury really affect the divine nature? It may be advanced here that in every theory which possesses any serious claim to assent the Supreme Being remained unimpaired in the beauty of His perfection, and it was due to the infinite justice of God to demand a congruous if not a condign reparation. What part does Satan play in the plan of redemption? Has a solution been presented? Is it and will it always be an impenetrable mystery? It is a matter so significant for Christians that they have the right to expect from some form of Christianity a clear exposition based on Scripture and authoritative teaching. For Christians it means salvation, regarding which certainty is security and doubt a calamity.

Thus much for Christianity, which emphasizes the necessity of an atonement. All Christians admit Christ as the fountain head of all reconciliation of man with God. But the world is far from being entirely or even largely Christian. In the world to-day there are about 1,500,000,000 human souls, of which number only a little over 400,000,000 have received the religion of Christ. Half of these, it is computed are Catholics, the remainder are Protestants or Catholics of some kind or other, but divided from the See of Rome. The rest of the race is either Jewish or Mohammedan or belongs to some Oriental form of worship or is out and out heathen. Will Christianity assume the responsibility of stating that beyond its pale the atonement does not reach and that therefore for the pagan there is hope neither here nor hereafter? Some mention has already been made of the Jews and their manner of atonement. Their views have crystallized into the shape which their orthodox members adopt to-day and which they base upon certain books of the Old Testament, upon their Talmud and their Targum. It differs in no way materially from the teachings of Moses and the Law and the Prophets. They lived in the past as they are living now in the hope of a great Deliverer to whom every act of worship bore and bears reference. In some way or other these typical ceremonies, it is said, influenced Jehovah to make them the promise: "I will be merciful to their iniquities, and their sins I will remember no more." (Hebrews viii, 12.) The space of this article is inadequate to include even the most summary account of the atonement idea as it was understood by the nations outside of the chosen people. Research has made it admissible that everywhere there have been religious beliefs, opinions and practices pointing to the acknowledgment of a Supreme Being and judgment to come and a reward or punishment in a life beyond this. With this are apparently connected sacrifices which no matter how accompanied by fanaticism and superstition are an attestation of an homage paid to a deity, a homage of praise, or petition, or thanksgiving or of supplication for pardon — an homage which was inspired by an underlying sentiment of the need of appeasing some offended divinity. Yet it is not easy to trace this need in those religions which are so widespread in the Levant and furthest East and proclaim as fundamental Fatalism, Metempsychosis and Pantheism. The investigation of the subject of atonement as advanced by the followers of Christ, by those followers who profess that Jesus was the Son of God, that is, was Divine, among other questions inevitably suggests the question of the possibility of salvation for all individuals of the race whose creed negatives Christianity altogether. Some reply, adequate or otherwise, may be found in the dogma that "Christ died for *all* men," whence the inference is deducible that even those who never heard of the Redeemer, or the atonement, cannot but be affected by that death. How? is a large thesis. That the problem has been approached by honest and able thinkers is plain to the readers of history. In the Christian world there is no small number who deny the primal fall and hence see nothing urgent in the discussion of the atonement. The Messiah has not yet reached this earth say the Jews, Christ was not God, say the Arians, there is no God, say the Atheists, if there be He is unknowable, say the Agnostics. For all these the atonement has very slight, if any, significance. Teachers of note advance the theory, basing it on Scripture, that the first tradition of a redeemer to

come and who was to atone, was carried by the earlier peoples as they grew and scattered and populated the earth. The Jewish idea brought by the Israelites in their wanderings and captivities and assimilated by the tribes and nations among whom they dwelt, was in the lapse of time weakened or metamorphosed, or adapted to pagan beliefs and so corrupted. "The only theory which accounts for all these facts," says Rawlinson, "is that of a primeval revelation variously corrupted through the manifold and multiform deterioration of human nature, in different races and places."

P. A. Halpin,
Saint-Thomas' Rectory, New York.

Atos'sa, the daughter of Cyrus, 530 B.C. She was successively married to Cambyses, Smerdis, one of the Magi, and Darius, son of Hydaspes, the last of whom she incited to invade Greece. The word served as a poetical name given by Pope, in his 'Moral Essays,' to Sarah, Duchess of Marlborough.

Atrato, ạ-trä'tō, a river of Colombia, of note, because it has repeatedly been made to bear a part in schemes for a ship-canal across the Isthmus of Panama. Rising on the Western Cordillera at an altitude of 10,560 feet, above sea-level, it runs 305 miles northwest through low, swampy country and falls by several mouths, interrupted by bars, into the Gulf of Darien. It is navigable by steamers for fully 250 miles, being 750 to 1,000 feet wide, and 8 to 70 feet deep. A route, surveyed by the United States government in 1871, proposed to connect the Atrato and the Jurador, flowing into the Pacific, by a canal 48 miles long. At the Paris International Congress (1879), that route was, with various others, discussed and rejected in favor of De Lesseps' line from Limon to Panama. Gold-dust is found in and about the Atrato.

Atrau'li, a town of India, in the northwest provinces. It is clean, well built, and has a good trade. Pop. 14,374.

Atrebates, ạ-trĕb'ạ-tēz, or ăt're-bā'tēz, the ancient inhabitants of that part of Gallia Belgica afterward called *Artois.* A colony of them settled in Britain, in a part of Berkshire and Oxfordshire.

Atrek, ạ-trĕk', a river of Asia, forming the boundary between Persia and the Russian Transcaspian territory, and flowing into the Caspian. Its length is over 300 miles.

Atreus, ā'troos, in fabulous history, the son of Pelops and Hippodamia. He and his brother, Thyestes, murdered their half-brother, Chrysippus, from jealousy of the affection entertained for him by their father. Thereupon they fled to Eurystheus, with whose daughter, Aërope, Atreus united himself, and after the death of his father-in-law became king of Mycene. Thyestes had two sons by the wife of his brother, and was banished by Atreus. Thirsting for revenge, Thyestes conveyed away secretly a son of his brother, and instigated him to murder his own father. This design was discovered, and the youth, whom Atreus thought to be the son of his brother, was put to death. Too late did the unhappy father perceive his mistake. A horrible revenge was necessary to give him consolation. He pretended to be reconciled to Thyestes, and invited him with his two sons to a feast, and after he had caused the latter to be secretly slain he placed a dish made of their flesh before Thyestes. When the father had finished eating Atreus brought the bones of his sons and showed him the dreadful revenge which he had taken. Atreus (or his son Pleisthenes) was the father of Agamemnon and Menelaus, who are hence called the Atridæ, Atridēs (the singular) being often distinctively applied to Agamemnon.

A'treus, Treasury of, a subterranean building at Mycenæ, so styled by Pausanias and frequently referred to as "the tomb of Agamemnon." It is a vaulted tomb resembling a bee-hive in construction, its arch being composed of projecting horizontal courses of stone narrowing as the top is approached. It contains a circular chamber 50 feet wide with a smaller square one adjoining.

Atri, ä'trę, Italy, the ancient *Adria;* a town of the province of Teramo, in Italy; 14 miles southeast of the city of Teramo, on the Brindiri R.R. There are some ruins of ancient walls and buildings. The cathedral is interesting for its frescoes, and a 15th-century painting of the Madonna worshipping the child. It manufactures silk, soap, and licorice. Pop. (1901) 13,448.

At'riplex, a large genus of succulent plants of the natural order *Chenopodiaceæ,* widely distributed in tropical and temperate climates. Many of the species are weeds, but some, known as saltbush (for example, *A. leptocarpa* and *A. semibaccata*) are used as forage plants in Australia, where they are native upon the alkali soils. They have also proved promising in the alkali soils of the western United States. (Consult Circular 3, Division of Agrostology, United States Department of Agriculture, Washington.) *A. hortensis,* orach (q.v.) or sea-purslane, an erect annual herb with yellowish-green or red leaves, was formerly very popular as a substitute for spinach and is still so used to some extent. A few species are also cultivated for ornament.

A'trium, the entrance hall and most important apartment in ancient Roman houses. It was usually ornamented with statues and various family relics, and in the roof there was an opening called the *compluvium,* toward which the roof sloped so as to throw the rain-water into a cistern in the floor known as the *impluvium.* In this room the nuptial couch was placed, and here the matron with the women of the household sat and spun. It was also used as a reception room for visitors and clients. In mediæval times, till the 12th century, the name was given to a cov-

ered court, somewhat on the model of the ancient atrium, constructed in front of the principal doors of an edifice. Later the cloister at the side of the church, for the use of the monks, took the place of the atrium.

At'ropa, a genus of plants of the natural order *Solanaceæ*. Its best known species is probably *A. belladonna*. See BELLADONNA.

Atrophy, a term denoting a diminution in the size of the organs, or tissues that make up the body. It is part of the physiological process in its simpler forms, as many parts of the body atrophy and become of secondary service in adult life; the thymus gland and umbilical vessels being examples. It may also be a symptom of disease, particularly in affections of the nervous system in which the trophic fibres of an organ are involved. It may also indicate a perverted state of nutrition. See NUTRITION.

At'ropine, a crystalline alkaloid obtained from the deadly nightshade. It is extremely poisonous. Large doses cause delirium, convulsions, and finally stupor and death. It is employed for several purposes in medicine, to relieve pain or spasm, and to arrest excessive sweats. The physiological action of atropine is chiefly exerted on the nervous system. It is a strong stimulant, particularly of the motor and respiratory centres, and paralyzes the end filaments of many nerves, particularly those that supply the secretory glands, the involuntary muscles, and the heart. Its chief poisonous symptoms are, in the stage of excitement, dryness of the mouth and pharynx, with anesthesia, a hot dry skin, dilatation of the pupil with blurred vision, due to paralysis, extreme restlessness, due to the motor excitation, a noisy, busy, and incoherent brain action, perhaps a delirium, quickened pulse, quickened respiration. This stage may pass into one of depression in which the patient becomes comatose, the pulse and respiration become slowed and death results from asphyxia. Treatment of the poisoning should include prompt washing of the stomach, emetics being of no service because of the anesthesia, artificial respiration, infusions of hot coffee, and general supportive measures. See BELLADONNA; SOLANACEÆ.

Atropos, ăt'rō-pŏs, the eldest of the Fates, who cuts the thread of human life with her shears.

Atsuta, ạt-soo'tạ, Japan, a town in the southern part of Honishu, practically a suburb of Nagoya, with which it is connected by rail. It contains a number of Shintoese temples, in one of which the sword forming part of the Japanese imperial regalia, is kept. Pop. (1898) 24,291.

Attaché, ạ'tạ'shạ', a military, naval or subordinate member of the diplomatic service attached to an embassy or legation. Modern usage in effect restricts the term to subordinate officers of an embassy or legation.

Attach'ment, in law, a taking of a person, goods, or estate by virtue of a writ or precept. It is distinguished from an *arrest* by proceeding out of a higher court by precept or writ, whereas the latter proceeds out of an inferior court by precept only. An arrest lies only against the body of a person, whereas an attachment lies often against the goods only, and sometimes against the body and goods. It differs from a *distress* in that an attachment does not extend to lands, while a distress cannot touch the body. In the United States attachment may be defined as the taking into the custody of the law the person or property of one already before the court, or whom it is sought to bring before the court; also a writ for this purpose. To some extent it is of the nature of a criminal process. In some States a plaintiff can at the beginning of an action to recover money attach the property of the defendant as a security for the payment of the judgment expected to be recovered; and in case of recovery the property is applied in satisfaction of the judgment. But the more usual rule is that there can be no seizure of property, except in specified cases, till the rights of the parties have been settled by judgment of the court. The exceptions are chiefly in cases where the defendant is a non-resident or a fraudulent debtor, or is attempting to conceal or remove his property. In some States, attachments are distinguished as foreign and domestic — the former issued against a non-resident having property with the jurisdiction of the State, the latter against a resident in the State; jurisdiction over the person or property being necessary for an attachment. An attachment issued under a State law not adopted by Congress, or by a rule of court, cannot be sustained in a United States court.

Attack', a term denoting the opening act of hostility by a force seeking to dislodge an enemy from its position. It is considered more advantageous to offer than to await attack, even in a defensive war. The historic forms of attack are: (1) The parallel; (2) The form in which both the wings attack and the centre is kept back; (3) The form in which the centre is pushed forward and the wings kept back; (4) The famous oblique mode, dating at least from Epaminondas, and employed by Frederick the Great, where one wing advances to engage, while the other is kept back, and occupies the attention of the enemy by pretending an attack. Napoleon preferred to mass heavy columns against an enemy's centre. The forms of attack have changed with the weapons used. In the days of the pike, heavy masses were the rule, but the use of the musket led to an extended battle front to give effect to the fire. The advent of magazine rifles, machine and rapid-fire guns, breech-loading field and horse artillery guns, smokeless powder, etc., has reduced the methods of attack to a practical science. See TACTICS.

Attain'der, the legal consequence of a sentence of death or outlawry pronounced against a person for treason or felony, the person being said to be attainted. It resulted in forfeiture of estate and "corruption of blood," rendering the party incapable of inheriting property or transmitting it to heirs; but these results now no longer follow. Formerly persons were often subjected to attainder by a special bill or act passed in Parliament. In the United States, the Federal Constitution declares that "No bill of attainder shall be passed, and no attainder of treason, in consequence of a judicial sentence, shall work corruption of blood or forfeiture except during the life of the person attainted."

Attaint', a writ at common law against a jury for a false verdict. It was abolished in England in 1825 except as to jurors guilty of embracery. See ATTAINDER.

At'tal'ea, a genus of about 20 species of mostly tall, smooth-stemmed tropical American palms with large pinnate leaves sometimes used for thatch, mats, hats, etc., and with nut fruits enclosed in a fibrous husk. *A. funifera*, the piassaba palm of the coast provinces of southern Brazil, yields a cordage of great strength and durability in sea water. Its fruits (coquilla nuts) are as large as ostrich eggs and are used like vegetable ivory (see VEGETABLE IVORY). The piassaba palm of northern Brazil is a different species. It furnishes a fibre which is exported. *A. excelsa* and *A. speciosa* furnish nuts which are burned in rubber-making to dry and color the rubber obtained from *Siphonia elastica*. *A. compta*, the pindóva or indājá palm, a handsome species with a wide-spreading crown, yields edible fruits as large as goose eggs. *A. Cohune*, indigenous to Honduras, supplies a fruit from which the oil is extracted for soap-making at home and abroad. Several species are cultivated in greenhouses, but are generally considered too slow of growth from seed to be satisfactory.

At'talus, the names of three kings of ancient Pergamus, 241–133 B.C., the last of whom bequeathed his kingdom to the Romans. All were munificent patrons of art and literature.

At'talus, Flavius Priscus, the emperor of the East for one year, 409–10. He was proclaimed by Alaric and his Goths, but soon deposed. Honorius later cut off his thumb and forefinger and banished him to the island of Lipari.

Attâr, ät-tär', **Ferid eddin**, celebrated Persian poet: b. near Nishapur, 1119; d. about 1229 (?). The son of a spicer, he followed his father's trade (whence his surname of Attâr), but afterward became a dervish and one of the greatest mystics of Persia. He is said to have been killed by a Mongol soldier during the invasion by Jenghiz Khan. Of his extant political works the most famous are: 'The Book of Council,' a series of didactic poems on ethics; 'The Parliament of Birds' (1184–7). His principal work in prose is 'Biographies of the Saints.'

At'tar, or **Otto of Roses**, a perfume extracted from rose petals. It is a volatile oil, of soft consistency, nearly colorless, and deposits a crystallizable substance partially soluble in alcohol. The best article is prepared at Ghazipoor in Hindustan; but is apt to be much adulterated with sandal wood and other oils. The whole country, for many miles around Ghazipoor, is a garden of roses, and in the spring of the year presents a most beautiful picture of red and green. The roses are used both for rose water and the oil of roses. The latter is obtained from the rose water by setting it out during the night in large open vessels, and early in the morning skimming off the essential oil, which floats at the top. The rose water after the removal of the oil is not so highly valued as before. It is estimated that 200,000 well-grown roses are required to produce half an ounce of the oil; and the value of this when it is manufactured is about $40, and even then it is likely to be adulterated. If warranted genuine, it sells for about $50 or $100 per ounce. Attar is also imported from Smyrna and Constantinople; but it rarely, if ever, arrives in this country pure. It is commonly adulterated with spermaceti and a volatile oil, which appears to be derived from one or more species of *Andropogon*, and which is called oil of ginger-grass, or oil of geranium. Pure attar of rose, carefully distilled, is at first colorless, but speedily becomes yellowish. It congeals below 80°; melts at 84°. At 57°, 1,000 alcohol dissolve 7½ oil, and at 72°, 33 oil. Specific gravity 872. Formula, $C_{22}H_{22}O_2$. Many attempts have been made to discover some chemical reaction which would reveal the falsification of attar with geranium oil, but hitherto mostly in vain.

Attempt', in criminal law an endeavor to accomplish a crime carried beyond mere preparation, but falling short of the execution of the ultimate design in any part of it. 5 Cush. Mass. 367. To constitute an attempt, there must be an intent to commit some act which would be indictable, if done, either from its own character or that of its natural and probable consequences. In some States an attempt to commit a crime is defined by statute. The statute in New York is substantially similar to that of other States. The Penal Code of New York, § 34, provides that «An act, done with intent to commit a crime, and tending but failing to effect its commission, is an attempt to commit that crime.»

Attention. See CONSCIOUSNESS.

Atterbom, ät'tèr-bōm, **Peter Daniel Amadeus**, Swedish poet: b. Asbo, East Gothland, 19 Jan. 1790; d. Upsala, 21 July 1855. Having visited Germany and Italy in 1817–19, he formed ties of friendship with Schelling and Thorwaldsen; became instructor to Crown Prince Oscar, in 1820, and professor at the university in Upsala in 1828. He was unquestionably the foremost among the lyric poets of the romantic school in Sweden. His most celebrated work is 'The Isle of Blessedness' (1823), a romantic drama in the manner of Tieck; but he also wrote 'The Flowers,' a cycle of lyrics; 'The Blue Bird,' a play; and 'Swedish Seers and Poets,' a volume of criticism.

At'terbury, Francis, celebrated English prelate: b. Middleton Keynes, England, 6 March 1662; d. Paris, 15 Feb. 1732. He distinguished himself at the university as a classical scholar, and gave proofs of an elegant taste for poetry. In 1687 he took his degree of M.A.; is thought to have assisted his pupil, Boyle, in his famous controversy with Bentley on the Epistles of Phalaris. Taking orders in 1691 he settled in London, where he became chaplain to William and Mary, preacher of Bridewell, and lecturer of St. Bride's, and soon became distinguished by the spirit and elegance of his pulpit compositions, but not without incurring opposition, on the score of their tendency and doctrine, from Hoadly and others. Soon after the accession of Queen Anne he was made dean of Carlisle, and besides his dispute with Hoadly on the subject of passive obedience, he aided in the defense of the famous Sacheverell, and wrote 'A Representation of the Present State

of Religion,' deemed too violent to be presented to the queen, although privately circulated. In 1712 he was made dean of Christ Church, and in 1713 Bishop of Rochester and dean of Westminster. The death of the queen, in 1714, put an end to his hopes of further advancement; for the new king treated him with great coolness. Atterbury not only refused to sign the loyal declaration of the bishops in the rebellion of 1715, but suspended a clergyman for lending his church for the performance of divine service to the Dutch troops brought over to act against the rebels. Not content with a constitutional opposition, he entered into a correspondence with the Pretender's party, was apprehended in August 1772, and committed to the Tower; and in the March following a bill was brought into the House of Commons for the infliction of pains and penalties. This measure met with considerable opposition in the House of Lords, and was resisted by the bishop, who maintained his innocence with his usual acuteness and dexterity. His guilt, however, has been tolerably well proved by documents since published. He was deprived of his dignities, and outlawed, and went to Paris, where he chiefly occupied himself in study, and in correspondence with men of letters. But even here, in 1725, he was actively engaged in fomenting discontent in the Highlands of Scotland. As a composer of sermons he still retains a great portion of his original reputation. His letters, also, are extremely easy and elegant; but, as a critic and a controversialist, he is deemed rather dexterous and popular than accurate and profound.

At'tic, pertaining to Attica or to Athens. Elegant; classical; poignant; characterized by keen intellect, delicate wit, sound judgment and expressive brevity; as, the Attic Muse. Attic dialect was the most refined and polished of all the dialects of ancient Greece; and in it wrote Solon, the lawgiver; Thucydides and Xenophon, the historians; Aristophanes, the comic poet; Plato and Aristotle, the philosophers, and Demosthenes, the orator. When, after the Macedonian conquest, Greek became the language of literature and diplomacy in most parts of the civilized world, the Attic came to be that dialect of the Greek tongue which was generally adopted.

Attic Order, in architecture, a low order, commonly used over a principal order, never with columns, but usually with antæ or small pilasters. It is employed to decorate the façade of a story of little height, terminating the upper part of a building; and it doubtless derives its name from its resemblance in proportional height and concealed roof to some of the buildings of Greece. In all the best examples, and especially in the remains of antiquity at Rome, the attic is decorated with a molded base and cornice; often with pilasters and figures, as in the Arch of Constantine. In modern architecture, the proportions of the attic order have never been subject to fixed rules, and their good effect is entirely dependent on the taste and feeling of the architect. Attic base: The base of a column consisting of an upper and lower torus, a scotia and fillets between them. Attic story: A term frequently applied to the upper story of a house, when the ceiling is square with the sides, to distinguish it from a garret.

At'tica, a State of ancient Greece, whose capital, Athens, was once the first city in the world. It is a peninsula, united, toward the north, with Bœotia, toward the west, in some degree, with Megaris, and extends far into the Ægean Sea at Cape Sunium (now Cape Colonna). The unfruitfulness of its soil protected it against foreign invaders, and the Athenians boasted of their ancient and unmingled race. The earliest inhabitants of Attica lived in a savage manner until the time of Cecrops, who came 1550 B.C. with a colony from Sais, at the mouth of the Nile, to Attica, and is acknowledged as their first real king. One of Cecrops' descendants founded 11 other cities, which in after-times made war upon each other. Theseus compelled these cities to unite, and to give to Cecropia, now called Athens, as the capital city of the whole country, the supreme power over the confederacy. He founded the great feast called the *panathenæa,* watched over the administration of the laws, commanded the army, divided the whole people into three classes — noblemen, husbandmen, and mechanics. He embellished and enlarged Athens, and invited foreigners to people the country. After the death of Codrus, 1068 B.C., the monarchical form of government, which had continued 487 years from the time of Cecrops, was abolished. An archon, chosen for life, possessed the regal power. After 316 years the term of office of the archons was limited to 10 years, and 70 years later to 1 year, and their number was increased to 9. A regular code of laws was now needed. The archon Draco was commissioned to draw one up; but his severity disgusted the minds of the people, and 594 B.C. Solon introduced a milder code and a better constitution. He provided that the form of government should continue democratic, and that a senate of 400 members, chosen from the people, should administer the government. Pisistratus, a man of talents, boldness, and ambition, put himself at the head of the poorer classes, and made himself master of the supreme power in Athens. His government was splendid and beneficent, but his two sons could not maintain it. Clisthenes, a friend of the people, exerted himself to prevent future abuses by some changes in the laws of Solon. He divided the people into 10 classes, and made the senate consist of 500 persons. Attica was already highly cultivated; the vintage and harvest, like all the labors of this gay people, were celebrated with dance and song, with feasts and sacrifices. Then came the splendid era of the Persian war, which elevated Athens to the summit of fame. Miltiades at Marathon, and Themistocles at Salamis, conquered the Persians by land and by sea. The freedom of Greece escaped the dangers which had threatened it; the rights of the people were enlarged; the archons and other magistrates were chosen from all classes without distinction. The period from the Persian war to the time of Alexander (500 B.C. to 336) was most remarkable for the development of the Athenian constitution. According to Böckh's 'The Public Economy of Athens,' Attica contained, together with the islands of Salamis and Helena, a territory of 847 square miles, with 500,000 inhabitants,

365,000 of whom were slaves. Cimon and Pericles (444 B.C.) introduced the highest elegance into Athens, but the latter laid the foundation for the future corruption of manners, and for the gradual overthrow of the state. Under him began the Peloponnesian war, which ended with the conquest of Athens by the Lacedæmonians. A more dangerous enemy rose in the north — Philip of Macedon. Athens, together with the other states of Greece, became dependent on the Macedonians. When they suffered themselves to be misled to support Mithridates against the Romans, they drew upon themselves the vengeance of Rome. Sulla captured the city, and left it only an appearance of liberty, which it retained until the time of Vespasian. This emperor formally changed it into a Roman province. After the division of the Roman empire, Attica belonged to the empire of the East. 396 A.D., it was conquered by Alaric the Goth, and the country devastated. Attica, along with the ancient Bœotia, now forms a nome or province (Attike and Viotia) of the kingdom. See ATHENS.

Attica, Ind., city in Fountain County, on the Wabash River and Wabash Railroad; 21 miles southwest of Lafayette. It has numerous manufactories, churches, schools, two banks, and a public library. Pop. (1900) 3,005.

At'ticus, Titus Pomponius, a noble Roman, the intimate friend of Cicero: b. 109 B.C.; d. 32 B.C. The Pomponian family, from which he originated, was one of the most distinguished of the *equites,* and derived its origin from Numa Pompilius. When he attained maturity, the republic was disturbed by the factions of Cinna and Sulla. His brother, Sulpicius, the tribune of the people, being killed, he thought himself not safe in Rome, for which reason he removed, with his fortune, to Athens, where he devoted himself to science. His benefits to the city were so great, that he gained the affections of the people in the highest degree, and acquired so thorough a knowledge of Greek, that he could not be distinguished from a native Athenian. When quiet was restored in Rome he returned and inherited from his uncle 10,000,000 sesterces ($500,000). His sister married the brother of Cicero. Cæsar treated him with the greatest regard, though he was known as a friend of Pompey. After the death of Cæsar, he lived in friendship with Brutus, without, however, offending Antony.

At'ticus Herod'es, Tiberius Claudius, a wealthy Athenian; b. about 104 A.D.; d. about 180. He received a careful education under the most distinguished masters of the time, and specially devoted himself to the study of oratory, to excel in which seems to have been the ruling motive of his life, ultimately attaining to great celebrity as a speaker and as a teacher of rhetoric. Among his pupils were Marcus Aurelius and Lucius Verus. He was highly esteemed by the Antonines, particularly by Aurelius, and received many marks of favor, among others the archonship at Athens and the consulate at Rome. Atticus is principally celebrated, however, for the vast sums he expended on public purposes. He withdrew from Athens, and resided at his villa near Marathon, where he died about 180 A.D. None of his writings are extant.

Attila, ăt'tĭ-la (in German, *Etzel*), the son of Mundzuk, a Hun of royal descent, who followed his uncle, Roas, in 434, and shared the supreme authority with his brother, Bleda. These two leaders of the barbarians, who had settled in Scythia and Hungary, threatened the Eastern Empire, and twice compelled Theodosius II. to purchase an inglorious peace. The Huns themselves esteemed Attila, their bravest warrior and most skilful general. Their regard for his person soon amounted to superstitious reverence, and being now sole master of a warlike people, his unbounded ambition made him the terror of all nations; and he became, as he called himself, the *scourge* which God had chosen to chastise the human race. In a short time he extended his dominion over all the people of Germany and Scythia, and the eastern and western emperors paid him tribute. The Vandals, the Ostrogoths, the Gepidæ, and a part of the Franks united under his banners. Hearing a rumor of the riches and power of Persia, he directed his march thither, but was defeated on the plains of Armenia, and drew back to satisfy his desire of plunder in the dominions of the emperor of the East. He easily found a pretext for war, for all states which promised him a rich booty were his natural enemies, and all princes whom he hoped to conquer had broken alliances. The Emperor Theodosius collected an army to oppose his progress; but in three bloody battles fortune declared herself for the barbarians. Constantinople was indebted to the strength of its walls, and to the ignorance of the enemy in the art of besieging, for its preservation. Thrace, Macedonia, and Greece, all submitted to the savage robber, who destroyed 70 flourishing cities. Theodosius was at the mercy of the victor, and was obliged to purchase a peace. Attila now directed his eyes to Gaul. With an immense army he passed the Rhine, the Moselle, and the Seine, came to the Loire, and sat down under the walls of Orleans. The inhabitants of this city, encouraged by their Bishop, Agnan (Anianus), repelled the first attack of the barbarians, and the united forces of the Romans, under their general, Aetius, and of the Visigoths, under their king, Theodoric, compelled Attila to raise the siege. He retreated to Champagne, and waited for the enemy in the plains of Chalons. The two armies soon approached each other. Attila, anxious for the event of the battle, consulted the soothsayers, who assured him of a defeat. He concealed his alarm, rode through the ranks of his warriors, reminded them of their deeds, spoke of his joy at the prospect of a battle, and at the thought that their valor was to be rewarded. Inflamed by his speech, and by the presence of their leader, the Huns were impatient for battle. At length the ranks of the Romans and Goths were broken through, and Attila was already sure of the victory, when the Gothic prince, Thorismond, the son of Theodoric, poured down from the neighboring height upon the Huns. Attila, pressed on all sides, escaped with difficulty to his camp. This was perhaps the bloodiest battle which has ever been fought in Europe; for, according to contemporary historians, 106,000 dead bodies covered the field of battle. Attila caused all his camp equipage and treasures to be brought together into a heap, in

order to burn himself with them, in case he should be reduced to extremities. But the enemy were contented with collecting their forces during the night, and having paid the last honors to the dead body of King Theodoric (Dietrich), which they discovered with difficulty, they saluted his son, Thorismond, king upon the field of battle. Thus Attila escaped, but the Franks pursued him till he had passed the Rhine. He now demanded Honoria, the sister of Valentinian III., in marriage, and conquered and destroyed Aquileia, Padua, Vicenza, Verona, Bergamo, and laid waste the plains of Lombardy. The inhabitants fled to the Alps, to the Apennines, and to the small islands in the shallows (lagoons) of the Adriatic Sea, where they built Venice. The emperor had no army to oppose him; the Roman people and senate had recourse to tears and supplications. Pope Leo I. went with the Roman ambassadors to the enemy's camp and succeeded in obtaining a peace. Attila went back to Hungary. The Romans looked upon their preservation as a miracle, and the old chronicles relate that the threats of St. Peter and St. Paul had terrified Attila — a legend which the art of Raphael and Alghardi has immortalized. Not having obtained Honoria for a wife, Attila would a second time have demanded her, sword in hand, if the beautiful Ildico had not been added to his numerous wives, with whom he solemnly united himself (453). On this occasion he gave himself up to all the extravagance of debauchery; but on the other day after the marriage, the servants and warriors, impatient to salute their master, thronged into the tent; they found Ildico veiled, sitting by the cold corpse of her husband. During the night he had died of a hemorrhage. The news of his death spread sorrow and terror in the army. His body was enclosed in three coffins — the first was of gold, the second of silver, and the third of iron. The captives who had made the grave were strangled. The description that Jornandes has left us of this barbarian king reminds us of his Kalmuck-Tartar origin. He had a large head, a flat nose, broad shoulders, and a short and ill-formed body. See Thierry, 'Histoire d'Attila' (1814).

Attis. See Atys.

At'titude, an art term signifying an artistic pose or position assumed by living figures. Attitudes require a regular study, a part of which is a knowledge of anatomy. The art of exhibiting attitudes, at least in modern times, is of recent invention. At the end of the 18th century the celebrated Lady Hamilton began the practice, and imitated, with great talent, the attitudes of antique statues in many large towns of Europe, so that Sir William Hamilton could say that he possessed, in his wife, a whole collection of antiques. Her dress was a simple tunic, fastened with a ribbon tight under the breast, and a shawl. With these she imitated all the different draperies. On the continent of Europe this art was carried to much perfection by Mrs. Hendel Schutz, who exhibited attitudes, copied from the Greek, Egyptian, Italian, and German styles of art.

At'tleboro, Mass., a town of Bristol County, 30 miles southwest of Boston, and 12 miles from Providence. It has good railroad connections, contains national banks, newspaper offices, several churches, and a system of graded schools. The town is the seat of several important industries, the chief of which is the manufacture of jewelry and electro-plate. There are also manufactories of cotton, woolen, and knit goods, and of boots and shoes. Pop. (1900) 11,335. Consult Daggett, 'A Sketch of the Town of Attleborough' (1894).

Attock, ăt-tŏk', a town and fort of the Punjab, on the east bank of the Indus. Attock stands below the fort, established by the Emperor Akbar in 1581, to defend the passage of the river. The great railway bridge across the Indus here was opened in 1883. It has five arches 130 feet high, and renders continuous the railway connection between Calcutta and Peshawur (1,600 miles). The situation of Attock is important, whether in a commercial or in a military view. It is at the head of the steamboat navigation of the Indus, being 940 miles from its mouth. Taxila, where the Macedonians crossed the Indus, has been identified with Attock.

Attorney, ăt-tûr'nĭ (*attornatus,* in Latin), a person appointed to do something for and in the stead and name of another. A public attorney or attorney at law is a person qualified to appear for another before a court of law to prosecute or defend any action on behalf of his client. The term was formerly applied especially to those practising before the supreme courts of common law at Westminster, and corresponded to the term solicitor used in regard to the courts of chancery. As an attorney was almost invariably a solicitor, the two terms came to be generally regarded as synonymous. By the Judicature Act of 1873 all persons practising before the supreme courts at Westminster are now called solicitors. Attorneys or solicitors do not plead or argue in court on behalf of their clients, this being the part of the barristers or counsel: their special functions may be defined to be, to institute actions on behalf of their clients and take necessary steps for defending them, to furnish counsel with necessary materials to enable them to get up their pleadings, to practice conveyancing, to prepare legal deeds and instruments of all kinds, and generally to advise with and act for their clients in all matters connected with law. An attorney, whether private or public, may have general powers to act for another; or his power may be special, and limited to a particular act or acts. In Scotland there is no class of practitioners of the law who take the name of attorneys. A special attorney is appointed by a deed called a power or letter of attorney, and the deed by which he is appointed specifies the acts he is authorized to perform. It is a commission, to the extent of which only he can bind his principal. As far as the acts of the attorney, in the name of the principal, are authorized by his power, his acts are those of his principal. But if he goes beyond his authority, his acts will bind himself only; and he must indemnify any one to whom, without authority, he represents himself as an attorney of another, and who contracts with him, or otherwise puts confidence in him, as being such attorney.

Attorney-General, in English law, an important officer under the king, made by letters patent. His most important duties are to

exhibit informations and prosecute for the crown in matters criminal, and to file bills in the exchequer in any matter concerning the king's revenue. The attorney-general of the United States is an officer appointed by the President. He is required by statute to give his advice and opinion upon questions of law whenever required by the president; to pass upon the validity of the title to public lands purchased for the erection of public buildings by the United States; when requested, to give his opinion to the head of any executive department on any questions of law arising in his department; to conduct and argue all cases in which the United States is interested, whenever he deems it best for the interests of the United States for him to do so; to exercise general superintendence and direction over the attorneys and marshals of all the districts in the United States and the Territories as to the manner of discharging their respective duties. The attorney-general is also a member of the Cabinet, and according to the provisions of the act of Congress of 19 Jan. 1886, is the fourth in succession, after the Vice-President, to the office of President in case of a vacancy in that office. In each of the United States there is an attorney-general, or similar officer, who appears for the people, as in England he appears for the Crown. Only a few of the duties of the attorney-generals in the various States are defined by statute, consequently, so far as applicable to our altered situation, jurisprudence, and system of government, attorney-generals of the various states are clothed with the common law powers of the attorney-generals of England. The attorney-general of England had the power (1) to prosecute all actions necessary for the protection and defense of the property and revenues of the Crown; (2) by information to bring certain classes of persons accused of crimes and misdemeanors to trial; (3) by «*scire facias*» to revoke and annul grants made by the Crown improperly, or when forfeited by the grantee thereof; (4) by information, to recover money or other chattels or damages for wrongs committed on the land, or other possessions of the Crown; (5) by writ of *quo warranto,* to determine the right of him who claims or usurps any office, franchise, or liberty, and to vacate the charter, or annul the existence of a corporation for violations of its charter, or for omitting to exercise its corporate powers; (6) by writ of mandamus to compel the admission of an officer duly chosen to his office, and to compel his restoration when illegally ousted; (7) by information to chancery, to enforce trusts, and to prevent public nuisances, and the abuse of trust powers; (8) by proceedings *in rem,* to recover property to which the Crown may be entitled, by forfeiture for treason, and property for which there is no other legal owner, such as wrecks, treasure trove, etc.; (9) and in certain cases, by information in chancery, for the protection of the rights of lunatics, and others who are under the protection of the Crown.

Attor'ney at Law, an officer of a court of justice employed by a party in a cause to manage it for him. Appearance by attorney has been allowed in England from the time of the earliest records of the courts of that country. Such appearances were first allowed in France by letters patent of Philip le Bel, 1290 A.D. No one can, by consent, be the attorney of both the litigating parties in the same section or suit. The agreement of an attorney at law, within the scope of his employment, in general, binds his client (1 Salk. 86) as to amend the record, to refer a cause, not to sue out a writ of error, to strike out a *non pros,* to waive a judgment by default, etc. The principal duties of an attorney are to be true to the court and to his client, to attend to the business of his client with prudence, skill, and honesty (4 Burr. 2061, 72 Ga. 83); to keep his client informed as to the state of his business, and to keep his secrets confided to him as such, and an attorney is privileged from disclosing such secrets when called as a witness (16 N. Y. 180, 29 Vt. 701). An attorney is allowed considerable freedom of speech, and ordinarily, is not liable for the use of false, defamatory, or malicious language, provided it was material to the issues raised by the pleadings (Hastings *v.* Lusk, 22 Wend. N. Y. 410). He is liable, however, if his language is defamatory, if it can be shown that it was not relevant to the issues, and was used for the purpose of injuring the character of his adversary (1 Barn. & C. 258).

Attrac'tion, in physics, any force acting between two bodies, which tends to bring them nearer together, or to oppose their further separation. All attractions can be divided into two classes: (1) Those which act at sensible distances, such as gravity and magnetism, and (2) those which exert measureable effects only when the bodies are exceedingly close together. Cohesion and molecular forces are examples of the second class. See COHESION; ELECTRICITY; ETHER; GRAVITATION; MAGNETISM; MOLECULAR THEORY; SURFACE TENSION.

At'tribute, in philosophy, a quality or property of a substance, such as whiteness or hardness. A substance is known to us only as a congeries of attributes. In the fine arts an attribute is a symbol regularly accompanying and characterizing some personage. Thus the caduceus, purse, winged hat, and sandals are attributes of Mercury, the trampled dragon an attribute of St. George.

Attrition, a disposition of the soul which consists in sorrow for sin springing from a salutary fear of its consequences. Theologians of the Catholic Church teach that such sorrow joined to the absolution of the priest in the Sacrament of Penance is sufficient for the remission of sin, although the penitent is counselled to strive for the more perfect sorrow (contrition), which has its motive the love of God.

At'water, Lyman Hotchkiss, American theologian: b. Hampden, Ct., 23 Feb. 1813; d. Princeton, N. J., 17 Feb. 1883. He was pastor of the First Congregational Church in Fairfield, Ct., in 1835–54; in the last named year becoming professor of mental and moral philosophy at Princeton College, and, in 1869, professor of logic, metaphysics, political science, economics and ethics there. He was the author of a 'Manual of Elementary Logic' (1867).

At'water, Wilber Olin, American chemist: b. Johnsburg, N. Y., 3 May 1844. He was graduated at Wesleyan University in 1865; made a special study of chemistry in the Sheffield Scientific School of Yale and the universities of Leipsic and Berlin. He has been

successively professor of chemistry in East Tennessee University, Maine State College, and Wesleyan University. He was director of the Connecticut Agricultural Experiment Station, 1875–7, and was appointed director of the Storrs (Conn.) Experiment Station in 1887. He has been connected for several years with the United States Department of Agriculture; has published a large number of papers on chemical and allied subjects; and since 1894, has given much attention to nutrition investigations.

At'will, Edward Robert, American bishop: b. Red Hook, N. Y., 18 Jan. 1840. He was graduated from Columbus University in 1862, and General Theological Seminary, 1864. He was rector of St. Paul's Church, Burlington, Vt., 1867–80; of Trinity Parish, Toledo, O., 1881–90; and was consecrated first Protestant Episcopal bishop of West Missouri, 14 Oct. 1890.

At'wood, Charles B., American architect: b. Millbury, Mass., 18 May 1849; d. Chicago, 19 Dec. 1895. He studied at the Harvard Scientific School, and opened an office in 1872. Within three years he received prizes for designs for the San Francisco city hall, the Connecticut State capitol, the court house in Springfield, Mass., and a commission to build the Holyoke, Mass., city hall. Removing to New York in 1875, he designed residences for W. H. Vanderbilt, Elliot F. Shepard, and W. D. Sloane, and interior decorations for the houses of Mrs. Mark Hopkins in San Francisco and Gt. Barrington, Mass. In 1884 he gained the first prize for a design for the Boston Public Library, and later a prize of $5,000 for plans for a new city hall in New York city. From 1891–3 he was associated with D. H. Burnham in planning the World's Fair buildings in Chicago. The art building, peristyle, service building, and many minor features were from his designs. He was a close student of his art, and a marvelous draughtsman, using his left hand with sureness and rapidity. D. H. Burnham said of him, "He was of an honorable, charitable disposition, but like most great artists, a mere child in the practical things of life."

At'wood, George, an eminent English mathematician: b. London 1746; d. 11 July 1807. In 1874 he published 'Treatise on the Rectilinear Motion and Rotation of Bodies; with a Description of Original Experiments relative to that Subject'— a work remarkable for its perspicuity and the extensive information which it affords. About the same time he made public an 'Analysis of a Course of Lectures on the Principles of Natural Philosophy,' read at the University of Cambridge, which is not less valuable than the preceding. He published a 'Dissertation on the Construction and Properties of Arches' (1801), and several other valuable treatises relating to mathematics and mechanical science. He invented a machine still used in physical lecture-rooms, which affords great facilities for verifying the laws of falling bodies. See Atwood's Machine.

At'wood, Isaac Morgan, American educator: b. Pembroke, N. Y., 24 March 1838. He was ordained in the Universalist Church in 1861; held several pastorates; edited *The Christian Leader* (1867–73); became an associate editor of the *Universalist Leader;* and was chosen president of the Canton (N. Y.) Theological Seminary in 1879. His chief works are: 'Have We Outgrown Christianity?' (1870); 'Latest Word of Universalism' (1878); 'Manual of Revelation' (1888); 'Walks About Zion' (1881).

At'wood, Melville, Anglo-American geologist: b. 31 July 1812, Prescott Hall, England; d. Berkeley, Cal., 25 April 1898. He studied lithology, microscopy, and geology early in life, and engaged in gold and diamond mining in Brazil. In 1843 he made a discovery that greatly enhanced the value of zinc ore. After coming to the United States, in 1852, he invented the blanket system of amalgamation. He also established the value of the famous Comstock silver lode, by an assay of minerals in that region.

At'wood's Machine, an instrument devised by George Atwood, an English physicist, for illustrating the principles governing the motion of falling bodies, and described by him in a book published in 1784. It consists essentially of a light wheel or pulley, over which a thin, flexible cord passes. A mass of matter is attached to each end of the cord, and the experiment consists in observing the velocity acquired by the system at the end of a given time. The mass to be removed is evidently the sum of the two masses attached to the ends of the cord (assuming that the wheel is light enough to be disregarded); and the force tending to set the system in motion is the difference of the weights of the two masses. By making these masses nearly equal, the motion can be made slow enough to be conveniently studied. The intensity of gravity can be determined by the aid of this machine, with sufficient accuracy for class-room purposes, and it is an admirable device for illustrating the laws of uniformly accelerated motion. For a more detailed account see Gravity.

Atys, ă'tĭs, or **Attis.** (1) The favorite of Cybele, who, having broken the vow of chastity which he made to the goddess, castrated himself, as a punishment for his crime. (2) A son of Crœsus, king of Lydia — an affecting example of filial love. He was dumb, but, seeing a soldier in a battle who had raised a sword against his father, he exerted himself so much that the bands of his tongue gave way, and he cried out, "Soldier, kill not Crœsus!"

Aubanel, ō-bā-nĕl', **The'odore,** French poet, sometimes called "The Petrarch of France": b. 1829; d. 1886. He devoted his life to the restoration of the troubadour literature. His drama, 'Lou Pan don Pecat,' was successfully staged in 1878 at Montpellier.

Aube, ōb, a French department, formed out of the south of Champagne and a small portion of Burgundy; area, 2,351 square miles. The north and northwest districts are very bleak, bare of trees, and almost destitute of vegetation; the southern districts are remarkably fertile. The forests, which are extensive, furnish much fuel for the supply of Paris. The chief manufactures are worsted and hosiery. Troyes is the capital.

Auber, ō-bar′, **Daniel Francois Esprit,** celebrated French operatic composer: b. Caen, 29 Jan. 1782; d. Paris, 13 May 1871. From natural inclination he devoted himself to the study of music, in which he had the assistance of Cherubini. His first decided success was his opera 'La Neige,' produced in 1824. By this time he had associated himself with Scribe, a very skilful writer of *libretti;* and other operas now followed in quick succession, for which the words were supplied by Scribe, and the music by Auber. Some of these are still favorites, for example, 'Le Domino Noir,' 'Les Diamants de la Couronne' (Crown Diamonds), and above all, 'Fra Diavolo,' and 'La Muette de Portici' (usually known as 'Masaniello').

Aubigné, D', J. H. M. See D'Aubigné, J. H. M.

Aubigné, ō′be-nyā′, **Theodore Agrippa d',** French soldier and author: b. Saint Maury (Saintonge), 8 Feb. 1552; d. Geneva, 29 April 1630. He fought under Henry IV., king of France, who made him a gentlemen of his bedchamber; but when the king, thinking it necessary, favored the Roman Catholics more than the Protestants, Aubigné expressed his displeasure with little reserve, and lost the favor of Henry. He now retired to Geneva, where he devoted himself to literary pursuits. He wrote a valuable 'Histoire Universelle, from 1550 to 1601' (3 vols. folio), the first volume of which was ordered to be burned by the Parliament of Paris. A volume of sonnets and other poems, under the title 'Le Printemps,' also bears his name.

Aublet, ō-blā′, **Albert,** French painter: b. Paris. He studied historical painting under Gerome; won a first-class medal in the Paris Exposition of 1889, and the decoration of the Legion of Honor in 1890. His first great painting was the 'The Wash-room of the Reserves in the Cherbourg Barracks,' exhibited in the Salon of 1879, and probably his most celebrated one is the 'Meeting of Henri III. and the Duc de Guise,' shown in the Salon of 1880.

Aubrey, â′brĭ, **John,** English antiquary: b. Easton Pierse, 1626; d. 1697. He published little, but left large collections of manuscripts, which have been used by subsequent writers. He collected materials for the 'Monasticon Anglicanum', and afforded important assistance to Wood, the Oxford antiquary. His 'Miscellanies' (1696) contains a great deal of curious and interesting information, but also displays much credulity and superstition. Another work of his was published in 1719 under the title of the 'Natural History and Antiquities of the County of Surrey.' In 1898 appeared a work by him entitled 'Brief Lives Chiefly of Contemporaries,' edited by Andrew Clark.

Au′burn, Cal., a city and county-seat of Placer County, situated on the Southern P. R.R., 36 miles east of Sacramento. It was first settled in 1849 and was incorporated as a city in 1888. It is the seat of the Sierra Normal College. Gold and quartz is found in the vicinity and there are many quartz mills. The leading industries are mining, fruit-growing, and farming. Pop. (1900) 2,050.

Au′burn, Ind., city and county-seat of De Kalb County, situated on branches of the Lake Shore & M. S., and the Baltimore & O. R.R.'s, 22 miles north of Fort Wayne. It has a thriving trade in grain, live stock, etc., and its chief manufactures are furniture, carriages, automobiles, gas engines, windmills, and stoves. Auburn was first settled in 1833, became a borough in 1836 and a city in 1900. The mayor and other officials are elected biennally. Pop. (1900) 3,396.

Au′burn, Me., a city and county-seat of Androscoggin County, on the west bank of the Androscoggin River, on the line of the Maine C. and Grand Trunk R.R.'s, 34 miles north of Portland. The city is one of the most beautiful in the State. It rises westerly from the river in almost amphitheatre form, culminating in beautiful heights known as the Western Promenade. These heights are terraced by broad, handsome avenues, upon which, overlooking the city, are elegant residences with spacious and well-kept grounds. The view from the summit of these heights is one of the most striking in Maine. The beautiful Androscoggin River, with its waterfall grand and picturesque, flows through the valley below, the two thriving cities of Auburn and Lewiston on either bank, while broad and fertile fields dotted with comfortable farm homes stretch to the north and east. Taylor Pond and Lake Auburn lie to the west and are justly considered among the most beautiful lakes of Maine. The territory of the city covers an area of 65.4 square miles.

History.— Auburn is an old town and has an interesting history. Its territory is a part of a large tract of land, originally known as Bakerstown, granted by the general court of Massachusetts in 1765. It was settled as early as 1786 and Auburn was incorporated as a town in 1842, and as a city in 1869.

Industries.— Its largest single industry is the manufacture of boots and shoes, and in this branch of manufacture it is one of the foremost cities in the country. It has ten large shoe factories employing 3,325 persons. The value of their yearly product is $6,730,000, and the shoe shipments include every State in the Union, also Canada, England, Australia, South America, China, and the Philippine Islands. Its other industries include one cotton mill with 250 employees, last, box, and carriage factories, machine shops, shoe findings, dairy products, beef and packing houses, marble and foundry products, lumber, shuttles, and spools.

Banks.— There are two national banks and two savings banks located here. The capital stock of the two national banks is $350,000; surplus, $138,378. The deposits in the savings banks, $2,492,595.

Government.— The municipal government is created by charter of the State Legislature and consists of a Mayor, a Board of Aldermen, and a Board of Common Councilmen, all are elected annually by the people on the first Monday of March. One Alderman and three Common Councilmen are elected from each of the five wards into which the city is divided, while the Mayor is elected by the votes of the entire city. The administrative officers of the city are partly elected by the Board of Aldermen and Common Council in joint body known as the City Council and partly appointed by the Mayor with the confirmation of the Board of Aldermen. The police, including the chief, are

appointed by the Mayor, subject to confirmation by the Board of Aldermen. The Fire Department is under the management of a Board of Fire Commissioners consisting of three members elected by the City Council and holding office for a term of three years. The streets, sewers, and bridges, and all matters pertaining to the repair and maintenance of the same, are under the direction of a Board of Public Works of five members created by special act of the State Legislature, elected by the City Council and holding office for a term of five years. The city owns its waterworks and the same is under the management of a board of seven Water Commissioners of which the Mayor is a member ex-officio, also created by special act of the Legislature of the State. They are elected by the City Council, each holding office for a term of six years. The schools are under the control of a Superintending School Committee of ten members, two from each ward in the city. The members of the committee are elected annually by the voters of each ward and hold their office for a term of two years. The Mayor is ex-officio chairman of the board. The assessed valuation of the real and personal property in 1904 was $6,610,071: rate of taxation 20 mills; bonded debt $533,700; floating debt $56,820.

Churches and Schools.— The city has nine churches, one of them organized as early as 1807, supported by the following denominations: Baptist, Free Baptist, Universalist, Episcopal, Methodist, Congregational, and Catholic. The city has a school population of about 5,000. School accommodations are furnished absolutely free from the kindergarten to the completion of the high school course. Excellent buildings, commodious, well appointed, and equipped with modern improvements are distributed over the city sufficient for the full accommodation of all the pupils in the primary, intermediate, grammer and high school grades. At the head of the public school system stands the Edward Little High School, a noted institution having its origin in the old Lewiston Falls Academy, incorporated in 1834. In addition to the public schools there is a Catholic Parochial School of 300 scholars, supported solely by the Catholic portion of the population. There is also an excellent free public library. The city, generally speaking, is thriving and prosperous. Its population is composed largely of skilled workmen who own their own homes and are permanent residents. The streets are wide and well paved, regularly laid out, and in the residential sections adorned with beautiful shade trees. There is an excellent and extensive electric street railway, two large and centrally located hotels, a beautiful public park, a handsome and commodious set of County buildings in which are located the Supreme Court rooms and all the County offices, and the railroad facilities and connections with all parts of the country are of the best. The city is connected with the city of Lewiston (q.v.), located immediately across the river, by four large iron bridges, and the two cities are so closely related socially and in a business way, that they form practically one community and are known as the Twin Cities of Maine. Pop. (1842, at the time of its incorporation as a town), about 2,000 (1869, at the time of its incorporation as a city), 6,169; (1900) 12,951, a gain of 15 per cent. in the preceding decade, with one exception the largest percentage of gain of any city in the State.

D. J. McGillicuddy.

Au'burn, Neb., a city and county-seat of Nemaha County, situated on the Missouri P. and the Burlington & M. R. R.R.'s, 65 miles south of Omaha. It was first settled in 1861, became a borough in 1884 and a city in 1890. There are large fruit packing and canning plants and a flour mill here. Pop. (1900) 2,664.

Au'burn, N. Y., city, county-seat of Cayuga County; on Owasco River, the outlet of Owasco Lake, and on the New York Central and Lehigh Valley R.R.'s, 26 miles southwest of Syracuse. It was first settled in 1793 by Colonel John Hardenburgh, and was called Hardenburgh's Corners; in 1805 the name was changed to Auburn, and it was selected as the county-seat; in 1815 it was incorporated as a village, and in 1848 became a city. It is the seat of a session of the Federal Court. Auburn was the home of William H. Seward, of Gen. John S. Clark (Gen. Clark still lives here), the Indian archæologist, and of Theodore Cuyler. It is situated on hills commanding an extensive view to the northeast; the head of Owasco Lake is only a few miles from the city limits to the south; and the course of the outlet of the lake is very picturesque until reaching the manufacturing district. This outlet furnishes excellent water power for the numerous industries which have made Auburn prosperous. The largest establishment is a manufactory of agricultural implements which exports its goods to every part of the world; other industries of almost equal importance are tool, carpet, and shoe factories, woolen mills, cordage factories, and breweries. The city has a progressive board of trade, and six banks, two of which are national banks having a combined capital of $400,000. Auburn contains a number of fine public and private buildings, including a general hospital, costing $100,000, a municipal hospital for contagious diseases, the court-house, the United States government building, the Case Memorial Library, and the Burtis Auditorium (erected 1904–5). There are 14 public grammar schools, the public high school, and 4 Roman Catholic parish schools. Auburn is also the seat of the Auburn Theological Seminary (Presbyterian), which, with its four buildings, Welch Memorial, and Dodge Library, Morgan Hall and Williard Memorial Chapels, forms another interesting feature of the city. In 1883 the 400th anniversary of Luther's birthday was celebrated at the Seminary by the planting at Morgan Hall of a sprig of ivy from Wartburg Castle, Luther's prison home. The city government is vested in a mayor, elected every two years, and a board of aldermen of 10 members; the mayor has the power of appointing the heads of the city departments. The municipality owns and operates the waterworks. Pop. (1900) 30,345; (1905) 31,423.

Clinton S. Marsh,
Superintendent of Schools, Board of Education.

Au'burn Theological Seminary, a Presbyterian institution in Auburn, N. Y.; organized in 1820. At the close of 1905 it had 9 professors and instructors, 56 students, 30,240 volumes in the library, grounds and buildings valued at $300,000; aggregate endowment funds, $752,583; income, $63,823; benefactions, $11,456. Its graduates then numbered 1,608.

Auck'land, a province of New Zealand, forming the northern part of North Island, and with an area of 25,746 square miles. Auckland, a city and capital of the province, and formerly capital of New Zealand, is situated on the northeast coast of North Island. It has two excellent harbors, one at Waitemata and one at Manukan on the opposite side of the isthmus. The former is one of the finest in New Zealand. There are numerous wharves and two graving docks, one of which, the Calliope dock, opened in 1887, is one of the largest in the South Seas. Connected with the chief towns of the island by rail the city has a large and increasing trade. The site is fine, and there are numerous handsome public buildings, including churches, fine schools, and the Auckland Institute. Chief manufacturing interests are ship-building yards, boiler works, glass works, shoe factories, etc. There is a United States consulate here. Pop. (1901) 34,216.

Auck'land Islands, a group of islands in the Pacific Ocean to the south of New Zealand. The largest island is about 30 miles long by 15 broad, and is covered with dense vegetation. They belong to the English government, almost entirely uninhabited, and serve as a station for whaling ships.

Auction and **Auctioneer.** An auction is a public sale of property to the highest bidder. It is not material how the sale is conducted, whether by public outcry or other manner. The essential part is the selection of a purchaser from a number of bidders. Catalogues describing the property are usually printed, the terms of the sale are also usually stated in the catalogue. Auctions are generally conducted by persons licensed for that purpose. Bidders may be employed by the owner of the property, if it be done *bona fide* and to prevent a sacrifice of the property under a given price, but where the bidding is fictitious and by combination with the owner to mislead the judgment or inflame the zeal of others it would be a fraudulent and void sale. Unfair conduct on the part of the purchaser will avoid the sale. Misdescription of property sold will avoid the sale if it is material. An auctioneer cannot bid for himself; he cannot deny his principal's title; he cannot sell at private sale; he has ordinarily the power to collect the purchase price of goods sold from the buyer. The auctioneer must use ordinary care and skill in the discharge of hs duties, and like other agents he must obey the instructions he receives from the owner of property sent him for sale. An auctioneer, according to the weight of authority, who sells stolen property is liable to the owner, notwithstanding that the goods were sold by him, and the proceeds paid over to the thief without notice of the felony. An auctioneer is also liable for want of care of the goods while in his possession. The auctioneer has a lien upon the goods for the charges of the sale, and for his commission. He is the agent of the seller, and for same purposes, of the buyer.

Aucuba, â'kū-ba, a genus containing three species, of which *A. japonica* is the best known. They belong to the natural order *Cornaceæ*. The species mentioned is a dicœcious evergreen laurel-like shrub of many varieties, native of China and Japan, largely planted on lawns and in shrubberies. It withstands the dust, smoke, and gases of cities remarkably well, but is not hardy in the Northern States. The plants bear purple flowers in summer and the female ones are particularly beautiful when bearing their scarlet berries which ripen in early spring. It is easily propagated by seed, or by green wood cuttings, and succeeds in half shade where the soil is good, friable, moist, but well-drained.

Audæ'us (Syrian Udo), the founder of a religious sect called Audians, which held anthropomorphic views, and was established under the following circumstances: Audius (b. at the end of 3d century; d. 370), was a Mesopotamian, of singular purity and severity of character. He became disgusted with the Syrian clergy, and on expressing his opinion with more firmness than discretion, was excommunicated; when a considerable number of sympathizers gathered around him and constituted themselves into a church. But this sect could not long withstand the persecutions to which it was exposed, and died almost at the same time as its founder, who passed the latter part of his life in exile in Scythia, where he converted many pagans to Christianity by the force of his teachings, and the moral beauty of his ascetic life.

Aude, ōd, a maritime department in the south of France; area, 2,433 square miles. It is mainly covered by hills belonging to the Pyrenees or the Cevennes, and is traversed by a valley drained by the Aude. The loftier districts are bleak and unproductive; the others tolerably fertile, yielding good crops of grain. Its capital is Carcassonne. Pop. (1901) 311,386.

Aude, a river of France, which rises in the East Pyrenees, in the Department of Pyrénés Orientales, and after a course of nearly 130 miles, falls into the Mediterranean. It receives several affluents, of which the principal is the Orbieu.

Audebert, ōd-bār', **Jean Baptiste,** French naturalist and engraver: b. Rochefort, 1759; d. 1800. He went, at the age of 18, to Paris to learn drawing and painting, and made himself a skilful miniature painter. This occupation having awakened in him a taste for natural history, he undertook some works which laid the foundation of his fame. The first was 'Histoire Naturelle des Singes, des Makis, et des Galéopithéques' (1800), in which he shows himself an able draughtsman, engraver, and writer. Not satisfied with laying different colors on the same plate, so as to produce a kind of painting, he went farther, and, instead of water colors, used the more durable oil colors. He carried his art to still greater perfection by using gold in his impressions, the color of which he changed in different ways, in order to imitate the splendor of his patterns. Natural history was greatly benefited by his work, the splendor of which was astonishing. His 'Histoire des Colibris, des Oiseaux-Mouches, des Jacamars, et des Promerops' (1802), is esteemed the most complete work that has appeared in this department. Fifteen copies were struck off with golden letters.

Audette, â-dĕt', **Louis Arthur,** Canadian lawyer: b. Quebec, 14 Dec. 1856. He was educated at Quebec Seminary and Laval University; called to the bar in 1880; was secretary to the board of arbitrations appointed in 1893 to deter-

mine disputed matters of account between Canada and the provinces of Ontario and Quebec; and also became registrar of the exchequer court of Canada. He published 'The Practice of the Exchequer Court of Canada' (1895).

Audiffret-Pasquier, ō'dē-frā'pȧs-kyā', **Edme Armand Gaston, Duc d',** French statesman: b. Paris, 1823. He was president of the National Assembly in 1875 and was the first life-senator appointed by that body. In 1878 he was chosen to the French Academy.

Au'diom'eter, for the measurement of hearing, an instrument devised by Prof. Hughes, the English inventor of the microphone. Among its constituent parts are an induction coil, a microphone key and a telephone. The audiometer has been materially modified, and is now principally used for obtaining a balance of induction from two electric coils acting upon a third. A scale is provided to show the extent of the movement. A varying or interrupted current being passed through the two outer coils, the preponderating current will produce the most induction if the central coil is equidistant. It can always be moved to such a point that there will be no inductive effect, one counteracting the other. Thus its position measures the relative induction. A telephone is in circuit with the intermediate coil and is used to determine when its position is such that no current is induced in it.

Au'diphone, an invention to assist the hearing of partially deaf persons in whom the auditory nerve is not entirely destroyed. The instrument, made of a thin sheet of ebonite rubber or hard vulcanite, is about the size of a palm leaf fan, with a handle and strings attached to bend it into a curving form, and a small clamp for fixing the string at the handles. The audiphone is pressed by the person using it against his upper front teeth, with the convex side outward; when so placed it communicates the vibrations caused by musical sounds or articulate speech to the teeth and bones of the skull, thence to the organs of hearing. For different sounds it requires to be focussed to different degrees of convexity. A simple strip of fine glazed mill-board has been recommended by some experimenters as cheaper and equally serviceable; and birch wood veneer has been used with success for the same purpose.

Au'dit, a term denoting an examination into accounts or dealings with money or property, along with vouchers or other documents connected therewith, especially by proper officers, or persons appointed for the purpose. Also the occasion of receiving the rents from tenants on an estate.

Audition. See Ear; Hearing.

Au'ditor. An auditor is an officer of the government, whose duty it is to examine the accounts of officers who have received and disbursed public moneys by lawful authority. In practice an auditor is an officer of the court, assigned to state the items of debit and credit between the parties in a suit where accounts are in question, and exhibit the balance. They may be appointed either by courts of law or equity. They are appointed at common law in actions of account, and in many of the States in other actions, under statutory regulations. The auditor's report must state a special account, 4 Yeates, Penn. 514, giving items allowed and disallowed, 5 Vt. 70, but it is sufficient if it refer to the account, and it is their duty to report exceptions to their decisions of questions taken before them to the court, and exceptions must be taken before them, 4 Cranch, U. S. 308; 22 Bart. N. Y. 39; unless apparent on the face of the report. The report of the auditor as to facts is final in some of the States, unless impeached for fraud, misconduct, or very evident error. When the report is set aside in whole or in part, it may be referred back or may be rectified by the court, or accepted if the party in favor of whom the wrong decision is made, remits the item.

Auditory Canal. See Ear.

Auditory, or **Eighth, Nerve,** the nerve of hearing, and of the sense of position. It has its origin in two distinct portions of the ear, in reality being two distinct nerves, the *cochlear* and the *vestibular,* both of which are sensory in their function. The cochlear nerve originates in the cells of the organ of Corti in the cochlea of the ear, and is the one that carries sound impressions into the brain. The vestibular nerve has its origin in the semicircular canals and is the nerve that conveys the sense of localization of position. Both of these nerves soon join and run together in the internal meatus, where they lie in the same sheath for some distance with the seventh or facial nerve. They enter the medulla, the cochlear nerves forming the acoustic striæ on the floor of the fourth ventricle, and end about the superior olivary body and the nucleus of the trapezium. From here the fibres enter the fillet and end about the auditory centre in the brain in the second temporal convolution. Disease here causes auditory aphasia. The fibres of the vestibular branch end in the nuclei of Deiters and Bechterew in the medulla, and then further fibres pass for the most part into the cerebellum. Disease here causes cerebellar ataxia. See Ataxia; Aphasia; Equilibrium; Hearing.

Audley, a manufacturing town in Staffordshire, England. Pop. (1901) 13,700.

Audouard, ō'dowär', **Olympe,** French writer: b. 1830; d. 1890. She was married to a notary in Marseilles, but soon after divorced. She traveled in Egypt, Turkey, and Russia; and having conducted various journals in Paris since 1860, made a successful lecture tour through the United States in 1868–9. After her return she became interested in spiritism. She was an ardent advocate of woman's rights. Among her novels and books of travel may be mentioned: 'How Men Love' (1861); 'The Mysteries of the Seraglio and of the Turkish Harems' (1863); 'The Mysteries of Egypt Unveiled' (1865); 'War to Man' (1865); 'Across America' (1869–71); 'Parisian Silhouettes' (1883).

Audouin, ō'dooăn', **Jean Victor,** French naturalist: b. Paris, 1797; d. 1841. He was professor of entomology in the Paris natural history museum and was the founder and first president of the Entomological Society. He wrote much respecting the injuries done by insects to vine and silk culture.

Audran, ō-drăn', **Edmond,** French composer: b. Lyons, 1842; d. 1891. He composed several comic operas which were exceedingly

popular, among them 'La Mascotte' (1881); 'Olivette'; 'La Grand Mogul' (1884); 'Miss Helyett' (1890); 'La Ponpée.'

Audran, ō-drän', **Gerard,** French engraver: b. Lyons, 1640; d. Paris, 1703. After three years at Rome, where he acquired a high reputation by his engraving of Pope Clement IX., was recalled to France by Colbert, and appointed engraver to Louis XIV. Here he engraved the works of Lebrun, illustrating the battles of Alexander, and many paintings by Raphael, Titian, Domenichino, Poussin, and others. His nephews, Benoit (b. 1661, d. 1721) and Jean (b. 1667, d. 1756), were also engravers.

Au'drey, Saint. See Ethelreda, Saint.

Audrey, â'drĭ, a shepherdess in Shakespeare's comedy 'As You Like It.'

Auds'ley, George Ashdown, Scottish-American architect: b. Elgin, Scotland, 6 Sept. 1838. He established himself in the United States in 1892, and subsequently became prominent both as an architect and author. In collaboration with his brother, William J. A. Audsley, he was author of several works — on illuminating, decorating, Christian symbolism, etc., and, individually, published 'Keramic Art of Japan'; 'Ornamental Art of Japan'; 'The Art of Chromolithography'; 'The Practical Decorator,' etc.

Audubon, â'dŭ-bŏn, **John James Laforest,** American naturalist: b. Mandeville, La., 4 May 1780; d. 27 Jan. 1851. From 1827–38 he published a series of 1,065 colored figures of American birds in a descriptive work, 'The Birds of America,' which still holds its place as one of the most attractive and beautiful ornithologies of the world. He was a keen and sympathetic observer, rather than a trained specialist either in science or art. The full details of his life may be found in 'Audubon and His Journals,' by his granddaughter, Maria R. Audubon, with zoological and other notes by Elliott Coues (1897), and in an earlier biography by Lucy Audubon, as well as in 'The Life and Adventures of J. J. Audubon, the Naturalist,' by Robert Buchanan (1869). He was educated in France, and studied drawing for some time under the great artist, David, but in 1798 he returned to America and took possession of a farm owned by his father on the Perkiomen River, near Philadelphia. Here, in 1808, he married Lucy Bakewell, the daughter of an English neighbor; with her he moved to Kentucky and subsequently to Louisiana, meeting in both places with financial misadventures due to his inadaptability to attend properly to trade, which left him so poor that he was obliged to paint portraits and teach dancing and fencing. From his boyhood, however, in all fortunes, he had spent much time in sketching birds and studying their habits, and in 1826 he found means to take these sketches to England, where he elaborated them into the great series which made him famous and relieved his pecuniary troubles. In 1830 he returned to America to travel for new material and, in 1831, began the publication of his 'Ornithological Biography,' in five volumes. In 1842, after 12 years spent chiefly in explorations, he bought a home on the Hudson River at a spot considerably north of New York city at that time, but now within the city limits and known as Audubon Park; here his two sons, Victor Gifford and John Woodhouse Audubon, also lived with their families. In 1843 the naturalist took another long journey, going to the Missouri River region. After 1844 he devoted himself with Dr. John Bachman (q.v.) and his sons, to a new publication, 'The Quadrupeds of America.' After 1847 his health began to fail. He was buried in Trinity Cemetery, New York.

Au'dubon Societies are organizations of bird-lovers who work to educate public opinion to a proper appreciation and protection of bird-life. They have now (1903) been organized in 30 States and have 60,000 members. Thus the efforts of a few lovers of birds have developed into a widespread movement of national importance. Hundreds of thousands of circulars, explaining the economic, educational, and esthetic value of birds, were distributed. Meetings were held; classes for bird-study formed. Whenever public opinion in a State seemed ripe, a bill was introduced in the legislature and many a law-maker was surprised to discover an active interest in birds that he had never suspected. Even the department of Agriculture at Washington began to inform him of their economic value. The bird law of the American Ornithologists' Union, which forbids the killing at any time of non-gamebirds, has been adopted in all the New England States, in New York, New Jersey, Delaware, Florida, Ohio, Kentucky, Indiana, Illinois, Wisconsin, Arkansas, and Wyoming. It is probable that within 10 years birds will be protected by law practically throughout the Union. But even then the labors of the Audubon Societies will by no means end. The laws must be enforced and the public conscience kept alive until sentiment enforces them.

Auenbrugger von Auenbrug, ow'ĕn-brûg'-ĕr fŏn ow'ĕn-brûg, **Leopold,** Austrian physician: b. Gratz, 1722; d. Vienna, 1809. As early as 1754 he had discovered the method of studying internal diseases (percussion) which made him famous; but not until after seven years of experiments and verification did he publish his treatise, entitled 'Inventum Novum ex Percussione Thoracis Humani Interni Pectoris Morbos Detegendi' (1761).

Auer, ow'ĕr, **Adelheid von,** pseudonym of Charlotte von Cosel, German novelist: b. Berlin, 6 Jan. 1818. She is the author of many stories of real life, among them, 'Footprints in Sand' (1868); 'A Sister of Charity' (1870); 'In the World's Labyrinth' (1878); 'Castles in the Air' (1882).

Au'er, Alois, Ritter von Welsbach, Austrian printer: b. Wels, 1813; d. 1869. He was trained as a compositor and in his leisure moments acquired several languages, becoming a professor of Italian in the Gymnasium of Linz. From 1841 to 1868 he was at the head of the imperial printing office at Vienna. He made many typographical discoveries and published 'Die Sprachenhalle oder das Vaterunser in 608 Sprachen' (1844); and 'Das Vaterunser in 206 Sprachen' (1847).

Auerbach, ow'ĕr-baH, **Berthold,** German novelist: b. Nordstetten, Würtemberg, 28 Feb. 1812; d. Cannes, France, 8 Feb. 1882. He began to write while a student in Heidelberg, and under the pseudonym «Theobald Chauber» pro-

duced a 'Biography of Frederick the Great' (1834–6). A series of novels from the history of Judaism, under the collective title 'The Ghetto,' of which 'Spinoza' (1837) and 'Poet and Merchant' (1839) were printed in separate editions, was followed by a translation of Spinoza, with a critical biography (1841). 'Black Forest Village Stories' (1843), was received with universal favor, translated into nearly all European languages, and established his fame. To this class of tales belong also 'The Professor's Lady' (1847); 'Little Barefoot' (1856); 'Joseph in the Snow' (1860); 'Edelweiss' (1861); 'After Thirty Years' (1876). His first effort in the field of the novel, 'New Life' (1851), met with little favor; but 'On the Heights' (1865) constituted the crowning success of his literary career. It was followed by 'The Villa on the Rhine' (1868); 'Waldfried, a Family History' (1874); and 'The Head Forester' (1879).

Au'erbach, Henry: b. 1482, at a place of the same name in Bavaria, the builder of the Auerbach court and cellar at Leipsic, mentioned in Goethe's 'Faust.' The building was erected in 1530, and tradition reports that five years after Dr. Faust was seen riding out of it on a barrel of wine. This tale Goethe has made use of in his famous poem.

Au'erbach's Kel'ler. See AUERBACH, HENRY.

Auerlite, a rare North Carolina mineral, remarkably rich in thoria, named after Dr. Carl Auer von Welsbach, the inventor of the Welsbach incandescent gas mantel. It was originally described as a hydrous silico-phosphate of thorium, $ThO_2.(SiO_2.\frac{1}{3}P_2O_5)+2H_2O$. It occurs in yellowish, zircon-like crystals of resinous lustre and having a hardness of 2.5 to 3 and a specific gravity of 4.1 to 4.7.

Auerstadt, ow'ėr-stĕt, a village in Saxony, famous for the great battle which took place there 14 Oct. 1806, between the French under Davoust, and the Prussian army under Duke Charles of Brunswick, which ended in a great victory for the former. The Prussians, who numbered 48,000, left nearly half of their men dead or wounded on the ground, while the French (30,000) escaped with a loss of only 7,000. Napoleon made Davoust Duke of Auerstadt.

Augean (â'jē-an) **Co'dex** (*Codex Augiensis*), a noted Greek and Latin MS. of the Epistles of St. Paul, supposed to have been written in the 9th century, and so called from *Augia Major,* the name of a monastery at Rheinau. After passing through several hands it came, in 1718, to Dr. Bentley, who purchased it for 250 Dutch florins, and is now in the library of Trinity College, Cambridge. This MS. is written in uncial letters, and without accents; not *continua serie,* as is common with the more ancient copies, but with intervals between the words, and a dot at the end of each. The Greek text is written in capitals, the Latin in Anglo-Saxon letters; hence it is tolerably clear that it must have been written in the west of Europe, where that formation of the Latin letters, usually called *Anglo-Saxon,* was in general use between the 7th and 12th centuries.

Au'geas, in Greek legend, a king of Elis, famed for his stable, which contained 3,000 oxen and had not been cleaned for 30 years. Hercules was desired to clear the filth away in one day, and Augeas promised if he performed it to give him a tenth part of the cattle. This task Hercules is said to have executed by turning the River Alpheus, or as some say, the Peneus, through the stable, which immediately carried away the dung and filth. Augeas refused to perform his engagement. Upon this a war ensued and Hercules conquered Elis and put Augeas to death.

Au'ger-shell, a common designation of the spiral gastropod mollusks of the *Tereboidæ* family. The shells are slender and tapering, sometimes ending in a sharp point, and are usually decorated with brown, orange, and red spots or patches. More than 200 species are known, all inhabitants of tropical waters, where they occur from the shallow waters of the shore to very great depths.

Augereau, ōzh-rō', **Pierre François Charles,** Duke of Castiglione, a marshal of France: b. Paris, 1757; d. 12 June 1816. He distinguished himself in 1794 as general of brigade in the army of the Pyrenees, and in 1796 as general of division in the army of Italy. He made himself master, 16 April, of the intrenched camp of the Piedmontese at Ceva, afterward of that at Casale; threw himself on the Bridge of Lodi, and carried it with the enemy's intrenchments. 1 August he came to the assistance of Masséna; maintained during a whole day a most obstinate struggle against a superior number of troops and took the village of Castiglione, from which he derived his ducal title. In the battle of Arcole, when the French columns wavered, Augereau seized a standard, rushed upon the enemy, and gained the victory. The directory bestowed this standard on him 29 Jan. 1797. In 1799 he was chosen a member of the Council of Five Hundred, and therefore resigned his command. He then obtained from the consul Bonaparte the command of the army in Holland. Being superseded in October 1801, he remained without employment till 1803, when he was appointed to lead the army collected at Bayonne against Portugal. When this enterprise failed, he went back to Paris, and 19 May 1804, was named marshal of the empire, and grand officer of the Legion of Honor. In July of this year the king of Spain sent him the order of Charles III. He contributed to the successes which gave birth to the peace of Pressburg, and in March 1806, had possession of Wetzlar and the country around, until, in the autumn of this year, a new war called him to Prussia. Early in 1811 Napoleon gave him the command of a corps in the army of Spain. After the entrance of the allies into France, he made submission to Louis XVIII., who made him a peer. Napoleon, on his landing in 1815, declared him a traitor. Augereau, however, expressed himself in his favor, but took no active part in the new order of things. After the return of the king he took his place again in the chamber of peers.

Augier, ō-zhyā', **Guillaume Victor Emile,** (ōzh-yā'), French dramatic poet: b. Valence, 20 Sept. 1820; d. 25 Oct. 1889. 'La Ciguë,' his first piece, in two acts, after being rejected at the Théâtre Française in 1844, was accepted by the managers of the Odeon Théâtre, and there brought out. It had a run of three months, and established the popularity of the author. The

latter subsequently produced other light pieces. These, however, were thrown in the shade by 'Gabrielle,' a five-act comedy, which has been pronounced by competent critics to be Augier's most finished and best constructed work, whether as regarding lot, poetry or the delineation of character. At the solicitation of Mlle. Rachel, Augier wrote 'Diane.' In 1868 his 'Fils de Giboyer' was successful. The style of Augier is at once classic and easy, dignified and yet pictorial. He may be said to have founded a new school in French dramatic literature, and his works, partly by their originality, and partly by intrinsic merit of a kind possessed in common with other dramatic productions, have acquired very great popularity.

Aug'ite. See PYROXENE.

Augsburg, owgz'bûrg, a city of Bavaria; situated on a plain, 35 miles northwest of Munich. It was founded by the Emperor Augustus, 12 B.C. The streets are narrow but picturesque, the buildings retaining many mediæval characteristics. Among the most notable are the cathedral, arsenal, town hall and Abbey of St. Ulrich. Napoleon III. received his early education in a gymnasium of this city. It is a centre of the book trade. Augsburg has been prominent since the Middle Ages for its commercial and financial operations and was long the home of merchant princes such as the Fuggers. It was the scene of the Augsburg Diet. It was a free city till 1806, when Napoleon ceded it to Bavaria. Pop. (1900) 88,700.

Augs'burg Confession, a document adopted by the Protestants in 1530 as a declaration of faith. Charles V., on his accession to the throne of Germany (1520), found his new dominion the theatre of religious dissensions. The insurrection in Castile, and the war with France and Italy, called Charles into Spain, diverting his attention from the Lutheran schism. The Diet of Spires (1529) had issued a decree for the purpose of conciliating the Lutherans to the proposed Roman Catholic reform, and uniting them against the Sacramentarians and Anabaptists. At this juncture, Charles returned, and the German princes and estates were summoned to convene in diet at Augsburg in June. The summons was conciliatory, and called for aid against the Turks, making no reference to the religious difficulties of the kingdom, further than to promise at no distant time a speedy adjustment of them. On the 25th of the month, a confession, prepared by Melanchthon, and approved by Luther, was presented and read by Dr. Christian Bayer in the diet. This confession is said to have been prepared on the basis of the Swabach and Torgau articles, although these had been drawn up (1528–9) in the attempt to unite with the Zwinglians, and the object of the present confession was to become reconciled to the Roman Catholic reform party. A copy of the confession, in German and English, was delivered to Charles. Two days after the reading of the confession, it was delivered to the Roman Catholic theologians for a reply. The reply was read in the diet on 3 August following, and called forth from Melanchthon a defense (*Apologia Confessionis*), which was afterward enlarged and published in Latin, and then in German. The object of the Augsburg Confession was not attained, and the edict of the emperor (22 September) gave the Lutherans until the following April to bring themselves into conformity with the requirements of the Church, and required their co-operation with the throne against the Zwinglians and Anabaptists. The Augsburg confession and Melanchthon's defense were generally circulated in western Europe, and became a sort of rallying point among the reformers.

Augs'burg, League of, a league concluded at Augsburg, 9 July 1686, for the maintenance of the treaties of Münster and Nimeguen, and the truce of Ratisbon, and to resist the encroachments of France. The contracting parties were the Emperor Leopold I., the kings of Spain and Sweden, the electors of Saxony and Bavaria, and the circles of Suabia, Franconia, upper Saxony and Bavaria.

Augs'burg Seminary, an educational institution in Minneapolis, Minn., under the auspices of the Lutheran Church. It was organized in 1869 and reported in 1902: Professors, 10; students, 170; grounds and buildings valued at $50,000; income, $12,250; graduates, 374.

Au'gur, Christopher Colon, American military officer: b. New York, 10 July 1821; d. Washington city, 16 Jan. 1898. He was graduated at the United States Military Academy in 1843; became major of the 13th United States Infantry in 1861; colonel of the 12th Infantry in 1866; brigadier-general, United States army, 4 March 1869; major-general in the volunteer service in 1862; mustered out of that service in 1866; and was retired in the regular army, 16 July 1885. He commanded a division in the battle of Cedar Mountain, being severely wounded.

Au'gur, Hezekiah, American sculptor: b. New Haven, Conn., 21 Feb. 1791; d. 10 Jan. 1858. 'Jephthah and His Daughter,' in the Trumbull gallery at Yale, is the most important of his works. In addition to his skill as a sculptor, he possessed much mechanical genius, inventing among other machines one for carving wood.

Au'gurs, a celebrated college of diviners in ancient Rome, who predicted future events and determined the will of the gods from the occurrence of certain signs, connected with thunder and lightning; the flight and cries of birds; the feeding of the sacred chickens; the action of certain quadrupeds or serpents; accidents, such as spilling the salt, etc. The answers of the augurs and the signs were called auguries; bird-predictions were auspices. Nothing was undertaken without the advice of the augurs, and by the words *alio die* ("meet on another day"), they could dissolve the assembly of the people and annul decrees passed at the meeting.

August, ow'gŭst, the name of many princes of the German principalities: (1) AUGUST WILHELM, prince of Prussia, brother of Frederick the Great, and general in the Prussian army: b. Berlin, 9 Aug. 1722; d. 12 June 1758. He took an active part in the Silesian campaign, and distinguished himself at the battle of Hohenfriedberg (in June 1745), but owing to the fatal retreat of Zittau, in 1756, he incurred the displeasure of his brother, and withdrew from the army. This conflict between the two brothers led to a correspondence, which was published in 1769. (2) AUGUST EMIL LEOPOLD, duke of Saxe-Gotha and Altenburg, successor to the throne,

20 April 1804. He was twice married, and the first marriage left him issue, one daughter, who became the reigning duchess of Saxe-Coburg, and died in 1822. By the second marriage he had no children, and on his death he was succeeded on the throne by his brother, Frederick IV., with whose decease, 11 Feb. 1825, the line of Saxe-Gotha became extinct. Duke August Emil Leopold was a favorite of Napoleon, and his duchy enjoyed perfect immunity from the burdens of French invasions and French wars. He was a man of taste and considerable literary talent. (3) AUGUST FRIEDRICH WILHELM HEINRICH, prince of Prussia: b. 19 Sept. 1790; d. 19 July 1843, in Bromberg; the son of Prince August Ferdinand, the brother of Frederick the Great, who died in 1813. He was considered one of the richest men in Prussia, and left various children by morganatic marriages. He took an active part in the campaign against Napoleon in 1806, by whom he was taken prisoner, and detained in Paris until after the peace of Tilsit. On his return to Prussia in 1813, he resumed his duties in the Prussian army, fought at Dresden, Ulm, and Leipsic, distinguished himself during the campaign of 1814, on various occasions, and bore throughout his life the character of a gallant soldier and an upright man. (4) AUGUST PAUL FRIEDRICH, grand duke of Oldenburg: b. 1783; d. 27 Feb. 1853; mounted the throne 21 May 1829, under the title of grand duke, which had been conferred upon his family by the Congress of Vienna; but of which his father had never availed himself. When Oldenburg was invaded by the French, in 1811, he accompanied his father to Russia, where his younger brother (b. 1784, d. 1812) was married to the Grand Duchess Catharine. He distinguished himself in the Russian war, and in 1813 was appointed governor of Revel. His reign, after his return to Oldenburg, was marked by political and material progress. In 1830 he concluded a treaty with Prussia for the annexation of Birkenfeld to the Prussian-Hessian Zollverein, and a reciprocal treaty of navigation. In 1836 he prevailed upon Hanover and Brunswick to make satisfactory arrangements for the regulation of excise duties. In 1831 he laid the foundation for a constitution of Oldenburg, which was ratified in 1848, and which, although modified in 1852, still secures much civil and religious freedom to the people. In 1817 he married the Princess Adelaide of Anhalt-Bernburg, who died in 1820, leaving him two daughters, Frederica and Amalie; the latter, in 1830, married King Otho of Greece. In 1825 he married the sister of his first wife, Ida, who died in 1828, having borne him a son. In 1831 he married for the third time, Cecilia, youngest daughter of the former king of Sweden, Gustavus Adolphus IV., who died in 1844, leaving a son. He was succeeded by his first son, Nicholais Frederick Peter, grand duke of Oldenburg.

Au'gust, the eighth month of our year, named by the Roman Emperor Augustus after himself, being associated with several of his victories and other fortunate events. Before this it was called Sextilis or the sixth month (counting from March). July had been named for Julius Cæsar, and the Senate, to gratify Augustus, decreed that August should have equal length, taking a day from February.

Augus'ta, a title first given to his wife Livia, after the death of Augustus, according to the will of the emperor. It was afterward conferred by Claudius on Agrippina (51 A.D.), and by Nero on his wife, Poppæa, as well as her daughter (64 A.D.). Eventually it became a common title of the mother, wife, sister, or daughter of an emperor.

Augusta, ow'gŭs-tạ, **Marie Luise Katharina,** a queen of Prussia, and empress of Germany: b. 1811; d. 1890. She was the daughter of Charles Frederick, grand duke of Saxe-Weimar, and was educated at the Weimar court. In 1829 she married William, then crown prince of Prussia, afterward emperor of Germany.

Augus'ta Victoria, duchess of Schleswig-Holstein-Sonderburg-Augustenburg: b. 22 Oct. 1858. She is the daughter of the late Duke Friedrich; married Prince Friedrich Wilhelm, afterward Wilhelm II., 27 Feb. 1881, and became empress of Germany and queen of Prussia on the accession of her husband to the thrones in June 1888. In 1900 she had borne the emperor seven children, the crown prince, Friedrich Wilhelm, being born 6 May 1882.

Augus'ta, Ga., the third city of the State in population and wealth. It is the capital of Richmond County, and at the head of navigation on the Savannah River, 231 miles by water above its mouth. It is 132 miles by rail from Savannah, 171 miles east of Atlanta, and 137 miles northwest of Charleston. It lies about 150 feet above sea level, has an even temperature and dry, invigorating atmosphere very different from most riverside cities, being indeed a well-known health resort for pulmonary invalids, particularly its suburb Summerville, on the Sand Hills 400 feet above it. It is laid out in broad rectangular streets, many of them beautifully shaded, and with a good electric car service; and has several parks, of which the chief is May Park of about 11 acres. The city hall is in a park containing a granite monument to the Georgia signers of the Declaration of Independence; while on Broad Street, the principal thoroughfare of the city, is a noble monument to the Confederate dead. The cemetery and fair grounds are also suburban attractions.

Manufactures.— The power is chiefly derived from a dam across the river seven miles above the city (enlarged from a smaller one in 1875, at a cost of about $1,000,000), 150 feet wide at top, 106 at bottom, and 11 feet deep; turning a part of the river into a canal affording 14,000 horse-power, sold to industries at $5.50 per horse-power per annum, with a working day of 16 hours. Augusta is one of the chief seats of cotton manufacture in the South. Eli Whitney's cotton gin was invented on a farm on the outskirts, and the first working gin was set up in the city. In 1902 there were 13 cotton mills with offices in the city, having a capital of nearly $6,000,000, operating 329,740 spindles, and 19,360 looms, and employing some 8,000 hands. During 1899, of about $8,000,000 new capital invested in Georgia cotton manufacturing, fully a third was in Augusta. There are also four large cotton-seed oil mills, and a bleachery. Of other manufactures, the chief are of lumber and wood products, bricks and tile drain pipe from the fine clays in the vicinity, flour, and iron goods. In 1900 there were 388 manufacturing establishments, with $9,016,619 capital and 7,042 em-

ployees; paying $2,093,915 for wages and $6,244,286 for materials; and having a total output valued at $10,069,750. The increase within the past three years, however, has been very large; and it is proposed to utilize the river still more for electric power, the present manufactories practically exhausting the direct water power. The river at Augusta is about five feet deep the year round, and fair-sized passenger and freight steamers make semi-weekly trips to Savannah. Augusta is the largest inland cotton market in the South; and it has also a large shipping trade in lumber, fruit and vegetables. Its annual trade exceeds $80,000,000, its cotton receipts amounting to 200,000 bales. The water supply is derived from the Savannah River and is unlimited. The city abounds in educational and charitable institutions. Most notable among the former is the Georgia Medical College, a branch of the State University at Athens; there are also Richmond Academy, which has recently been put under the care of the State University; Saint Mary's and Sacred Heart (Roman Catholic) academies, Paine's Institute for Colored Students, and high schools for white and colored youth. There is also a public library of 10,000 volumes. There is an orphan asylum, two public hospitals (white and colored), a juvenile reformatory, and the Louise King Home. A United States arsenal, a Masonic temple, an Odd Fellows' hall, a Chamber of Commerce, and a cotton exchange are also among the notabilities. The city has three daily and several weekly newspapers. The assessed property valuation exceeds $20,000,000, and the bonded debt in 1900 was $1,752,300. There are two national and several state banks. Augusta is on the line of many railroads, among them the Central of Georgia, the Charleston & West Carolina, the South Carolina & Georgia, the Southern, etc. Its original charter was obtained in 1798, and revised 1882; the mayor is elected for three years, and a city council, consisting of 15 members, is also elected for three years, one third being elected each year. The board of education is elected by the people. All other offices are appointive by the council, save that the mayor appoints the superintendent of canal and waterworks, and of streets and drains.

Population.— In 1800, 2,215; (1840) 6,403; (1852) 10,217; (1860) 12,493; (1870) 15,389; (1880) 21,891; (1890) 33,300; (1900) 39,441. It suffers on the census returns, however, from having suburbs, North Augusta, across the river in South Carolina; Summerville, and others not counted in; and claims about 60,000 at present.

History.—Augusta was founded in 1736 by Gen. James Edward Oglethorpe (q.v.), the founder of Georgia, and named after the Princess Augusta of Saxony, who married Frederick, Prince of Wales, in that year, and became the mother of George III. All through its early period it was the chief trading station in Georgia, and a very important military post; especially notable as the seat of conferences and treaties with the southern Indians, who under the treaties of 1763 and 1773 ceded large tracts of land to the whites; the latter, however, had to occupy much of it at the same risk of Indian warfare as before. In 1778 it was made the State capital, and remained such till 1798. The building of the Georgia railroad in the middle of the 19th century was a heavy blow to its prosperity for a time, carrying trade over new routes; but its natural advantages enabled it to recover itself.

THOS. W. LOYLESS,
Editor 'The Augusta Chronicle.'

Augusta, Maine, city county-seat of Kennebec County and capital of the State; on the Kennebec River, 40 miles above its mouth, at the head of tidal navigation, and on the Maine Central R.R., 63 miles northeast of Portland. It is situated on both sides of the Kennebec, mainly on the right or west bank, and some portion of it, including much of the residential section, occupies an elevation considerably above the river, along which the principal business part of the city extends. The Augusta, Winthrop and Gardiner electric railway connects the city with neighboring places, and its water communications afford excellent facilities for travel and trade.

Public Buildings and Institutions.— The State Capitol is a handsome granite building, for which the stone was quarried from the surrounding hills. It stands on high ground overlooking a wide extent of pleasant country. Among other noteworthy buildings are those of the Maine Insane Hospital, the City Hospital, the public library, the county buildings, and the United States arsenal. The churches include those of the Congregationalists, Episcopalians, Free Baptists, Colonist Baptists, Christians, Universalists, Unitarians, Methodists, Roman Catholics, and the People's Church. The public schools include all grades from the primary to the high school. In the capitol are the State library, a notable collection of portraits of American statesmen, and, in the rotunda, an impressive array of the Civil War battle flags of Maine soldiers. In the principal park is a soldiers and sailors' monument.

Industries.— Augusta, by reason of its railroad and river facilities, is the trade centre of a large region, and the water-power furnished by the Kennebec, across which, just above the city, extends a dam nearly 1,000 feet in length, affords abundant means for manufacturing. The cotton factories here employ about 1,100 persons; shoe manufacture, 300; pulp mill, 250; lumber mill, 100; sash and blind factory, 75; and besides various smaller establishments the city has publishing houses in which some 400 persons are employed.

Banks, etc.— There are two national banks in the city, with a combined capital of $350,000, a trust company having a capital of $100,000, and two savings banks. The deposits of these institutions aggregate $11,000,000.

Municipal Government.— The city is governed by a mayor and a city council, a body consisting of boards of aldermen and common council, elected by the people.

History.—Augusta was first permanently settled in 1754 by colonists from Massachusetts; was incorporated under the name of Hallowell in 1771; and upon the setting off of Hallowell in 1797 became a separate town. In 1831 it became the capital of the State, and has been the scene of many important political events. It received a city charter in 1849. Its population in 1900 was 11,683; in 1903 it was estimated at 12,031. The employees of the cotton factories

are mostly French Canadians, the other inhabitants chiefly natives. Consult: North, 'History of Augusta' (1870). FRED'K W. PLAISTED, *Editor 'The New Age.'*

Augus'ta, the name of many ancient European towns, as Augusta Trevirorum, now *Treves;* Augusta Taurinorum, now *Turin;* Augusta Vindelicorum, now *Augsburg,* etc.

Augus'ta, a city of Sicily. See AGOSTA.

Augus'ta Histo'ria, a series of Roman biographies of the emperors from the accession of Hadrian to the death of Carinus, the predecessor of Diocletian, a period covering 167 years. The writers included in this collection are six in number, namely, Ælius Spartianus, Julius Capitolinus, Ælius Lampridius, Vulcatius Gallicanus, Trebellius Pollio, and Flavius Vopiscus.

Augus'tan Age, the Latin literary epoch of the reign of the emperor Augustus Cæsar. During this period Horace, Ovid, Virgil, Tibullus, and other writers flourished; also great patrons of literature like Mæcenas. The poets of the Augustan Age are noted for their pure Latinity. The name is applied in England to the reign of Queen Anne (1702–14). By far the foremost name is that of Sir Isaac Newton, and of commanders, John Churchill (Duke of Marlborough). The poets were Congreve, Garth, Gay, Parnell, Philips, Pope, Prior, Rowe, and Swift. The other authors were Addison, Barnes, George Bull, Anthony Collins, Jeremy Collier, Roger Cotes, Defoe, Dodwell, Flamsteed, George Hickes, Dr. John Jeffery, John Norris, Ray, South, Steele, etc. Wren, Archibald Pitcairn, and Sir Cloudesley Shovel also lived in this reign.

Au'gusta'na Col'lege, a co-educational institution in Rock Island, Ill., organized in 1860 under the auspices of the Lutheran Church; reported in 1902: Professors, 31; students, 250; volumes in the library, 18,000; ground and buildings valued at $166,000; productive funds, $225,000; income, $32,119; graduates, 881.

Au'gustine, Saint (AURELIUS AUGUSTINUS), one of the most renowned fathers of the Christian Church: b. Tagaste, in Numidia, 13 Nov. 354; d. Hippo, 28 Aug. 430. His father, Patricius, was a pagan, his mother, Monica, a Christian. He has related his own early life in the work to which he gave the title of 'Confessions.' His mother instructed him in Christianity, but for many years this faith had little influence on his life. He was long devoted to pleasure, and when quite young became father of a son by a woman with whom he was not connected by marriage. He was intended for the profession of rhetorician, and was sent to Carthage to study with this object in view. Cicero's work, 'Hortensius,' which has not come down to our times, first led him to speculative studies, and he now became a member of the sect of the Manichæans. He was one of their disciples for nine years; but after having obtained a full knowledge of their doctrine, he found it unsatisfactory and left them. In 383 he left Africa for Rome, and after a short stay there proceeded to Milan, where he was invited as a teacher of rhetoric. St. Ambrose was bishop of this city, and his eloquent discourses, combined with the study of the Scriptures, converted Augustine to the orthodox faith, and wrought an entire change in his life and character. His conversion appears to have taken place in 386. He now retired into solitude, and prepared himself for baptism, which he received in the 33d year of his life, together with his son Adeodatus, from the hands of Ambrose, his mother being then with him. Returning to Africa, he sold his estate, and gave the proceeds to the poor, retaining only enough to support him in a moderate manner. For three years he lived a retired life, devoting himself to religious duties, and to the composition of several treatises. Chancing on one occasion to be present in the church at Hippo, the bishop, who was a very old man, signified a desire to consecrate a priest to assist and succeed him. At the desire of the people Augustine entered upon the holy office, preached with extraordinary success, and in a few years became Bishop of Hippo. The remainder of his life was occupied with his ecclesiastical labors, and with various controversies in which he warmly engaged, such as those with the Donatists, the Manichæans, and more especially the Pelagians, concerning the doctrines of free-will, grace, and predestination. Augustine maintained the necessity of divine grace in determining man's moral acts to salvation, and he supported the doctrine of predestination, including election and reprobation, but always allowing for free-will and for the merit of the individual. His authority has always been very influential in the Roman Catholic Church, and his view upon any doctrinal matter has at all times carried great weight and is constantly cited in controverted questions. He died at Hippo, while the town was besieged by the Vandals. There have been more learned fathers of the Church, but none have ever more powerfully touched the human heart, and warmed it toward religion. Painters have, therefore, given him for a symbol a flaming heart. His writings (which are in Latin) are very numerous. The most celebrated are his 'Confessions' (belonging to the year 397), his 'De Civitate Dei' (On the City of God), a work on the Christian Church, his treatise on the Trinity, 'Christian Doctrine'; 'Nature and Grace'; 'Grace and Free-Will'; 'Immortality of the Soul,' and his 'Letters.' His works have been published at Paris in 22 volumes, and an English translation in 15 volumes has appeared at Edinburgh, edited by Dr. Marcus Dods See Neander, 'Church History'; Milman, 'Latin Christianity'; Farrar, 'Lives of the Fathers,' etc. Two monastic bodies, the *Augustinian Canons,* or *Black Canons,* and the *Augustinian Hermits* (q.v.), claimed to derive their origin from St. Augustine. Life by Hatzfeld.

Au'gustine, or **Austin, Saint,** the first archbishop of Canterbury: d. 26 May 604. While prior of the Benedictine monastery of Saint Andrew at Rome he was selected by Pope Gregory I., together with 39 other monks, to convert the Anglo-Saxons to Christianity, and establish the authority of the Roman See in Britain. In the spring of 597 the missionaries landed on the Island of Thanet and were kindly received by Ethelbert, king of Kent, whose wife Bertha was already a Christian. The conversion of the king speedily followed, contributing greatly to the success of Augustine's work, large numbers of persons were converted and baptized, and it was soon manifest that a new influence for good had come into the lives of

the Anglo-Saxons. In acknowledgment of his success, the Pope directed Augustine in 597 to go to Arles, where he was consecrated archbishop of Canterbury and metropolitan of England. On his return he at once informed the Pope of his success, sending a presbyter and a monk to Rome for that purpose and also to obtain instructions concerning other questions with regard to the propagating of the faith. The answer of Gregory to the archbishop's inquiries are fine examples of tact, good sense and judgment in dealing with the problems confronting the early missionaries, and instead of destroying the heathen temples they were converted into Christian churches. Saint Augustine was a zealous missionary of the Church and labored with untiring energy to extend the authority of the Church and to convert the ancient Britons, whom the English had driven into the mountains of Wales. In this, however, he was only partially successful, some of the British bishops refusing to acknowledge his authority and to unite with the English Church. Augustine died in Canterbury, and eight years afterward his body was removed to the Cathedral of Canterbury. Consult: Bede, 'Historia Ecclesiastica Gentis Anglorum'; Mason, 'The Mission of Saint Augustine to England' (1897).

Augustinianism, the system of philosophy and theology taught by Saint Augustine. In order to reach a just estimate of the teachings of Augustine, we must remember that we are not dealing with a philosopher simply, or with a theologian simply, but with one whose nature combined in a marked degree, the philosophical and theological strains together. He was both philosopher and theologian. These elements are so mixed in him at times as to reciprocally reinforce one another, but again so disparate as to cause irreconcilable inconsistencies and bold contradictions. There is a most excellent analysis of this exceedingly complex nature by Teuffel in his 'History of Roman Literature,' remarkable alike for its comprehensiveness and brevity. «Augustine combined in his character qualities seemingly opposite: an abundant imagination, and penetrating intellectual vigor, a passionate want of regard and affectionate tenderness, a tender heart and zealotism, a blind belief in superior authority and originality of thought, zeal for unity of the Church and individual piety, romanticism and scholasticism, mysticism and sophistry, poetical talent and philosophical genius, rhetorical pathos and grammatical pedantry, — himself a psychological mystery.» With this portrait of his personality before us, let us examine his teachings. For him, the source of all truth is to be found in the interpretation of the inner experience. His philosophy is primarily anthropocentric. In consciousness lies the assurance of the reality of one's own being. This is the earnest and the warrant of all reality. Without this central and elemental knowledge all other knowledge would be vague, and illusory. This assurance is given even in the very act of questioning it; for, as Augustine insists, the simple fact that I am conscious of doubting even the doubting of my own reality, is in itself an indication that I the doubter am. Man cannot escape himself. Such an analysis of the implications of self-consciousness forms a striking anticipation of Descartes' famous *Cogito ergo sum.*

With the reality of human personality firmly established upon a basis which even the most searching skepticism is unable to shake, but on the contrary the rather confirms, Augustine proceeds through a profound analysis of the human reason to disclose abundant intimations of a divine reason, and therefore of a divine being. For in his subtle examination of the processes of reason, he points out that these processes are ever working toward one and the same end,— the constructing of a body of knowledge consisting of truths universally valid, that is, truths which hold not merely for the individual but which necessarily hold for all individuals, under all circumstances and at all times. They become moreover, the norm or standard for all our thinking and their sway embraces the complete range of all human activity. These truths are so universal, so complete, so commanding as to indicate a oneness of origin which can be nothing less than that of an eternal mind. Moreover, the eternal mind must be an eternal personality. The universal truths, therefore, which lie at the basis of all thought, of all being, of all desire, and all activity are according to Augustine ideas in God. In regarding the Absolute as not merely the sum total and unification of all truth, the *unum, verum bonum,* but also a living personality, the divine Logos, we recognize the marks of the religious teacher, and in this respect Augustinianism is to be regarded as a significant advance beyond the doctrines of Neo-Platonism. From this exposition, it should not be inferred, however, that in the Augustinian psychology, the primary, or the sole basis of our conscious life is knowledge. On the contrary it is quite evident throughout the works of Augustine that he exalts the will above knowledge. He finds in consciousness three elements, *memoria, intellectus, voluntas.* Of these memoria is equivalent to a reproducible idea (*Vorstellung*), an idea which, moreover, carries with it the warrant of the reality which underlies it as its ground; *intellectus* is the judgment; and *voluntas* of course, the will. The three form a psychological trinity corresponding to the trinity which is manifested in the unity of the divine nature. Both in God and man, the will is supreme. *Omnes nihil aliud quam voluntates sunt.*

Certain difficulties emerge at this point in the exposition of the Augustinian system owing to the shifting of the point of view. The philosopher gives way to the theologian. Augustine's philosophy is essentially anthropocentric; his theology, theocentric. And in discussing the relations which obtain between God and man Augustine naturally subordinates the human to the divine, so much so indeed that the Augustinian system is severely criticised because, as it is alleged, it leads logically to a pantheism which wipes out the individuality and responsibility of man. For Augustine insists that to appreciate divine truth and the will of God for man there is need of an inner spiritual illumination, and that such an illumination comes only to the soul in which faith resides, and that faith is the gift of divine grace. Faith, therefore, must precede knowledge, that is, knowledge of things divine and knowledge of things as they are. Insight may be regarded as the fruitage, but faith is the root of knowledge. There is a grave difficulty at this point in reconciling such a doctrine with Augustine's fundamental posi-

tion which puts supreme emphasis upon the dignity and worth of man's inner nature, and the trustworthiness of that inner guiding light. It can only be said by way of explanation that in the one the theologian, and in the other, the philosopher, speaks.

Moreover, in this view of the human consciousness the primacy of the will is in a large measure denied by the insistence that man is wholly dependent upon divine grace in order to exercise his will aright. He alone is free, says Augustine, whose will has been touched by the divine will, and whose desires and activities are found wholly in accord with the will of God. The natural man is not free unless emancipated by divine grace; for Adam, the representative of humanity, the federal head of the race, abused his natural freedom of will and in his fall has left as an inheritance to the race the tendency to sin. And the most significant consequence of sin is the bondage of the will, which divine grace alone can overcome. Augustine, therefore, seems to solve the problem of free will and predestination by denying to man a real freedom. He indulges in many subtle distinctions as to the various kinds of grace. There is, for instance, the prevenient grace, also the supporting grace, active grace, and grace bestowing the gift of perseverance which seals all previous effects. No distinction, however, is drawn which relieves the system from the criticism already mentioned of minimizing the autonomy of the human will.

This position of Augustine naturally raises the question as to how the evil in the world can be reconciled with the idea of divine power and divine goodness. For if God alone is free, He alone is responsible; and man should not be held accountable for that which he unaided is unable to prevent. Such a criticism Augustine meets by the statement that the evil in the world is after all not a real evil; it is not a *causa efficiens,* but merely a *causa deficiens,* in fact only an *incausale.* Such an explanation, however, is not satisfactory and does not squarely meet the difficulty of the problem which the common experience of humanity all too unhappily emphasizes.

Augustine's type of mind is essentially that of a great systematizer of doctrine. He could rest content with no form of knowledge unless it could be reduced to a *schema* in which part fitted to part in an exact and inflexible manner. Augustine's system has been criticised for this very reason that its lines are hard and fast, yielding at no point the full rigor of its inexorable doctrines. But while in a certain sense such a criticism is justified, there was, in addition to this pronounced synoptical tendency of thought, an equally profound strain of sentiment and feeling. Augustine was essentially human, and wont to be moved by the passions and aspirations common to man. Within the very body of this system of doctrine, and its closely concatenated dogmas, it is possible to discover a deep underlying current of mysticism, which may be traced no doubt to its source in Neo-Platonism,—a mysticism manifesting itself in that compulsion of the soul, to long for communion with God, and to behold Him face to face. It is this intensely human strain, this mystical element, which relieves the Augustinian system as a system from its more severe and sombre features. The great system builder after all subordinates the system to that which is the ground of the system. Not in the processes of reason, but in a direct and immediate consciousness of God, does he find the ultimate certitude. Nothing can more beautifully or more adequately express this mystical strain in Augustine's nature than those words which embody both a philosophy and a creed: «Thou hast made me for thyself and my heart is restless until it finds rest in thee.»

JOHN GRIER HIBBEN,
Professor of Philosophy, Princeton University.

Au'gustin'ians, hermits of St. Augustine (calced), brotherhood of churchmen, devoted to the spread throughout Christendom of the principles of the higher life, of religion as well as earthly science, and searchers, too, after peace of the spirit, established in the 4th century, at Tagaste in Africa, by the famed St. Augustine, later Bishop of Hippo and illustrious doctor of the Church. Up to the 13th century Augustinians were engaged mainly in the practices of ascetic life, a course of seclusion, or retirement from the bustle and troubles of worldly affairs in trade, politics, commerce. As hermits, at first they lived, some alone in their cells in out-of-the-way places in forest and mountain, others in community-groups outside of towns. Here their life was passed in quiet, in contemplation, study, prayer, copying MSS., and manual toil, as farm, and garden-work, reclaiming waste lands, digging canals for irrigation and drainage. Eminent among them in this peaceful era were two reformers of their brotherhood, famed in hagiography, who by centralizing the energies of their followers on set lines of work, sought to render their societies more potent factors for the common good, as adepts in intellectual, artistic, and more industrial spheres. William IX., duke of Aquitaine, an old-time leader in the crusades, now a dweller in a monastery of the Tuscan hills, and John Bonus, The Good, of Mantua, a one-time strolling player by profession, now penitent, who by their wonderful powers of nature and grace employed in the service of their respective communities, reached high rank in the world of saintly heroism in southern Europe, in France, and Italy, then in the north, in Germany and England, wherein were founded congregations under their rule. Spreading thence throughout the various quarters of Christendom, especially in western Europe, their followers settled in Spain, Portugal, Belgium, and Ireland, where they established houses of their brotherhood in the principal cities and towns of the civilized world. In 1256, in pursuance of the designs of his predecessors in the papal chair, Alexander IV. moved to ensure the complete union of all the different congregations of Augustinians in Europe, succeeded finally in merging their several branch orders into one body politic and social under the leadership of Lanfranc Septala, of noble Milanese birth, the first superior general of the Augustinian Hermits, chosen thereto in the first general chapter of the brethren at Rome in the above year. Nor were the successors of Alex-

ander slow in their recognition of the powers of this new association. To them were entrusted several places of honor in the pontifical court, among them the offices of apostolic confessor, of librarian, papal sacristan, the latter subsequently declared by Sixtus IV. as of perpetual right of the Augustinians. Not long after they were entrusted with the collection of papal revenues in many countries, and even charged by some of the republics of Italy with the handling of state funds.

In the Middle Ages as in later days many of this brotherhood won fame in the higher realms of life, by their gifts of spirit in science and art, as saints, writers, masters in theology, Scripture-study, philosophy, history, law, antiquities, letters and poetry. Celebrated as teachers in schools of their order as well as outside were such masters as Egidius Colonna of Rome, known as the "Fundamental Doctor"; then Augustine of Ancona, who won renown in scholastic theology; John Capgrave in history; Onuphrius Panvinio in antiquities; Luis de Leon in theology and poetry; John Laurence Berti in history; John Baptist Cotta in poetry, John Michael Cavalieri in liturgy, and lately Augustine Ciasca in Oriental languages. Eminent for their supernatural gifts, many of the most singular character, were Nicholas of Tolentine, "wonder-worker of the Church," so styled by Pope Eugene IV.; Clare of Montefalco, the stigmatized, in whose heart were discovered the insignia of Christ's passion; Rita of Cascia, ecstatic, known as "the saint of the impossible"; Thomas of Villanova, almsgiver of Spain, and John de Schagun, reformer of the clergy of that country. They are of prominence from the 16th century especially in various mission fields in Mahometan and heathen countries; in Asia, in China, India, Persia, Japan, and the Philippines; in Africa, in Zanzibar, Mozambique, and the Guineas; then in America, both north and south, and Australia. In later times during the closing years of the 18th century, was established the first English-speaking branch of the Augustinians in the United States, where, in 1796, a house of that brotherhood was opened in Philadelphia, by two members of Irish blood,— Dr. Matthew Carr and John Rosseter,— the latter said to have been formerly an officer under Rochambeau. They are the calced communities. Here their aim chiefly has been mission work among the faithful in pulpit and school. Offshoots from Philadelphia, now thriving in the United States as well as in Cuba and the Philippines are some 20 convents and houses of the order, as mission-centres, with 113 members in residence or in study-houses in Europe. Seventy-five are priests, actively engaged in two colleges, one of them in Havana, 1 academy, 10 parish-schools, besides the congregations of 29 parishes. Furthermore attached to every central establishment the Augustinians have charge of various guilds, or societies, devoted to such aims as religion, social improvement, beneficence in the promotion of good works in the several fields of charity, patriotism, letters, and science.

THOMAS C. MIDDLETON, O. S. A.

Augus'tulus, Romulus, the son of Orestes, a general of the Roman emperor Julius Nepos. Orestes deposed the emperor, and placed his son upon the throne, in 475. In the following year Odoacer, a commander of the German forces in the Roman service, revolted, put Orestes to death, obliged Augustulus to resign, and thus put an end to the Roman empire in the West. The emperor's name was originally Romulus Augustus, but the Romans changed the latter into the diminutive form Augustulus, out of contempt for his character.

Augus'tus, Gaius Julius Cæsar Octavianus, originally called GAIUS OCTAVIUS, the celebrated Roman emperor: b. 23 Sept. 63 B.C.; d. Nola, 19 Aug. 14 A.D. He was the son of Gaius Octavius and Atia, a daughter of Julia, the sister of Julius Cæsar. The Octavian family originated at Velitræ, in the country of the Volscians. The father of Octavius had risen to the rank of senator, and had gone to Macedonia, after being chosen prætor, where he was a civil and military officer. Octavius lost his father when young, but was carefully brought up by his mother and L. Marcius Philippus, the second husband of Atia. His talents gained him the regard of his great-uncle, Julius Cæsar, who declared himself willing to adopt him as his son, in case he himself should remain without children. Octavius was studying under the renowned orator Apollodorus, when he received the news of the tragic death of his uncle, and of his having adopted him as his son. Notwithstanding the anxiety of his friends, he went to Italy, and on landing at Brundusium, deputies from the veterans collected there came to him. Conducted in triumph to the city, and saluted as the heir and avenger of Cæsar, he made his adoption publicly known, and took the name of his uncle, adding to it that of Octavianus. He then advanced to Rome, where there were now two parties, that of the republicans, who had killed Cæsar, and that of Antony and Lepidus, who, under the pretense of avenging him, strove to establish their own authority. Octavianus addressed himself first to Cicero, at Cumæ, being desirous to gain over this great orator, and from thence he went to Rome, where the greater part of the magistrates, soldiers, and citizens came to meet him, Antony alone paying no attention to his return. After Octavianus had caused his adoption to be confirmed in the most solemn manner, he went to Antony, and demanded of him the inheritance left him, in order to pay the legacies mentioned in his uncle's will. Antony at first haughtily refused to acknowledge his claims, but changed his attitude when he found the influence of Octavianus continually increasing, and his own proportionably diminishing. There could be no real union, however, between two equally ambitious rivals. In their hearts they cherished reciprocal hatred and jealousy; and their enmity was so little a secret that Octavianus was accused of having wished to get Antony murdered. He afterward, when Antony, together with Lepidus, entered Italy at the head of a powerful army, united with him, and a triumvirate was formed by the three generals, who defeated the republican army under Brutus and Cassius, at Philippi in Macedonia (42 B.C.). After his return to Rome he satisfied the demands of his soldiers by dividing among them confiscated lands. This division caused great disturbances. In the midst of the stormy scenes which convulsed Italy, he was obliged to contend with Fulvia, whose daughter, Clodia, he had rejected, and with Lucius, the brother-in-law o:

Antony. After several battles, Lucius threw himself into the city of Perusia, where he was soon after obliged to surrender. The city was given up to be plundered, and 300 senators were condemned to death. After the return of Antony, an end was put to the proscriptions. Octavianus allowed such of the proscribed persons as had escaped death by flight, and whom he no longer feared, to return. There were still some disturbances in Gaul, and the naval war with Sextus Pompeius continued for several years. By a skilful course of conduct he brought about the defeat of Pompeius and reduced Lepidus to a nullity, thus leaving Antony alone as his rival. The empire was now divided between him and Antony; but while the former, in the East, gave himself up to a life of luxury, the young Octavianus pursued his plan of making himself sole master of the world. He especially strove to obtain the love of the people. He displayed mildness and magnanimity, without the appearance of striving after the highest power, and declared himself ready to lay down his power when Antony should return from the war against the Parthians. He appeared rather to permit than to wish himself to be appointed perpetual tribune — an office which gave him supreme power. The more he advanced in the affections of the people, the more openly did he declare himself against Antony.

By making public a will, wherein his rival appointed his sons by Cleopatra his heirs, he stirred up the ill-will of the Romans against him. Availing himself of this feeling, Octavianus declared war against the queen of Egypt, and led a considerable force, both by sea and land, to the Ambracian Gulf. Here his admiral Vipsanius Agrippa gained the naval victory of Actium (q.v.), which made Octavianus master of the world, 31 B.C. He pursued his rival to Egypt, and ended the war, after rejecting the proposal of Antony to decide their differences by a personal combat. Cleopatra and Antony having killed themselves, Octavianus caused them to be buried with imposing ceremonies. A son of Antony and Fulvia was sacrificed to ensure his safety, and Cæsarion, a son of Cæsar and Cleopatra, shared the same fate. All the other relations of Antony remained uninjured, and Octavianus, on the whole, used his power with moderation. He spent two years in the East, in order to arrange the affairs of Egypt, Greece, Syria, Asia Minor, and the islands. On his return to Rome he celebrated a triumph for three days in succession, and (29 B.C.) closed the temple of Janus — for the third time since the foundation of Rome. Freed from his rivals and enemies, and master of the world, he is said to have been undecided as to how he should exercise his power, or whether he should even retain it. He first set about correcting the abuses which had prevailed during the civil war, established a general peace, ejected unworthy members from the Senate, restored ruined temples, and built new ones.

At the end of his seventh consulship, he entered the Senate house, and declared his resolution to lay down his power. The Senate, astonished at his moderation, besought him to retain it. He yielded to their pressing entreaties, and continued to govern through them. He now obtained the surname of Augustus, which marked the dignity of his person and rank, and united, by degrees, in himself, the offices of imperator, or commander-in-chief by sea and land, with power to make war and peace; of proconsul over all the provinces; of perpetual tribune of the people, which rendered his person inviolable, and gave him the power of interrupting public proceedings; and, in fine, of censor, and pontifex maximus, or controller of all religious matters. The laws themselves were subject to him, and the observance of them depended upon his will. It was the spirit of his policy to retain old names and forms, but he steadfastly refused to assume the title of dictator, which latterly had become especially odious. He conducted many wars in Africa, Asia, and particularly in Gaul and Spain, where he triumphed over the Cantabrians after a severe struggle. His arms subjected Aquitania, Pannonia, Dalmatia, and Illyria, and held the Dacians, Numidians, and Ethiopians in check. He concluded a treaty with the Parthians, by which they gave up Armenia, and restored the eagles taken from Crassus and Antony. At the foot of the Alps he erected monuments of his triumphs over the mountaineers, the proud remains of which are yet to be seen at Susa and Aosta. After he had established peace throughout the empire, he again closed the temple of Janus. But this peace was interrupted, 9 A.D., by the defeat of Varus, who lost three legions in an engagement with the Germans, under Arminius, and killed himself in despair. The information of this misfortune greatly agitated Augustus. He let his beard and hair grow, and often cried out in the deepest grief, "O Varus, restore me my legions!" Meanwhile the Germans were held in check by Tiberius. During the peace, Augustus had issued many useful decrees, and abolished abuses in the government. He gave a new form to the Senate, employed himself in improving the manners of the people, particularly by promoting marriage, enacted laws for the suppression of luxury, introduced discipline into the armies, and order into the games of the circus. He adorned Rome in such a manner that it was truly said, "He found it of brick, and left it of marble." He made journeys, as Velleius says, everywhere, to increase the blessings of peace; he went to Sicily and Greece, Asia Minor, Syria, Gaul, etc.; in several places he founded cities and colonies. The people erected altars to him, and, by a decree of the Senate, the month Sextilis was called August. The debauchery of his daughter Julia gave him great pain, and he showed himself more severe against those who destroyed the honor of his family, than against those who threatened his life. History says that, in his old age, he was ruled by his wife Livia, the only person, perhaps, whom he truly loved. He had no sons, and lost by death his sister's son, Marcellus, and his daughter's sons, Gaius and Lucius, whom he had appointed his successors. Also, Drusus, his son-in-law, whom he loved, died early; and Tiberius, the brother of the latter, whom he hated, on account of his bad qualities, alone survived.

These numerous calamities, together with his continually increasing infirmities, gave him a strong desire of respose. He undertook a journey to Campania, from whose purer air he hoped for relief; but disease fixed upon him, and he died, in the 79th year of his age, and 45th of his reign. When he felt his death approaching he is said to have called for a mirror, arranged his hair, and demanded of the by-standers,

«Have I played my part well?» and, an answer being returned in the affirmative, «Then,» added he, using the form of the players, «farewell, and applaud» (*valete, et plaudite*). If this last passage in the life of Augustus is true, it is certainly indicative of his character, his policy, and even of his fortune. He conquered Brutus by means of Antony, and Antony by means of Agrippa. He several times changed his party, but never his purposes, and knew how to cause power to be offered, and pressed upon him, while it was, in fact, the object of all his exertions. It cannot be denied that he used his power with wisdom, and became the benefactor of his country, which he had previously plunged into the horrors of civil war. His taste and active mind led him to favor and protect the learned; and he even exercised the art of the poet himself; so that he was not unworthy of giving his name to an age distinguished for intellectual creations. His death plunged the empire into the greatest grief. He was numbered among the gods, and temples and altars were erected to him. See Gardthausen, 'Augustus und seine Zeit' (1891); Schuckburg, 'Augustus' (1903).

Augus'tus I., elector of Saxony: b. 1526; d. 1586. During a peaceful reign, he greatly beautified Dresden, his capital, and built the palace of Augustenburg.

Augus'tus II., Frederick, elector of Saxony and king of Poland, second son of John George III., elector of Saxony: b. Dresden, 1670; d. 1 Feb. 1733. He was noted for his activity. In 1695 he became elector and in 1696 was candidate for the vacant Polish throne. The French ambassador and the nobles supported the Prince of Conti, but Augustus by acceptance of the Roman Catholic faith, by bribery and intimidation secured the election, 27 June 1697. Early in his reign, a treaty was made between Denmark, Poland, and Russia against Charles XII. of Sweden, for the conquest of Livonia. But Charles, after having defeated the Danes and the Russians, turned toward Poland. Thus began the celebrated Northern war, which lasted 20 years. Charles gained a complete victory, 20 July 1702, and on 1 May 1703, the Saxon army was defeated again at Pultusk. The diet assembled at Warsaw declared Augustus, 14 Feb. 1704, incapable of wearing the crown of Poland, and Stanislaus Lesczinsky, waywode of Posen, was chosen king, 12 July 1704. Charles, victorious on every side, advanced into Saxony, and Augustus found himself obliged to negotiate a secret peace, at Altranstadt, 24 Sept. 1706.

He now devoted himself to the domestic affairs of Saxony. His love of splendor involved him in many expenses, by which the finances of his kingdom were disordered. In 1709, after the defeat of Charles at Pultawa, the Poles recalled Augustus, who united himself anew with Peter the Great. A confederation was now formed in Poland against the Saxon troops, by the party of Stanislaus, in the belief that Augustus was aiming at absolute power. The Saxons were attacked and obliged to surrender. At length, through the mediation of Peter, an arrangement was concluded at Warsaw, 1717, between Augustus and the Polish leaders. The Saxon troops were removed from the kingdom, and Augustus agreed not to maintain more than 17,000 soldiers in Poland, who were to be under the Polish authorities. The last years of his reign were characterized by boundless luxury and corruption of manners. He was not disliked by his subjects, and filled with dignity his station among the European powers. In his character generous ideas were united with despotic feelings, a taste for pleasure with the cares of ambition, and the restlessness of a warlike spirit with the effeminacy of a luxurious life. By his mistresses he had many children. The Countess of Königsmark bore him the celebrated Maurice of Saxony.

Augus'tus III., Frederick, elector of Saxony and king of Poland, son of Augustus II.: b. Dresden, 1696; d. there 5 Oct. 1763. He succeeded his father as elector in 1733. A part of the Polish nobility chose Augustus king; and in 1736 he was first generally recognized as such by the congress assembled at Warsaw to conclude a peace. Although without the great and amiable qualities of his father, in other respects he closely followed his example, distinguishing himself by the splendor of his feasts and the extravagance of his court. His system of politics consisted in entire dependence upon Russia. He preferred Dresden to Warsaw, and through his long absence from Poland the government sank into entire inactivity. When Frederick attacked Saxony itself in 1745, Augustus deserted his capital, and preserved his pictures and porcelain, but lost the archives of the state, which fell into the hands of the victors. By the peace of Dresden, 25 Dec. 1745, he was reinstated in the possession of Saxony, in the next year. In 1756 he saw himself involved anew in a war against Prussia, and fled to Königstein, and afterward to Poland. His authority in this country had always been inconsiderable, and after the loss of Saxony, became still more insignificant. The accession of Catherine to the Russian throne was a source of disquietude, for she sought to deprive the Saxon princes, who were allies of France, of the Polish thrones. The Peace of Hubertsberg was hardly concluded when Augustus returned from Warsaw to Dresden, where he died. His son, Frederick Christian, succeeded him as elector of Saxony, and Stanislaus Poniatowsky as king of Poland.

Auk, âk, a diving sea-fowl of the family *Alcidæ* found in the northern regions, the term covering guillemots, murres, lomvias, puffins, and others. They are thick-set birds, seldom more than a foot long, which move about with difficulty on land, from the fact that their legs are set very far back, giving them an erect, penguin-like attitude. In color they are dark brown, black, or lead-color above, and white beneath, except in the breeding season, when bright colors and ornamental plumes temporarily appear on the males of some species. The wing-feathers are so short as to be of little service for flight, and the wings are more used as aids in swimming under water, where they pursue fishes with great speed. The bill is much compressed, but in the breeding season, among the puffins, which show the most marked compression of bill at other times, the bills increase in size and develop ornamental appendages which disappear as the moulting season comes on. The most important North Atlantic auks are the now-extinct great auk (*plautus impennis*) which was as large as a goose and within historic times abounded as far south as the Hebrides

(see GAREFOWL); the little auk (*Alle alle*), not larger than a robin and very abundant, sometimes in winter coming as far south as New York and the Great Lakes (see DOVEKIE); and the razor-billed auk (*Alca torda*), which has a bill of remarkable length and sharpness, and which breeds even as far south as the Maine coast. (See MURRELET; PUFFIN; RAZOR-BILL.) The auk lays only a single large egg, which, as no nest is prepared, the parents care for by holding upon the top of their webbed feet and between their thighs. These eggs are a staple food for the natives of the arctic regions, as are the birds, also. They are taken in summer and preserved for winter use, as in the autumn the auks migrate from the frozen coasts and spend the winter in the open spaces of the sea. Consult American and British ornithologies; and Selous, 'Bird Watching' (1901).

Auld Lang Syne, âld lạng sīn, a song attributed to Burns, who added a couple of stanzas to a poem known to have existed in 1600 and set to an old Lowland air by George Thompson.

Auld Licht Idylls, âld lĭcht ī'dĭlls, a work by James M. Barrie. It is a series of 12 sketches of life in Glen Quharity and Thrums. In all of them the same characters appear.

Auld Rob'in Gray, a famous Scottish ballad by Lady Anne Barnard, published anonymously in 1722, but unacknowledged till 1825.

Au'lic (Latin, *aula,* a court or hall), a term applied to a council (the *Reichshofrath*) in the old German empire. It was one of the two supreme courts of the German empire, the other being the court of the imperial chamber (*Reichskammergericht*). It had not only concurrent jurisdiction with the latter court, but in many cases exclusive jurisdiction, in all feudal processes, and in criminal affairs, over the immediate feudatories of the emperor and in affairs which concerned the imperial government. The title is now applied in Germany in a general sense to the chief council of any department, political, administrative, judicial, or military.

Aulich, ow'lih, Ludwig, Hungarian general: b. Presburg, 1792; d. Arad, 6 Oct. 1849. After the evacuation of Pesth by the imperial troops in 1849, Aulich made his triumphant entry into that capital, and was received with enthusiasm by the people. In his famous proclamation of Gödöllö, Kossuth paid also an appropriate homage to Aulich's gallantry. Subsequently, when Görgey was forced to renounce either the army or the ministry of war, he took the latter alternative, and Aulich was appointed his successor. But although he might have used his authority as minister of war to frustrate Görgey's negotiations with the Russians, he actually assisted Görgey to bring these negotiations to a successful close. He was then delivered over to Austria by the Russians, and, in company with 12 others, perished on the gallows.

Au'lis, in ancient Greece, a seaport in Bœotia, on the strait called Euripus, between Bœotia and Eubœa, noted chiefly for its temple of Artemis, and as the scene of the sacrifice of Iphigenia.

Aullagas, owl-lä'gas, a salt lake in Bolivia, which receives the surplus waters of Lake Titicaca through the Rio Desaguadero, and has only one perceptible, insignificant outlet. The disposition of its superfluous water is, therefore, still a matter of uncertainty.

Au'lula'ria (from *Aulula,* a pot), a comedy by Plautus. Euclion, an old miser, is the principal character.

Aumale, ō-mal', **Henri Eugène Philippe Louis d'Orleans, Duke of,** 4th son of king Louis Philippe: b. Paris, 16 Jan. 1822; d. 7 May 1897. He entered the military service at the age of 17, and distinguished himself by his bravery. At the age of 20, he was promoted to the rank of brigadier-general, and was sent to Algeria, in October 1842. Intrusted with the command of the district of Medeah, he attacked the smala of Abd el Kader with such impetuosity that in less than two hours the emir's troops were entirely routed. As a reward, Aumale was made lieutenant-general and commander of the province of Constantine. In 1847, the young prince, but 25 years old, was intrusted with the general governorship of Algeria, which was taken from the hands of Marshal Bugeaud. This appointment was not approved either by the army or the French nation, and it was the occasion for loud complaints against the ambition of the king, who was concentrating the direction of the whole military service in the hands of his sons. After the revolution of 1848, he went to England, where he devoted his attention to literary pursuits. His latest years were passed in Sicily. He wrote 'Les Institutiones Militaires de la France' (1867); 'Histoire des Princes Conde' (1869).

Aumale, a town in France, 35 miles northeast of Rouen, which has given titles to several notables in French history: Jean d'Arcourt, Eighth Count d'Aumale, fought at Agincourt, and defeated the English at Gravelle (1423). Claude II., Duc d'Aumale, one of the chief instigators of the Massacre of St. Bartholomew, was killed 1573. Charles de Lorraine, Duc d'Aumale, was an ardent partisan of the League in the politico-religious French wars of the 16th century. Pop. (1900) 2,219.

Aumont, ō-môn', the name of one of the great historical families of France. The first Aumont mentioned in history is JEAN III., SIRE D'AUMONT, who, in 1328, took part in the battle of Cassel, and served under Philip de Valois, on many other important occasions. A more distinguished member of the family was JEAN D'AUMONT: b. 1522; d. 1595. He was on the battlefield almost from his cradle to his grave, and served under six kings: Francis I., Henry II., Francis II., Charles IX., Henry III., and Henry IV. ANTOINE D'AUMONT: b. 1601; d. 1669; served with distinction under Louis XIV., and in 1662 was appointed governor of Paris. LOUIS MARIE VICTOR D'AUMONT and DE ROCHEBARON: b. 1632; d. 1704; took an active part in the war in Flanders under Louis XIV., was governor of Boulogne and the Boulonnois, and member of the academy of inscriptions and belles-lettres. JACQUES, DUC D'AUMONT: b. 1732; d. 1799; was the commandant of the national guard, on 5 Oct. 1789, when Louis XVI. was forcibly taken away from Versailles. LOUIS MARIE CÉLÉSTE DE VIENNE, DUC D'AUMONT: b. 1762; d. 1831; served in Germany, Spain, and Sweden, until the restoration, when he was appointed lieutenant-general. He made

himself very useful to the cause of royalty in suppressing the troubles in Normandy, and in 1815 was created peer of France, and raised to the office of first chamberlain. He was one of the most prominent men at the courts of Louis XVIII. and Charles X., but he exchanged politics for theatres, and became the chief director of the comic opera.

Aungerville, ân'gėr-vĭl, **Richard,** known as Richard de Bury (from his birthplace, Bury St. Edmunds), an English statesman, bibliographer, and correspondent of Petrarch: b. 1281; d. 1345. He entered the order of Benedictine monks, and became tutor to the Prince of Wales, afterward Edward III. Promoted to several offices of dignity, he ultimately became Bishop of Durham, and Lord Chancellor of England. He made the acquaintance of many of the eminent men of the day, and was a diligent collector of books. He was the author of 'Philobiblon,' 'Epistolæ Familiarium,' including letters to Petrarch, etc.

Aura. See Epilepsy.

Au'ramine. See Coal Tar Colors.

Aurangabad, ow-rŭn'ga-bäd', a town in India; 175 miles from Bombay, and on the Kaum River, a small tributary of the Godavery. It is surrounded by walls with semicircular towers at the different angles, and contains a ruined palace of Aurengzebe and a mausoleum erected to the memory of his favorite wife. A mile to the west of the town are cantonments for cavalry, infantry, and artillery. Aurangabad was founded early in the 17th century, and rose to be a considerable trading centre, but its commercial importance decreased when Hyderabad became the capital of the Nizam. In late years the trade has revived considerably, and embraces wheat, cotton, and manufactured goods. Pop. (1891) 33,887.

Auran'tia. See Coal Tar Colors.

Au'rates. See Auric Acid.

Aurbacher, owr'bä-hėr, **Ludwig,** German author: b. 1784; d. 1847; well remembered by his 'Volksbüchlein' (1827–9); a collection of popular tales, ranking among the best productions of this kind in German literature.

Aure'lia. See Jellyfish.

Aure'lian, Lucius Domitius Aurelianus, one of the later emperors of Rome: b. about 212; d. 275. He was the son of a peasant of Illyricum, and rose to the highest rank in the army, and even to the consulate; which good fortune was increased by a wealthy marriage. Claudius II., on his death-bed, in 270, recommended Aurelian to the choice of the troops of Illyricum, who readily acceded to his wishes. He delivered Italy from the barbarians, reduced Tetricus, who had been unwillingly made to assume the purple in Gaul, and conquered the famous Zenobia, queen of Palmyra. Aurelian followed up his victories by the reformation of abuses, and the restoration throughout the empire of order and regularity, but tarnished his good intentions by the general severity of his measures, and the sacrifice of the senatorian order to his slightest suspicions. He had planned a great expedition against Persia, and was waiting in Thrace for an opportunity to cross the straits, when he lost his life by assassination, the result of a conspiracy excited by a secretary whom he intended to call to account for peculation. Aurelian was a wise, able, and active prince, and well deserved the title given him by the Senate of "Restorer of the Roman Empire."

Aure'lian, a historical novel by William Ware, an American author born in 1797. It was first published in 1838 under the title 'Probus,' and was a sequel to 'Letters of Lucius M. Piso,' published the year before; and like that novel, written in the form of letters. The full title is 'Aurelian; or, Rome in the Third Century. In Letters of Lucius M. Piso, from Rome, to Fausta, the daughter of Gracchus at Palmyra.' The novel presents a singularly faithful picture of the Rome of the second half of the 3d century.

Aure'lian Wall, a wall around Rome, built mostly by the emperor Aurelian, but completed in the reign of Probus. It was almost 12 miles long, and 54 feet high, enclosing an area of 5,000 square miles, and marking the boundaries of Rome in the time of Aurelian. The wall was built in great haste as a defense against the barbarians, and includes the remains of house- and garden-walls. It was fairly well preserved until recently, but is now rapidly falling to decay.

Aure'lius Antoninus, Marcus, often called simply Marcus Aurelius, a distinguished Roman, and according to Canon Farrar, "the noblest of pagan emperors": b. Rome, 29 April 121 A.D.; d. Vindobona,— the modern Vienna — 17 March 180 A.D. He was descended from an illustrious line which tradition declared extended to the good Numa, the second king of Rome. In the descendant Marcus were certainly to be found, with a great increment of many centuries of noble life, all the virtues of his illustrious ancestor. Doubtless the cruel persecutions of the infamous emperors who preceded Hadrian account for the fact that the ancestors of Aurelius left the imperial city and found safety in Hispania Bætica, where in a town called Succubo, — not far from the present city of Cordova — the emperor's great-grandfather, Annius Verus, was born. From Spain also came the family of the emperor Hadrian, who was an intimate friend of Annius Verus. The death of the father of Marcus Aurelius when the lad was of tender years led to his adoption by his grandfather and subsequently by Antoninus Pius. By Antoninus he was subsequently named as joint heir to the imperial dignity with Commodus, the son of Ælius Cæsar, who had previously been adopted by Hadrian. From his earliest youth Marcus was distinguished for his sincerity and truthfulness. "Hadrian's bad and sinful habits left him," says Niebuhr, "when he gazed on the sweetness of that innocent child. Punning on the boy's paternal name of Verus, he called him Verissimus, 'the most true.'" Among the many statues of Marcus extant is one representing him at the tender age of eight years offering sacrifice. He was even then a priest of Mars. It was the hand of Marcus alone that threw the crown so carefully and skilfully that it invariably alighted upon the head of the statue of the god. The entire ritual he knew by heart. The great emperor Antoninus Pius lived in the most simple and unostentatious manner; yet even this did not satisfy the exacting, lofty spirit of Marcus. At 12 years

of age he began to practise all the austerities of Stoicism and became a veritable ascetic. He ate most sparingly; slept little, and when he did so it was upon a bed of boards. Only the repeated entreaties of his mother induced him to spread a few skins upon his couch. His health was seriously affected for a time; and it was, perhaps, to this extreme privation that his subsequent feebleness was largely due. His education was of the highest order of excellence. His tutors, like Nero's, were the most distinguished teachers of the age; but unlike Nero, the lad was in every way worthy of his instructors. His letters to his dearly beloved teacher, Fronto, are still extant, and in a very striking and charming way they illustrate the extreme simplicity of life in the imperial household in the villa of Antoninus Pius at Lorium by the sea. They also indicate the lad's deep devotion to his studies and the sincerity of his love for his relatives and friends. When his predecessor and adoptive father Antoninus felt the approach of death, he gave to the tribune who asked him for the watchword for the night the reply "Equanimity," directed that the golden statue of 'Fortune' that always stood in the emperor's chamber be transferred to that of Marcus Aurelius, and then turned his face and passed away as peacefully as if he had fallen asleep. The watchword of the father became the life-word of the son, who pronounced upon that father in the 'Meditations,' one of the noblest eulogies ever written. It would be impossible here to detail even briefly all the manifold public services rendered by Marcus Aurelius to the empire during his reign of 20 years. Among his good works were these: the establishment, upon eternal foundation, of the noble fabric of the civil law — the prototype and basis of Justinian's task; the founding of schools for the education of poor children; the endowment of hospitals and homes for orphans of both sexes; the creation of trust companies to receive and distribute legacies and endowments; the just government of the provinces; the complete reform of the system of collecting taxes; the abolition of the cruelty of the criminal laws and the mitigation of sentences unnecessarily severe; the regulation of gladiatorial exhibitions; the diminution of the absolute power possessed by fathers over their children and of masters over their slaves; the admission of women to equal rights to succession to property from their children; the rigid suppression of spies and informers; and the adoption of the principle that merit, as distinguished from rank or political friendship, alone justified promotion in the public service. But the greatest reform was the reform in the imperial dignity itself, as exemplified in the life and character of the emperor. It is this fact which gives to the 'Meditations' their distinctive value. The infinite charm, the tenderness, and sweetness of their moral teachings, and their broad humanity, are chiefly noteworthy because the emperor himself practised in his daily life the principles of which he speaks, and because tenderness and sweetness, patience and pity, suffused his daily conduct and permeated his actions. The horrible cruelties of the reigns of Nero and Domitian seemed only awful dreams under the benignant rule of Marcus Aurelius. It is not surprising that the deification of a deceased emperor, usually regarded by senate and people as a hollow mockery, became a veritable fact upon the death of Marcus Aurelius. He was not regarded in any sense as mortal. All men said he had but returned to his heavenly place among the immortal gods. As his body passed, in the pomp of an imperial funeral, to its last resting-place, the tomb of Hadrian,— the modern Castle of St. Angelo at Rome, — thousands invoked the divine blessing of Antoninus. His memory was sacredly cherished. His portrait was preserved as an inspiration in innumerable homes. His statue was almost universally given an honored place among the household gods. And all this continued during successive generations of men. Marcus Aurelius has been censured for two acts: the first, the massacre of the Christians which took place during his reign; the second, the selection of his son, Commodus, as his successor. In extenuation of his persecution of the followers of Christianity, it has been alleged in his behalf that he was deceived by evil councillors, who misrepresented the conduct of the Christians to him. This excuse impinges upon his wisdom as a ruler and his admittedly wide knowledge of the conditions of the empire. It is further urged that when we take into consideration the environment of the emperor, no just cause for condemnation of his course remains. He imbibed a bitter prejudice against the new religion from his beloved friend and instructor, Fronto. In the writings of Epictetus, whom he greatly revered, he found severe condemnation of the Christians as fanatics. With such a profound natural bias, it is urged, it is no wonder that he was led to regard the new creed with aversion. But the reason of his course is to be found rather in his deep-rooted attachment to the heathen beliefs of his ancestors and of the empire. It was rather his fear that the ancient cult, bound up as it seemed in the character of Roman rule, was seriously menaced by the progress of Christianity, which actuated him to the severe and bloody measures he took to root out a dangerous rival. Regarding Christianity as a «pernicious sect,» a «secret conspiracy» against the empire, an «immoral superstition,» whose poison was eating into the social life, and himself as the conservator of the empire and its traditions, some extenuation might be conceded to such fierce zeal in persecuting the Christians in almost any other emperor that Marcus Aurelius. For there is a glaring inconsistency in his character in the adoption of so cruel and monstrous a course by one who appears otherwise so admirable. In this signal instance he is as bloody and heartless as a Domitian, a Nero or a Caligula; in all other things merciful, in this pitiless; in his general administration, just and humane; in this, singularly unjust and even vindictive. Whatsoever may be urged in his defense, this relentless persecution of the Christians is a dark blot on his fame. Whatever extenuating circumstances may seem to condone it, his policy in this instance was utterly inconsistent with his general character.

His first edict against the Christians was published in 177. Multitudes perished in the fierce persecutions which followed. Notable amongst the victims were St. Polycarp in Smyrna and St. Caecilia at Rome. The manner in which they were tortured before being relieved from sufferings by death was more befitting a savage chief than a civilized ruler.

Of the appointment of Commodus as his successor, it may be said that the paternal heart hoped against hope for filial excellence. Marcus Aurelius believed, as clearly appears from many passages in the 'Meditations,' that men did not do evil willingly, but through ignorance; and that when the exceeding beauty of goodness had been fully disclosed to them, the depravity of evil conduct would appear no less clearly. The emperor who, when the head of his rebellious general was brought to him, grieved because that general had not lived to be forgiven; the ruler who burned unread all treasonable correspondence, would not, nay, could not believe in the existence of such an inhuman monster as Commodus proved himself to be. The appointment of Commodus was a calamity of the most terrific character; but it testifies in trumpet tones to the nobility of the emperor's heart, the sincerity of his own belief in the triumph of right and justice. See Farrar, 'Seekers after God' (1868); Renan, 'Marc Aurèle' (1881); Pater, 'Marius the Epicurean.'

Aure'lius Victor, Sextus, Roman historian of the 4th century whose 'History of the Cæsars' is a collection of biographical sketches of the emperors from Augustus to Constantine.

Aurengzebe, â'rĕng-zēb'. See AURUNGZEBE.

Au'reo'la, or Aureole, in paintings, an illumination surrounding a holy person, as Christ, a saint, or a martyr, intended to represent a luminous cloud or haze emanating from him. It is generally of an oval shape, but may be nearly or quite circular, and differs from the nimbus surrounding the heads of sacred personages in being an emanation of light from the whole body.

Aure'osin. See COAL TAR COLORS.

Aureus, â'rę-ŭs, or **Aureus Nummus,** the earliest gold coin of Rome, coined 207 B.C., in the second Punic war. It weighed 2 denarii, and 1 quinarius, and was worth 25 denarii, or 100 sesterces. In later times it was called *solidus,* but had diminished in value.

Auric Acid. Trioxid of gold, Au_2O_3, does not combine with acids to form salts, but a hydrated form of the oxid, $Au_2O_3.H_2O$, is known, which unites with bases to form salts. From this acid-like property, the hydrated oxid has been called "auric acid." Compounds of auric acid with bases are called "aurates." Aurate of potassium, $Au_2O_3.K_2O.3H_2O$, is a crystalline substance, readily dissolving in water with the formation of an alkaline solution. When digested with ammonium sulphate, it yields an aurate of ammonia of undetermined composition, called "fulminating gold." This substance, yellowish-brown in color when in the solid form, decomposes explosively upon percussion, or when heated to 212° F.

Aurichal'cite (-kal'-), a native basic carbonate of copper and zinc, usually occurring in beautiful bright blue or green, pearly incrustations, composed of ill-defined monoclinic (?) crystals or scales. Its hardness is 2, and its specific gravity about 3.6. It has been found in Greece, Italy, England and various other European countries, and in fine specimens at Morenci in Arizona, Magdalena in New Mexico, in Colorado, Montana, Utah and elsewhere.

Auricle. See EAR.

Auricles of the Heart. See HEART; CIRCULATION.

Auric'ula, a hardy perennial herb, *Primula auricula,* of the natural order *Primulaceæ,* found in the mountainous parts of central Europe. The wild plant has an umbel of small yellow flowers on a short stalk, which rises from a set of radial leaves. By selection a very large number of varieties have been produced. These have long stalks and very diversely colored, fragrant large flowers, for which the plant is widely cultivated in Europe. Since the climate of the United States is hot and dry, the plant is almost confined to greenhouses. It is propagated by means of seeds and offsets, and succeeds best on rich, light, loamy soil.

Auric'ular Confes'sion. See CONFESSION; PENANCE; SACRAMENTS.

Au'rifa'ber, the Latinized name of JOHANN GOLDSCHMIDT, one of Luther's friends: b. 1519; d. Erfurt, 1579. He became pastor at Erfurt in 1566. He collected the unpublished manuscripts of Luther, and edited the 'Epistolæ' and the 'Table-Talk.'

Auri'ga, in astronomy, the Wagoner, a constellation of the northern hemisphere, containing as its chief luminary Capella, a star of the first magnitude.

Aurillac, ō're-yak', a town of France, 272 miles south of Paris. It is noted for its ancient buildings, among which are the Church of Notre Dame, constructed in the 13th century, and the castle of St. Stephen. It has manufactures of jewelry, copper, kettles, paper, woolen stuffs, and carpets. Pop. (1896) 13,531.

Au'rin, Au'rine, a trade name for impure rosolic acid.

Au'ringer, Obadiah Cyrus, American poet: b. Glens Falls, N. Y., 4 June 1849. He served for some years in the United States navy. In 1875 he became a farmer in his native place. Among his works are: 'Voices of a Shell,' 'Scythe and Sword' (1887); 'Episode of Jane McCrea'; and 'The Book of the Hills.'

Aurochs, ä'rŏks, the European bison (*Bos bonasus,* or *Bison europæus*) called by the Germans "wisent" and in the Slavonic languages "zubr" or "suber." This great bison stands six feet or more in height at the shoulder, and closely resembles the American bison or "buffalo" (q.v.); it is believed, indeed, that the American animal descended from the ancestral race of aurochs. When the Romans spread northward into Europe they found these and other oxen in the forests wherever they went, and even down to the days of Charlemagne they were spread over Germany and were beasts of chase. They have steadily diminished, however, until now they exist only as a single herd in the royal forest-preserves of Bielovege, in Lithuania, which in 1899 numbered 700, while a few hundred roam in the Caucasian Mountains. See BISON.

Aurora, Ill., city, Kane County; on Fox River, and on the Chicago, B. & Q., the Chicago & N. W., the Elgin, J. & E., and the Illinois, I. & M. R.R.'s. It was founded in 1834 by Joseph and Samuel McCarty; was organized as a village in 1857, and was incorporated as a city in 1887. It is an important manufacturing city, having a variety of extensive establishments; these include the shops of the Chicago, Burling-

ton & Quincy Railroad, cotton mills, a wheel-scraper manufactory, carriage and wagon factories, smelting-works, and foundries and machine shops. There are five national banks with a combined capital of $600,000, and a State bank. There are 38 churches, a good system of public schools including two high schools, the East Aurora High School and the West Aurora High School, the latter established in 1870; and a public library, a building for which was presented by Andrew Carnegie. It is also the seat of Aurora Business College and of the Jennings Seminary for young women. The government is vested in a mayor and a city council of 14, seven of which are elected each year for a term of two years; the city officials are elected by the people. The waterworks and the electric light plant are owned and operated by the city. Pop. (1890) 19,688; (1900) 24,147; (1904; estimated) 28,000.

Auro'ra, Ind., town in Dearborn County, on the Ohio River; C., C., C. & St. L., and the Ohio and Miss. R.R.'s. It has regular steamboat connection with Cincinnati. There are extensive car shops here, and a large grain and hay trade. Pop. (1900) 3,645.

Auro'ra, Mo., a city in Lawrence County, situated on the Kansas City, Fort Scott, and Memphis R.R.'s., about 18 miles northwest of Pierre City. The chief industries are fruit growing, lead and zinc mining, and farming. There are also flour mills, foundries, and machine shops. Aurora has two banks with $75,000 capital. Pop. (1900) 6,191.

Auro'ra, N. Y,. a village in Cayuga County, situated on Cayuga Lake; 25 miles northwest of Ithaca; on the Lehigh Valley R.R. It is the centre of an agricultural region, and is a residental town and excellent summer resort. It is the seat of Wells College for Women. Pop. (1900) about 1,000.

Auro'ra (Greek, *Ēōs*), in mythology, daughter of Hyperion and Theia, and sister of Helios and Selene. She is goddess of the dawn; rises from the ocean, drawn by the celestial horses, Lampus and Phæthon, and with rosy fingers raises the veil of night, shedding light upon the world.

Auro'ra, a famous painting by Guido Reni, on the ceiling of the Casino Rospigliosi in Rome.

Auro'ra Bo'rea'lis (French, *aurore boréale;* German, *Nordlicht*), the northern light. An illumination in the sky, seen oftenest north of middle latitudes in the northern hemisphere, and south of them in the southern hemisphere. In our hemisphere it is generally visible in the north, and has, therefore, been called the Aurora Borealis. In the southern hemisphere it is called the Aurora Australis.

The frequency with which it is seen varies with the latitude of the place. It is comparatively rare within 45° of the equator, but becomes more frequent toward the north up to the latitudes of about 60°, where it sometimes becomes almost a nightly occurrence. Nearer the pole it again becomes less frequent. We shall first describe it as it is commonly seen in our own latitudes. The first noticeable phenomena commonly occurs after the end of twilight, when the northern sky near the horizon will be seen illuminated with a light somewhat like that of the dawn. Careful examination will show, however, that the illumination is in the form of a broad arch, highest near the magnetic north, and reaching the horizon in the northeast and northwest directions. Presently beams of light are seen crossing this arch with a quivering or flickering motion, and shooting toward the zenith. Each beam constantly varies in brightness and seemingly fades away to give place to another.

In more northern latitudes, say north of 45° or 50°, these beams form the most brilliant feature of the aurora. Sometimes they are arranged in curved, wavy lines like the slats of a window shade flying in the wind, giving the appearance of a scroll in the process of being unrolled. In the case of a very brilliant aurora the beams may cover almost or quite the entire sky. In this case they will be seen to converge toward a point commonly not far from the zenith. The appearance presented by the beams grows out of the direction in which they are seen and to the laws of perspective. Long-repeated observations show that the rays are really parallel to the direction of the dipping needle, or to the lines of the earth's magnetic force. In the latitudes which we have mentioned, the dip is commonly more than 60°, increasing to 90° at the magnetic pole; hence when a great number of beams, all parallel to each other, are viewed from a point on the earth's surface under the region in which they are found, they all seem to converge according to the laws of perspective, toward that part of the sky to which the upper (south) pole of a dipping needle is directed. If the parallelism to the magnetic lines is exact, the direction of this point should be the same as that of the compass needle itself. It is still an open question where the parallelism is exact. Many observations seem to show a deviation of 10° or more, but the determination of the exact centre of convergence is difficult unless the rays are so numerous as to cover a large part of the sky, and it is not certain that the deviation may not be due to errors of estimation.

The Nature of the Auroral Light.—As a general, perhaps universal, rule, the rays or beams which we have described have a slightly yellowish tinge. When their light is analyzed with the spectroscope, several lines, sometimes as many as 12, are found in the spectrum. Of these the brightest and most constant is in the yellowish green part of the spectrum, having a wave length of 557. This line is characteristic of the aurora, but has not been identified with that emitted by any known substance.

The light of an aurora does not proceed wholly from the beams. Very irregular sheets of light, having the appearance of thin luminous clouds, are often seen. These are of various colors, red being especially frequent. The appearance is then that of a red cloud illuminated by the rays of the sun sometime after the latter has set. The light can, however be easily distinguished from that of a cloud by its diffused character and the absence of any definite outline. The height of the region in which the auroras are formed has never been definitely determined. The most important question is, whether the height is, in any case, above the upper limit of the atmosphere. This question is all the more difficult in that this limit is in itself an uncertain quantity. Observations of shooting

stars show that these objects become visible at a height of about 100 miles above the earth's surface. The limit of the atmosphere must therefore be as high as this, and may be much higher. The difficulty of making observations upon the same auroral beams, at one moment, at different points of the region from which they are visible, is such that no exact determination of the height of a beam has ever been made. There is some reason to believe that the height may range from 100 to 150 miles, but there is no reason to believe that a beam is ever seen above the possible limit of the atmosphere.

The lower limit of the aurora is undetermined. Observers have sometimes been supposed to see a beam between their own position and a mountain or other terrestrial object, but this was probably one of those optical illusions from which even the best observers can scarcely free themselves. It is also very frequently believed in countries where auroras are numerous that the phenomenon is accompanied by a crackling sound, somewhat resembling the rustling of silk or straw. As these sounds have been more difficult to hear, the more accurate and well-trained the ear of the observer, the presumption is that they are entirely illusory. It is a well-known psychological fact that when a phenomenon is seen which is commonly associated with sound, many people fancy that the latter is heard even in cases where it is manifestly impossible. A familiar instance of this sort is the rocket-like sound which many persons fancy to accompany the passage of a brilliant meteor through the air. Apart from the fact that such a sound could not possibly have come from the meteor, we have the fact that only untrained observers ever hear these sounds.

Cause of the Aurora.— Science has not been able to as yet determine with certainty and precision the cause of this very common phenomenon. When the luminous effect produced by the passage of electricity through the highly rarefied air of a vacuum tube was first observed, its resemblance to the aurora led to the view that the latter was produced by electric currents in the upper regions of the atmosphere. Although it is not impossible that such currents may be associated with the aurora, they do not adequately explain its light, and are apparently inadequate to explain its rays. Yet there is no doubt that the aurora is associated in some way with the magnetism of the earth. The coincidence of the rays of the aurora with the direction of the magnetic needle is one proof of this relation; another proof is found in the relation of the aurora to magnetic storms. The general rule is, that a very brilliant aurora is associated with such a storm, disturbing the magnetic needle not only at the point where the aurora is visible, but perhaps over the whole earth. Earth currents so strong that from time to time a line of telegraph may be run by them are also occasional accompaniments of a brilliant aurora, but although the intimate connection of the two phenomena is so well established, the exact relationship is yet to be worked out. In recent years Arrhenius has propounded a theory, based on the very probable fact that the sun emits a flood of corpuscles of a nature similar to that of the mysterious rays known as X-rays, cathode rays, electrons, etc., the investigation of which has occupied so large a place in recent physics. His theory is, that these corpuscles on approaching the earth are acted on in the direction of the lines of its magnetic force round which they describe helices. While nothing as yet has been found to disprove this theory, it is one which still needs much proving. What can be said with reasonable probability is that the aurora is caused by irregular emanations of corpuscles from the sun, which are stopped in the upper regions of our atmosphere.

Periodicity of the Aurora.— Records of auroras extending back two centuries or more show that they have been much more numerous at some period than at others. Sometimes it has been supposed that they have been more numerous at intervals of 33 or some fixed number of years, but this has not yet been proved, nor has any law been determined by which we can definitely say at what times they appear in the greatest number. But several periods are observed which show that the appearance of the aurora is in some way connected with the sun. The first instance of this is the fact that they are more numerous when the spots of the sun are more numerous. As there is an 11-year period in the spots on the sun, so there is a corresponding period in the aurora. There is also a semi-annual period in the frequency of the aurora, the greatest number being observed in March and September and the smallest in June and December. Arrhenius has connected this with the fact that in March and September the earth is over the region of the sun's surface in which spots are more numerous. Statistics also show that there are more auroras in the northern hemisphere when the moon is south of the equator than when she is north. This, however, is not proved to be a general law. There is also an observed period of 25.93 days in the frequency of the aurora. This is so near the time of the sun's rotation that it may be connected with the latter. Consult: Angot, 'The Aurora,' International Scientific Series.

SIMON NEWCOMB, LL.D.

Auro'ra Leigh, lē, a blank verse novel by Mrs. Browning, published 1857. The book discusses various theories for the regeneration of society, and is filled with passages of great beauty, and ethical utterances of a lofty nature.

Aurungzebe, â'rŭng-zēb', the last important emperor of Hindustan, of the Mogul dynasty: b. 22 Oct. 1618; d. Ahmednuggur, 21 Feb. 1707. He was the son of Shah Jehan, and properly named Mohammed, but received from his grandfather that of Aurungzebe (Ornament of the Throne), by which he is known to history. Aurungzebe, in 1658, was crowned sole monarch of the great Mogul empire.

Ausable (ō-sä'b'l) **Chasm,** a picturesque and popular American summer resort, in New York State; 12 miles from Plattsburg, and 1 mile from Keeseville. It is an isolated formation, wholly independent of, and disconnected from, any other similar panorama. At the beginning of the chasm, the river is hemmed into a channel not more than 10 feet wide by walls of rock from 100 to 200 feet high. Lower down the walls gradually spread apart till in some places there is a distance between them of 50 feet, and then extend with sharp turns and occasional enlargements for nearly 2 miles.

Lateral fissures, narrow, and deep, project from the main ravine at nearly right angles, and through one of these a staircase of over 200 feet reaches to the abyss. The walls are formed of laminæ of sandstone, laid in precise and regular order, and their crevices are filled with a thick growth of hardy pines and cedars. The trip through the chasm may be made in a small boat or on foot. For the accommodation of tourists, stone walks with substantial iron railings and firm bridges have been constructed.

Auscultation, a method of examining the body by means of the sounds given to the ear. The naked ear may be used, or instruments, such as the stethoscope (q.v.), or the phoneidoscope be employed. The natural sounds may be alone investigated, as in listening to the breathing sounds, or the heart sounds, or the organ, or that portion contiguous or remote from the organs, may be tapped, or percussed, to determine variations in the resonance. All of the parts of the body may be investigated by these means. Auscultation is probably, next to inspection, the oldest mode of investigation. Hippocrates II. used it extensively, but it was not until Lænnec, in 1816, gave his demonstrations that the method came to be recognized as one of the most important in the diagnosis of diseased conditions. Consult Butler, 'Diagnostics of Internal Medicine' (1901); Sahli, 'Untersuchungsmethoden.' See Percussion.

Auso'nia, a poetical synonym for Italy; so used by Virgil and other Roman poets.

Auso'nius Decimus Magnus, the most distinguished Roman poet of the 4th century A.D.: b. Burdigala (Bordeaux) about 310; d. about 392. He studied under several distinguished masters, and became at last professor of rhetoric in his native city, whence his fame extended through the whole empire. Valentinian intrusted to him the education of his son, Gratian, and appointed him afterward quæstor and prætorian prefect. After Gratian had ascended the throne he showed himself not less grateful to his preceptor. About the year 379 he appointed him consul in Gaul. After the death of Gratian, Ausonius lived upon an estate at Bordeaux, devoted to literary pursuits. As Valentinian was of the Christian religion, it is probable that Ausonius was so, too; and many of his writings confirm this conjecture. Critics are not unanimous on the subject of his poetical merits. He is undeniably learned and ingenious, but his style and versification have the blemishes of the age, and his Latin is impure. His epigrams, idyls, eclogues, letters in verse, etc., are extant. The best edition is that of 'Peiper' (1886).

Aus'pices, among the Romans, omens, especially those drawn from the flight or other movements of birds, supposed to be indications of the will of heaven, and to reveal futurity. At first only the augurs took the auspices, but after a time civil officers, discharging important functions had the right of doing so. Two kinds of auspices, however, arose — a greater and a lesser; the former reserved to dictators, consuls, censors, prætors, or the commander-in-chief in war; the latter permitted to less exalted functionaries. The glory of a successful enterprise was universally assigned to the person who took the auspices, and *not* to the leader of the enterprise itself; hence, the phrase arose, to carry on a war "under the auspices" of the emperor or some other high authority. See Augurs.

Aussig, ow'sĭg, a town in Bohemia, near the junction of the Bila with the Elbe; 42 miles north-northwest of Prague. It has large manufactures of woolens, chemicals, etc. Pop. (1901) 38,407.

Austen, Jane, English novelist: b. Steventon, Hampshire, 16 Dec. 1775; d. Winchester 18 July 1817. Miss Austen was the daughter of the Rev. George Austen, rector of Steventon and Deane, and Cassandra Leigh Austen, daughter of the Rev. Thomas Leigh and niece of Theophilus Leigh, for many years master of Balliol College, Oxford. Jane was the youngest of seven children, of whom others besides herself, particularly Admiral Francis William Austen, became distinguished. Until 1801 she lived at Steventon. Her life here was quiet, domestic, and moderately studious. Much of her spare time she spent in writing, chiefly for her own amusement. In 1801 the family removed to Bath, whence Miss Austen made visits to Lyme, Southampton, and other places in the south of England. Her father died in 1805, and in 1809 she settled at Chawton, in Hampshire, where she remained until within two months of her death. In May 1817, after some months of ailing health, she went to Winchester for treatment, and there died in the following July.

Miss Austen began writing stories at an early age, and before 16 is said to have composed good-humored nonsense. The first of her extant novels, 'Pride and Prejudice,' was written between October 1796 and August 1797. Before that she had written 'Eleanor and Marianne,' which, in 1797–98, she altered into the present 'Sense and Sensibility.' Her third novel, 'Northanger Abbey,' belongs to 1798. The first of these novels to be published was 'Sense and Sensibility,' in 1811. Two years later 'Pride and Prejudice,' which had been refused by a publisher in her father's lifetime, made its appearance. 'Northanger Abbey' had an even longer period of darkness; in 1803 it had been sold to a publisher for £10, but the publisher, after keeping it ten years or more, sold it back to the family, by whom it was issued in 1818, the year after the author's death. In 1804, Miss Austen began 'The Watsons,' but never finished it, and until 1811 apparently did comparatively little writing. Between that year and 1816, however, she wrote 'Mansfield Park,' 'Emma,' and 'Persuasion,' published respectively in 1814, 1816, and 1818. There is also an unfinished story, 'Lady Susan.'

The novels were not especially popular in the author's lifetime, though Scott and Macaulay (a little later) paid sincere and high tribute to their excellence. To-day they are regarded as among the best novels in the language and are probably as widely read as those of any first-rate woman novelist in English. The reason for their high place appears to lie in Miss Austen's skill as a story-teller and a drawer of character. The people she deals with are chiefly from the higher middle classes in the English country, and she rarely goes above or below them. In a time, that of the Napoleonic wars, when there was every temptation to write battle stories and heroics, Miss Austen kept her eye on the life

that she knew, and had nothing to do with spectacular means of arousing interest. The aspect of the few warriors and seamen who come into her pages is domestic rather than martial. Nor is there any very serious adventure of any sort; the worst that happens is an elopement, or when a heroine slips down stairs and is stunned. Her people are quite unintellectual and in no wise grand or heroic. On the whole, her material is less startling than that of any English novelist, but the picture which she gives is unsurpassed in the perfection of truth, humor, and vivacity. As a story-teller, she has, in point of technical construction, no superior. Her plots are not elaborate and there is no conspicuous wealth of invention; in all her six novels the plot turns on an elopement or a hidden engagement; but, granting this, the construction of 'Pride and Prejudice,' 'Emma,' and 'Mansfield Park' is not to be bettered. They are models of their class of story telling. As an artist in character drawing, Miss Austen has contributed to the gallery of familiar persons such figures as Miss Bates, Mr. Woodhouse, Mrs. Bennet, Mrs. Norris, and a number of others, all of whom are brilliant, though occasionally exaggerated, creations. All her important characters are strongly individual, and are so firmly drawn that there is no tendency to confuse them as types or as persons.

'Pride and Prejudice' is usually regarded as the best of the novels in point of liveliness of style, neatness of structure, and vigor of substance. This position would be disputed by admirers of the more intricate 'Emma' and the more intricate and gloomy 'Mansfield Park,' both of which probably surpass 'Pride and Prejudice' in maturity and variety of characterization. 'Northanger Abbey' is less ambitious than either of the preceding; it is a very vivacious burlesque, with a charming moral. The other two novels, 'Sense and Sensibility' and 'Persuasion,' are usually thought to be inferior.

Bibliography.— Excellent editions of the novels of Jane Austen are easily to be had. The principal life is the Rev. J. E. Austen Leigh's 'Memoir of Jane Austen.' There is also a life by Goldwin Smith in the 'Great Writers' series (1890). The place of Jane Austen in literature is treated in such literary histories as Mrs. Oliphant's 'Literary History of the 19th Century,' and W. L. Cross's 'The Development of the English Novel.' W. D. Howells, in 'The Heroines of English Novels' (1901) and 'Criticism and Fiction' (1891) pays very high tribute to Miss Austen as an artist and as a creator of character.

W. T. Brewster,
Professor of English in Columbia University.

Aus'ten, Peter Townsend, American chemist: b. Clifton, S. I., N. Y., 10 Sept. 1852, and educated at Columbia University, School of Mines, and in Germany and Switzerland. In 1876, he was appointed instructor of chemistry at Dartmouth; in 1877, professor of chemistry at Rutger's. From 1887 to 1893 he was engaged in industrial work, and 1893–8 was professor of chemistry at Brooklyn Polytechnic Institute. He has invented several useful manufacturing processes; has written a number of valuable papers, and translated Pinner's 'Repetitorium der Organischen Chemic' under the title 'An Introduction to the Study of Organic Chemistry.'

Austerlitz, ows'ter-lets, Moravia, a town on the Littawa, 13 miles southeast of Brünn. In the vicinity, on 2 Dec. 1805, was fought the famous battle between the French army of 80,000 men, commanded by Napoleon, and the combined Russian and Austrian armies, numbering 84,000, under their respective emperors; in which the former achieved a signal victory. According to Alison, the allies lost 30,000 in killed, wounded, and prisoners, and the French, 12,000. The battle was followed by an armistice, the terms of which were dictated by Napoleon; and immediately after, on 26 December, by the Treaty of Presburg, which disastrously affected Austria. The battle of Austerlitz is sometimes called "The Battle of the Three Emperors."

Aus'terlitz, The Sun of, a term given to any favorable omen, in allusion to the brilliant appearance of the sun just before the battle of Austerlitz, and which Napoleon accepted as a token of coming victory.

Aus'tin, Saint. See Augustine, Saint.

Aus'tin, Alfred, English poet, critic, and journalist: b. Headingly, near Leeds, 30 May 1835. He graduated from the University of London in 1853, was called to the bar in 1857, and was editor of the 'National Review,' (1883–93). In 1896 he was appointed poet laureate of England. He is the author of political books, novels, and many volumes of verse. The latter include 'The Season: a Satire' (1862); 'The Human Tragedy' (1862); 'The Golden Age: a Satire' (1871); 'The Tower of Babel,' a drama (1874); 'Savonarola,' a tragedy (1881); 'Veronica's Garden,' in prose and verse (1895). 'The Garden That I Love,' 'In Lamia's Winter Quarters,' 'Haunts of Ancient Peace' (1902), and 'A Lesson in Harmony' (1904), are delightful volumes of mingled prose and verse. Opinion is much divided as to his merits as a poet, particularly in such works as 'Fortunatus, the Pessimist' (1891). In December 1899, he published a war poem, 'To Arms!' and, in May 1900, one on the relief of Mafeking.

Aus'tin, George Lowell, American physician and writer: b. Massachusetts, 1849; d. 1893. Among his numerous works are 'Perils of American Women'; 'Water-Analysis' (1882); 'Under the Tide'; 'Life of Franz Schulbert'; 'Popular History of Massachusetts'; 'Life of Wendell Phillips' (1888).

Aus'tin, Henry, American lawyer and legal writer: b. Boston, Mass., 21 Dec. 1858. He has been a commissioner of insolvency for six years and is an associate justice of the municipal court of Boston (West Roxbury district). He is the author of 'American Farm and Game Laws'; 'American Fish and Game Laws'; 'Liquor Law in New England.'

Aus'tin, Jane (Goodwin), American novelist: b. Worcester, Mass., 25 Feb. 1831; d. Boston, 30 March 1894. Her works include 'Fairy Dreams' (1860); 'Moonfolk' (1874); 'Mrs. Beauchamp Brown' (1880); 'A Nameless Nobleman' (1881); 'The Desmond Hundred' (1882); 'Nantucket Scraps' (1882); 'Standish of Standish' (1889); 'Betty Alden' (1891); and 'David Alden's Daughter and Other Stories (1892).

From the Hollyer photograph after Linnel

JANE AUSTEN

Aus'tin, John, English writer on jurisprudence: b. Creeling Mill, Suffolk, 3 March 1790; d. Weybridge, 1 Dec. 1859. From 1826 to 1835 he filled the chair of jurisprudence at London University. He served on several royal commissions, one of which took him to Malta; lived for some years on the Continent, and finally settled at Weybridge in Surrey. His fame rests on his great works, 'The Province of Jurisprudence Determined,' published in 1832; and his 'Lectures on Jurisprudence,' published by his widow between 1861 and 1863. His wife, Sarah, one of the Taylors of Norwich: b. 1793; d. Weybridge, 8 Aug. 1867; produced translations of German works, and other books bearing on Germany or its literature; also 'Considerations on National Education,' etc.

Aus'tin, Jonathan Loring, secretary and treasurer of Massachusetts: b. Boston, 2 Jan. 1748; d. 10 May 1826. He remained two years in Paris as Dr. Franklin's secretary. He also spent two years in England as agent of Dr. Franklin. On his return in May 1779, he was liberally rewarded by Congress. In 1780, in his passage to Spain as agent of the State, he was taken and carried to England. He afterward held the offices of state secretary and treasurer in Massachusetts, and died universally respected. His son, James Trecothic: b. Boston, 7 Jan. 1784, studied law, rose in the profession, and was attorney-general of the State from 1832 to 1843.

Aus'tin, Moses, an American who obtained the first grant from the Mexican government for the formation of an American colony in Texas: b. Durham, Ct.; d. January 1821. He forwarded to the commandant-general at Monterey, an application for permission to colonize 300 families in some part of Texas. The application was successful, and the enterprise prosecuted by his son, Stephen F. Austin (q.v.).

Aus'tin, Oscar Phelps, American statistician, chief of the bureau of statistics, treasury department: b. Illinois. At the age of 12 he removed with his parents to Nebraska, where he remained until manhood. He then engaged in journalism until his appointment as chief of the bureau of statistics, 9 May 1898. He has since lived in Washington, serving as Washington correspondent for newspapers in New York, Chicago, and other cities. He is the author of 'Uncle Sam's Secrets'; 'Uncle Sam's Soldiers'; and other publications for the instruction of youth in national and international affairs; also of official monographs 'Commercial China in 1900'; 'Commercial Japan'; 'Commercial Africa'; 'Russia and the Trans-Siberian Railway'; 'American Commerce'; 'Commercial Alaska'; 'Submarine and Land Telegraphs of the World'; 'Colonies of the World and Their Government'; 'Colonial Administration'; etc. He is associate editor of the 'National Geographic Magazine.'

Aus'tin, Stephen Fuller, American pioneer: b. 1792; d. 27 Dec. 1836. He was a son of Moses Austin (q.v.), followed up the grant previously issued to his father. By it he was clothed with almost absolute power over the colonists, and only obliged to report to the captain-general. He founded what is now the city of Austin, the capital of Texas. The colony prospered, and, being accompanied by a considerable number of similar associations, promoted an influx of Americans to such an extent that they met 1 March 1833, without the concurrence of the Mexican population, in a convention to form a constitution for the as yet Mexican state of Texas. Austin was one of the delegates chosen to carry the result of their deliberations to the central government at Mexico, and obtain its ratification. The delays and frequent revolutions at Mexico leading him to despair of ever bringing his commission to a close, he addressed a letter, 2 Oct. 1833, to the municipality of Bexar, and through them to the people of Texas, recommending a union of all the municipalities to provide against the consequences of a probable refusal of their applications by organizing a state under the *Acta constitutiva* of 7 May 1824. This letter was considered treasonable, and Austin was arrested and held as a hostage for the good behavior of Texas. There he was detained until September 1835. He was appointed a commissioner to the United States in November 1835. This was before the Texan declaration of independence; and it was not till after his arrival at New Orleans, and the information of the union of Santa Anna with the federal party for the invasion of Texas, that he was brought to the point of recommending such a measure. He acted with prudence and patience, and was successful in preparing for the independence and annexation of the new republic. He is looked upon as one of the most eminent and honorable of the founders of Texan prosperity.

Aus'tin, William, American author: b. 1778; d. 1841; remembered for his striking and original tale, 'Peter Rugg, the Missing Man,' in effect a New England variant of the Wandering Jew legend.

Aus'tin, Minn., a city and county-seat of Mower County, situated on Red Cedar River, and on the Chicago G. W., and the Chicago, M. & St. P. R.R.'s. It is the centre of a fertile agricultural region, and has a large export trade, as well as a variety of manufacturing establishments, including a meat-packing factory, flour mills, cement works, railroad shops, brick works, creamery, etc. It is the seat of the Southern Minnesota Normal College, and has several fine public buildings, among them a Carnegie library. Austin was first settled in 1852. Pop. (1900) 5,474.

Aus'tin, Tex., the capital and county-seat of Travis County, on the Colorado River. It is 81 miles north-northeast of San Antonio by the International & G. N. R.R., 186 miles west by north of Houston, and 230 miles northwest of Galveston, by the same, and the Houston & T. C. R.R.; and on the Austin & N. W. R.R. It is beautifully situated about 40 feet above the river, which here flows through attractive scenery, is navigable for river steamers in the winter, and is spanned by two bridges. An immense dam, 1,275 feet long by 67 feet above bed rock, the twelfth longest in the world, was completed in 1892, for water supply and power; but was carried away by a flood 7 April 1900. During its existence it created a large and handsome sheet of water called Lake McDonald, a favorite resort for fishing, hunting, and health-seeking parties, and famous for having two international regattas on it, Stansbury of Australia winning the championship of the world. There

are manufactories of lumber and iron goods, flour and leather; and oil refineries. There is a very large export trade in agricultural produce and live stock, hides and wool, cotton and grain; it is also the wholesale supply centre for a great district in provisions, dry goods, drugs, agricultural implements, ranching supplies, etc. The city is well built with wide and well-shaded streets. The most prominent building is the capitol, one of the largest of such structures in the United States, built of granite at a cost of $3,500,000. There are also the main building of the State University, which accommodates the law and literary departments; State asylums for the insane, blind, and deaf-mutes, and for colored patients of these classes; the State Confederate Home; St. Edward's College; the Tillotson Institute for Colored Pupils; seminaries and academies, besides the public school system. The State land office and the county court-house are prominent buildings. The government is administered under the revised charter of 1901, is by mayor, biennially elected; a city council, chosen half by wards and half at large; and officials elected partly by the council and partly by popular vote. The city owns its own waterworks and electric plant. The settlement was first called Waterloo, but in 1837, after the Texan revolution, incorporated and re-named after Stephen F. Austin (q.v.), the county being likewise named from William B. Travis (q.v.), killed at the Alamo. It was made the capital in 1839, and remained such after the admission of Texas as a State. The first free school in the State was established here in 1871. Pop. (1900) 22,258.

Australasia, âs'trăl-ā'shĭa, a geographical term of loose application, but usually regarded as comprehending the continental island of Australia and an unascertained number of other islands, some of them very little known, lying between lon. 110° and 180° E., and stretching from Papua or New Guinea, the farthest northern island of the division, to lat. 50° S. Besides the great island of Australia, it thus includes Tasmania, New Zealand, the Loyalty Islands (New Caledonia, etc.), Norfolk Island, New Hebrides, Solomon Islands, New Ireland (Neu-Mecklenburg), New Britain (Neu-Pommern), Admiralty Islands, and New Guinea, besides numerous other islands and island groups. The island of Timor and those lying west of it, though coming within the general boundary above indicated, belong to the Eastern or Indian Archipelago, called also Malasia. Australasia is estimated to have an area of 3,740,000 English square miles, and a population of 6,400,000. It forms one of three portions into which some geographers have divided Oceania, the other two being Malasia and Polynesia. Consult A. R. Wallace, (Australasia.)

AUSTRALIA:
HISTORY AND MODERN DEVELOPMENT.

1. **Australia — Areas and Divisions.** Australia, the largest island in the world, is of continental dimensions, with an area of approximately 2,946,691 square miles. The smaller island, Tasmania, which is now included in the general term «Australia,» as well as in the federal Commonwealth, and has an expanse of 26,215 square miles, is 150 miles south of Australia. The total area of the federated states is thus 2,962,906 square miles. This does not include British New Guinea, a territory of about 90,540 square miles, which is practically under the direction of the Commonwealth. The area of the respective states is — Western Australia, 975,876 square miles; South Australia (including the Northern Territory, which is for all practical purposes part of the state), 903,690 square miles; Queensland, 668,497 square miles; New South Wales, 309,175 square miles; Victoria, 87,884 square miles; Tasmania, 26,215 square miles. With the exception of a small space in the northwest part of the Continent the whole of the land has been more or less explored and mapped and a fairly accurate idea may be formed of its physical features, though new facts are naturally frequently disclosed with the gradual advance of settlement over a sparsely populated country. (Pop. 31 Dec. 1905 — males, 2,135,728; females, 1,921,033; total. 4,056,761, exclusive of aborigines). The coastline of Australia is somewhat less than 8,000 miles. Its widest part from east to west is 2,400 miles, and its deepest from north to south nearly 2,000 miles. The configuration of the island in places is so irregular that the political terminology of some of the states is misleading. Victoria, for example, is more southerly than South Australia.

Geology.— The east coast of Australia is mostly rugged and rocky, and fringed with many islets. Part of the south coast is low and sandy, but on other portions are bold cliffs rising several hundred feet sheer from the sea. The north and west coasts are generally depressed and scenically uninteresting, with monotonous sandhills. The interior, so far as explored, is largely composed of rocky tracts and sandy plains with little or no surface water, though thousands of artesian bores have revealed the presence of underground currents, which fertilize the soil, and transform deserts into highly productive areas. The whole continent is an irregular plain with high ridges in the east, and a marked depression in the centre, in some parts beneath sea-level. The base of the table-land is granite, which appears on the surface on the southern and western sides. Silurian rocks are prominent in South Australia, where unmistakable marks of glacial action have recently been discovered. In the southeast and east the rocks are volcanic, Silurian, carbonaceous, and carboniferous; the coal deposits on the eastern and parts of the western coasts are extensive, and brown coal has been found in South Australia, but at too great depths to be profitably worked, at a long distance from the seaboard.

Minerals, etc.— West of the Dividing Range are extensive plains largely used for pastoral and for agricultural purposes. The comparatively dry and scrub, or saltbush-covered lands in the interior are in many cases richly mineralized, and succeeding years show that they deserve less and less their old designation of «desert.» On one of such «deserts» is situated the famous Broken Hill Silver mine in New South Wales, and on others the celebrated Coolgardie and Kalgoorlie gold mines in Western Australia. In various parts of Australia and Tasmania are found, often in payable quantities (besides the royal metals and coal), tin, as well as nearly all the minor minerals and precious stones; while on the northeastern, northwestern, and northern coasts are probably the most extensive and productive pearl-shelling waters known. It has been shown, too, that the monotonous and extensive mallee country everywhere yields profitable returns when farmed under mixed cultivation and grazing systems; while some varieties of the mallee itself contain water-yielding roots long used by the aborigines and capable of sustaining the life of lost travelers.

Mountains.— There is no active volcano in the Commonwealth but some craters show signs of only recent extinction and of intermittent previous eruptions. A mountain range varying from 100 to 200 miles in width outlines the eastern and southern border of the continent; and, broadly speaking, all the rivers of Southern Australia take their rise in this Great Dividing Range. The Australian Alps, in the southeast part of the Dividing Range, contain the highest mountain summits in Australia — Kosciusko (N.S.W.), 7,308 feet; Mount Bogong (Vic.), 6,508. These are the most elevated points on the Continent. In Queensland peaks in the Belenden Ker range rise to 5,400 feet, and in other parts of the state are several eminences of about 4,000 feet. In South Australia the loftiest range is the Flinders — Mounts Remarkable and Brown, 3,100 feet each; and the principal elevation in the Gawler range in the northwestern interior is about 2,000 feet. In western Australia Mount William (3,000 feet) in the Darling Range, and Ellen's Peak (3,420 feet), are the loftiest. Tasmania is very mountainous — highest peaks, Cradle Mountain 5,069 feet, and Ben Lomond 5,010 feet.

Rivers and Lakes.— The Australian «Father of Waters» is the river Murray, which with its chief tributary, the Darling, flows 2,400 miles before reaching the Southern Ocean on the South Australian coast, and with its Queensland extensions has in favorable seasons a length of about 3,000 miles navigable by small steamers. It is probable that under agreement between the riparian states (South Australia, Victoria, and New South Wales), the river will be locked to improve navigation, and also to provide water for irrigation. In the Northern Territory of

South Australia, as well as elsewhere, some of the rivers are of large volume, and are navigable for comparatively short distances. On the east coast are the Hunter, Clarence, Brisbane, Fitzroy, and Burdekin; on the west the Swan, Murchison, Gascoyne, Ashburton, and De Grey; on the north the Fitzroy, Victoria, Flinders, and Mitchell. A considerable river of the interior is Cooper's Creek, or the Barcoo, which falls into Lake Eyre, one of a group of lakes on the south side of the continent having no outlet, and, accordingly, salt. The principal of these are lakes Eyre, Torrens, and Gairdner, all of which vary in size and saltiness according to the season. Another large salt lake of little depth, Lake Amadeus, lies a little west of the centre of Australia. Various others of less magnitude are scattered over the interior.

Rainfall.— Speaking generally, wherever the land is elevated the rainfall is good. It varies from about 70 inches annually in the tropical zone to three or four inches or even less, in the arid interior regions, and in the southern part to about 40 inches. The fall diminishes in close relation to the decline in the elevation of the land, allowing for coastal influence in the south, and tropical or sub-tropical conditions in the north.

Climate.— The climate of Australia is generally temperate, and in summer hot and dry, especially in the southern and central parts, but very healthy. In the tropical portions heavy rains fall and in most of the coast districts there is a sufficiency of moisture, but in portions of the interior the heat and drought are sometimes extreme. The air is, however, so exhilarating that even 120° Fahr. of shade heat in Australia is less oppressive than 90° in London, Paris, or New York, and cases of sunstroke are rare. This dry-hot atmosphere is especially recommended by medical men as an essential for sanitoria for sufferers from lung disease, and among the artesian waters in some of the arid country are highly mineralized springs with valuable medicinal properties. The dangers of drought, too, are being largely reduced by the rapid extension of the artesian boring area. At Melbourne (Vic.) the mean temperature is about 57°; Sydney (N.S.W.), about 63; Adelaide (S.A.), 61; Perth (W.A.), 64; Brisbane (Q.), 68; and Port Darwin (N.T.), 82 (tropical); Hobart (Tas.), 55. In the mountainous and more temperate parts of Australia snow falls in winter (June, July, and August), and long remains unmelted on portions of the Great Dividing Range, as well as in Tasmania. Practically, however, at no time of the year is it possible to skate on ice in any division of the Commonwealth. Australia is essentially a warm country throughout, but the winters are keen and bracing.

Fauna (extinct).— The distinguishing features of the extinct fauna (of which most interesting discoveries have been made) are specially worthy of note. In the mammalian class the great majority are marsupials, though the dingo and the whale (non-marsupial) are also found in a fossil state. Fossil remains of birds, reptiles (such as crocodile monitor), turtles, and fishes, have also been unearthed, some in the banks of the rivers in the interior. This indicates that the ancient vertebrate fauna of Australia was very similar to what it is now. The preponderant type of mammal was marsupial. In most respects, however, the species and even the genera were different, and many (such as *diprotodon, nototherium,* and the giant kangaroo) were much larger animals and of a more generalized type than exist at present. One living type (a wombat) is precisely of the same specie as is found in a fossil condition. Regarding the probable cause of the destruction of the extinct animals, it is impossible to give a general statement applicable to such a wide-stretching country as Australia, any more than such a statement could be applied to other countries where there has been a wholesale disappearance of once numerous groups. Changes of climate or physical conditions rendering the country or district unsuitable for their maintenance; over-specialization in structure causing the types to be incapable of adapting themselves to changed conditions; not impossibly the ravages of infectious or parasitic diseases—all these have had their effect. As a probable explanation in the special case of the Lake Callabonna fossils (a remarkable discovery in South Australia) the following occurs in 'The Physical Features of Lake Callabonna and the Account of the Discovery' by Prof. Stirling (Director of the South Australian Museum), which was published in the 'Memoirs of the Royal Society': "The facts that the bones of individuals are often unbroken, close together and frequently in their proper relative positions—the attitude of many of the bodies and the character of the matrix in which they are imbedded—negative any theory that they have been carried thither by floods. The likelihood, rather, is that they met their death by being entombed in the effort to reach food and water. . . The accumulation of so many bodies in one locality points to the fact of their assemblage around one of the last remaining oases in the region of desiccation which succeeded an antecedent condition of plenteous rains and abundant waters." An identical explanation has been suggested by Daintree in his 'Notes on the Geology of the Colony of Queensland.' Among the extinct fauna the most remarkable of the mammals is the Diprotodon australis; size 10 to 11 feet in length, five and one-half to six feet in height. Of the birds, the most noteworthy is *Genyornis newtoni*, a large bird with bones as big and massive as the elephant-footed moa of New Zealand, and the *Aepyornis* of Madagascar. It stood about six and one-half feet high, but is remarkable mostly for its massiveness. The deposit of this treasure trove of natural history at Callabonna is large and valuable, but (so far as the ground has been explored) it does not equal the immense deposits in certain places of fossil mammals and reptiles in the United States of America. Still, only one area of limited extent in Lake Callabonna has been exploited. Owing to the superior resources of the United States, and the greater generosity displayed there in this direction, much more systematic search has been undertaken both in that country and in South America than in Australia; but the possibilities are cherished of further revelations of the highest importance in this branch of research in the Commonwealth.

Fauna (existing).—To the northwest of Australia between the Dutch-Javanese islands of Lombok and Bali runs the Lombok Strait, which

curiously marks a dividing line between the fauna and the flora of Asia and those of Australia. The channel is narrow, if very deep, and the Asiastic birds might easily fly across it in one direction, and the Australian in another. So might a natural growth of plants be encouraged by the agency of wind and feathered carriers of seed; but none of these things has happened to any extent; the individuality of the relative fauna and flora has been strongly preserved. A number of the birds in Australia, however, migrate from one part of the Commonwealth to others with the changes of the seasons, and some pass to and from the continent of Asia—e.g., the sandpiper or sharp-tailed stint, that each season comes from Siberia, a distance of 10,000 miles. As already indicated, the existing fauna does not differ widely (except in proportions) from the extinct; and the forms observed in some instances are exceedingly interesting, if not bizarre. The "Bunyip" of the aborigines' legends (a monster that lurked in certain rivers and creeks and swamps) has never yet been proved to be other than fabulous. Much speculation and some mystery, however, surround the occasionally recurring visitations of plagues of rats in the far-northerly country, and of mice in the more southerly or agricultural areas. At periods of several years the rodents suddenly appear in vast numbers, and as suddenly disappear after doing, in some cases, much damage. The locust or grass-hopper plague, which at one time was much feared, is now almost unknown. In a generalization, Australia may claim to be free from all animals that attack man, except in exceedingly rare instances when a large kangaroo may be brought to bay, and in frenzy of fear strive to defend itself almost invariably vainly. Introduced animals, such as the rabbit and the fox, the sparrow, the starling, and other old-world birds, as well as the snail, multiply literally by millions, and become a scourge to pastoralists, farmers, and gardeners. The imported dog running wild has sometimes been confused with the aboriginal dingo (*canis dingo*) (q.v.) or "warrigal" (native name), a predatory animal, the wolf of Australia, that has caused heavy losses among sheep and lambs, which he destroys in mere wantonness. The dingo never barks, but howls dismally in the bush at night. Kangaroos once abounded virtually all over Australia, and varied in size from the "old man" of six feet to the most minute specimens, including wallabies and kangaroo rats. The most interesting example is the tree kangaroo, discovered in Queensland about 100 years after and not far from the spot (Endeavour River), where the first kangaroo (*Macropus major*) was found by Captain Cook, the great navigator, in 1770. In particularly the southern and western parts of Australia is seen a small "native bear," that inhabits trees, and, in Tasmania, the "Tasmanian devil," (*sarcophilus ursinus*) fierce and (like the dingo) untamable, and the "Tasmanian tiger" (*Thylacinus cynocephalus*) are the principal examples of fauna. The numbers of these latter, like those of the kangaroos and the opossum, have been largely reduced through indiscriminate slaughter with the advance of settlement; but recent legislation for the protection of the kangaroo (the skin of which is valuable for export) has stayed the race toward destruction. The wombat (*Phascolomys*) is a curious, burrowing, land animal, resembling in some respects the platypus and kindred creatures; but the most extraordinary is the platypus itself (*ornithorhynchus anatinus*), an amphibious animal that forms a connecting link between the mammals, birds, and reptiles. Of the birds the emu (*Dromaius novæ hollandiæ*) is from five to six feet high, and ranks next to the African ostrich, which it resembles in its habits; its numbers, as with the kangaroo, have been greatly reduced as settlement has progressed. The cassowary (*Casuarius australis*) is small, and not nearly so widely diffused as the emu; and the native companion or Australian Crane (*Grus australasianus*) is still slightly smaller than the cassowary, and an exceedingly graceful bird of somewhat eccentric habit. The black swan (*Cygnus atratus*) is scarcely so large as the white swan of the northern hemisphere, but is a beautiful bird. Strange in its habits is the satin bower bird (*Ptilonorhynchus holosericeus*) that forms for itself a playground or bower in which it sports with a miscellaneous collection of bright objects. Altogether about 750 species of birds have been found, mostly in Northeast Australia (which has been chiefly explored), but some of them are gradually becoming extinct. The old idea that Australian birds are songless is only relatively true. The flute-like note of the magpie or shrike is one of the most mellifluously melodious sounds in nature, and has been declared to surpass that of the nightingale. The reptiles are numerous. The largest of the snakes is the carpet snake (*Morelia variegata*), non-venomous, with an average length of about seven or eight feet, but with authenticated specimens up to 15 feet and even more; its habits are generally similar to the python's. Of the five principal poisonous reptiles the most deadly is the death adder (about three feet). Not more than 12 or 15 fatal cases of snakebite occur annually throughout Australia, but this comparative immunity is due partly to the prompt application of effective remedies. The white ant is common in the northern part of the Commonwealth, and is very destructive to wooden buildings in the early stages of settlement; its nests of mud and clay, generally with angles pointing north and south, range from 20 feet in height downward. The seas abound in numerous varieties of fish. In the period of pioneer settlement the Australian whaling grounds were very productive, and still are occasionally exploited with profit. Sharks are exceedingly numerous. The largest, the white pointer or white shark, (*Carcharodon rondeletii*) to the length of 16 feet and over has been caught, and attended by the pilot fish (*Naucrates ductar*) it preys upon man as well as upon denizens of the deep. Deaths through sharks are rarer even than those from snakebite, but this is to a large extent due to the precautions taken in bathing in the seas. The crocodiles or alligators, as they are popularly called (*Crocodilus Porcatus and Phyllas johnsonii*—a small variety), are plentiful in the tropical and sub-tropical zone on the northeast, northwest, and north coasts, they vary from about 20 feet (an unusual length) to five or six feet. In common with the shark the larger alligator sometimes attacks human beings, but the aborigines evidently stand in little fear of it. In the warmer waters is found the dugong (*Halicora australis*), from whose habits and

structure doubtless originated the fables concerning the mermaid. Seals are still seen on the remote parts of the coast and the southern islands. The most noteworthy is the sea bear (*Otaria cinerea*) from about seven feet in length, that are more prized for their oil than for their skins. In the northern waters turtles, the edible green (*Chelone Mydas*), and the shell-yielding hawkbill (*Chelone imbricata*) varieties are very numerous, and attain to a large size. The trepang or beche-de-mer is found, with the mother-of-pearl oyster—large (*Meleagrina margaritfera*) and small (*Meleagrina radiata*). The former frequently yield fine pearls, some single specimens of which have been sold for thousands, and many for hundreds of pounds. The edible rock oyster is widely represented, and the mangrove tree-climbing fish (*periophthalmus*) abounds, particularly in the northern waters.

Flora.— In a concise description the Australian flora may be said to possess peculiarities which distinguish it unmistakably. Many of its most striking features bear a natural relation to the general dryness and greatly differing conditions of the climate, owing to the vast area of the Commonwealth. The trees and bushes have mostly a scanty foliage, with little surface for evaporation, or thick leathery leaves well fitted to retain moisture. Nearly all are evergreen, but the effect upon the landscape is rather monotonous. The most extensively spread types of vegetation are the various kinds of gumtree (*Eucalyptus*), the shea-oak (*Casuarina*), the acacia or wattle, the grass tree (*Xanthorrhœa,* many varieties of the *Proteaceæ,* a few baobab trees, and very many ferns and tree-ferns. Of the gumtree there are more than 150 species, nearly all valuable for timber, and for their essential oils, which possess important medicinal properties. The wattle or acacia includes about 300 species, some of which also yield good timber or bark for tanning. The most beautiful, the most fragrant, and the most useful in these latter respects is the golden wattle (*Acacia dealbata*). Palms (of which there are at least 24 species, all, except the cocoa-palm, peculiar to Australia) are mostly confined to the northern and eastern coasts. The mallee scrub is formed by a dwarf eucalyptus, and the mulga scrub by a thorny acacia. A plant which covers large areas in the arid regions is the spinifex or porcupine grass (coarse and spiny), which renders traveling difficult, and is uneatable by any animal. Other expansive tracts are occupied by useful herbs and fodder bushes. Foremost among those stands the salt-bush (*Atriplex mummularia,* order *Chenopodiaceæ*), an exceedingly hardy plant, upon which the sheep and other animals thrive, and which has strong drought-resisting powers. Beautiful flowering plants, especially in Western Australia, are almost innumerable. Australia also possesses many turf-forming grasses, particularly the kangaroo grass (*Anthistiria australis*), which survives in even a protracted rainless period. The native fruits, including the native cherry (*Exocarpus cupressiformis*), the nut of which grows partially outside of the fruit proper, are few and of little practical worth, and the plants yielding roots used as food are not of much economic value; but exotic fruits and vegetables grow everywhere in unstinted abundance, and some of the cherished garden blooms of the older countries flourish so riotously as to become a pest in Australia. The vine and the olive thrive better than in the country of their origin, and enormous quantities of wine and oil are produced and exported. The cereals of Europe and maize are extensively cultivated, and large tracts of country, particularly in Queensland, are under the sugar cane, the pineapple, the cocoanut and other tropical exotics.

William John Sowden,
Editor of South Australian 'Register.'

2. Australia—The Aborigines. The aborigines of Australia are fast dying out — slain by civilization through interference with the game that they formerly hunted and lived on, added to the influence of the white man's diseases and vices. It has always been impossible to number the aborigines with any certainty on

account of the immense territory over which they were scattered, and of the nomadic habits of the people — habits which quite unfitted them for any sustained industrial work; but, according to the most trustworthy estimates which can be obtained, only about 150,000 of the blacks (including half-castes) now remain upon a territory of nearly 3,000,000 square miles. Certainly this is nearly four times the number of Maories who are left in New Zealand, but the territorial and other conditions are so essentially different in the two countries that comparisons are practically valueless. It is assumed that the representatives of the Australian aborigines are distributed in these proportions in the respective states: Western Australia, 70,000; South Australia (including the Northern Territory), 50,000; Queensland, 25,000; New South Wales, 6,828, and a few hundreds divided between Victoria and Tasmania. In Tasmania the last pure bred aborigine died in 1877; but 157 half-castes remain. Even on the Australian continent the sight of a full-blooded black near to a centre of settlement is very rare; and probably during the next 20 years the few survivors of the original owners of the soil will be found in only the remote districts. Already there is a striking disparity between the number of the natives as shown relatively in the estimates and the actual official records. The latest census gave these figures (which included half-castes as well as full-bloods in the cases of New South Wales and Western Australia): New South Wales, 4,287; Queensland, 6,670; South Australia, 3,888; Tasmania (half-castes only), 157; Victoria, 652; Western Australia (settled districts only), 5,261; total, 20,915.

Treatment of the Aborigines.—Although the racial antipathies and collisions due to the seizure by superior races of the lands of inferior peoples have been at least as marked in Australia as elsewhere, and although the treatment of the aborigines by many of the pioneer settlers did not err on the side of scrupulous humaneness, the governments, as such, have done a good deal to mitigate the sufferings of the unfortunate people, the dealing with whom was more difficult than it would have been if the vast majority of them had not in hopeless indolence always manifested an unconquerable repugnance to systematic labor or anything like sustained industry. The policy shown towards them might well have reflected — and in some cases it has done so — the fact that the conquest of the natives in Australia has been exceedingly easy owing to their utterly disorganized condition and their almost complete helplessness. These defects were in contrast to the valor, the country-love, and the mental alertness of the colored inhabitants whom the early white settlers found in New Zealand. As a rule the Australian aborigine — while in good districts physically stalwart and strong — was not of a ferocious or blood-thirstily aggressive nature; and in most cases when numbers of them have attacked a few isolated European settlers or travelers, the cause has been either a lack of firmness or judicious care on the part of the persons molested, or else revenge for wrongs inflicted upon the natives by other white men, mostly in the shape of interference with the black women, or by way of reprisals for the killing of cattle, the intrusion of which upon their former hunting grounds the blacks naturally connected with the gradual disappearance of the indigenous game.

All the state governments have enacted, and so far as possible enforced, laws for the protection of the blacks — laws in some instances providing for them special reserves within which the Europeans must not kill game or depasture stock; prohibiting the supply of intoxicating liquor or opium to the aborigines, and defending them against anything like enslavement or other ill-usage. During many years past at least a yearly — and in bad seasons a more frequent — distribution of flour, tobacco, blankets, and other useful articles has been made by the governments among the natives; and the state-aided efforts have been liberally supplemented by the benefactions of private persons and philanthropic institutions, especially in relation to education, spiritual and otherwise by missionaries who have established aboriginal stations. In the latest year for which statistics are available the purely governmental expenditure amounted annually (with allowances for endowed lands) to £20,000 in New South Wales, £9,000 in Queensland, £5,000 in South Australia, £5,000 in Victoria, and £12,000 in Western Australia.

Origin and Characteristics.—The origin of the aboriginal tribes of Australia has been a theme of much controversy; and the space available here is not adequate for even an enumeration of the many theories — including one comprehending an invasion by representatives of the Lost Tribes of Israel — advanced by various differing authorities. This seems to be a problem insoluble. In such circumstances sufficient must be the statement that there is a fair consensus of opinion to the effect that the native black races, as they were found by the European pioneers, had apparently been substantially affected (especially in the northern areas, which were for many centuries visited periodically by Malay proahs in search of pearl shell, trepang, and other products) by strains of blood introduced from beyond the island continent. A judicious balance of the evidence adduced by the most trustworthy ethnographers tends to the conclusion that the two points whence Australia benefited or otherwise by migration of fauna and flora, as well as ethnologically, were the group culminating in New Guinea on the one hand, and on the other in the chain of islands and peninsulas touching Australia on the Northwest. Certain plants and animals came from Asia to Australia, and it is held to be extremely probable that the ancestors of the Australian native tribes (who differ somewhat from those of Tasmania) crossed over to Australia from those two points. The native population is declared to be an admixture of at least two distinct elements. The skin of the one was a true yellow, and that of the other was a velvety black. The hair varies from straight to woolly, and the face and skull also have material dissimilarities. The nose assumes various grades, from the flat negro to the arched Jewish, and these contrasted types are believed to be due to the immigration of Malays and Papuans as indicated.

One reason why the black had no means of sea navigation was that "the negroid blood in his veins fetters the Australian so firmly to the

soil;» and another was that unkindly nature made the pressure of food requirements so heavy that the black was forced to be a wanderer, and had little time for anything else than the sustaining of bare life. As, however, this judgment reflects disparagingly upon the natural resources of the land, it is important to add that on their advent Australia's «Pilgrim Fathers» surprised the black inhabitants in a state of the most primitive savagery. There was not anywhere the remotest sign of any cultivation of the soil, or of the slightest attempt at tillage, or the thrift or providence which stores food for emergencies. Neither had the natives made—though they possessed roughly hewn bark or log canoes—any effort to clothe themselves, or—apart from miserable hovels constructed of rank grass or reeds, or boughs or bark of trees—to provide shelter from the cold of winter or the heat of summer. They had no written language, unless one may include in that characterization such crudely artistic representations as were inscribed on rocks or in caverns. Some of these, like the message sticks sent from one part of the country to another, are ideagraphic—or picture-writing — but none was at any rate unmistakably idealistic. Though most of the tribes paid deference to their «medicine men» or sages — mostly the older members of the tribal camps, who were always well treated by the younger blacks — they possessed practically no conception of abstractions. In this respect they were, while less provident than the ants, essentially untutored children of Nature — almost as much so as the dogs and the lower animals. They were endowed with instinct rather than with intuition. No bloodhound ever displayed keener sight or scent than the Australian blacktrackers, whose power in following a trail seems almost miraculous.

On the other hand, a close study of the aborigines reveals curious anomalies. Speaking generally the natives rise and fall in mental and physical superiority in exact harmony with the fertility or otherwise of the territory over which they roamed. Some of them had scarcely reached the low stage of intelligence associated with the stone age, others rapidly acquired education under European teachers, and in the wilds had constructed the boomerang which, with its marvellous power of returning to the thrower, has long puzzled even the most profound scientific experimenters. Among the highest-class natives, too, the character of their spears and other weapons indicated the possession of no little constructive skill, as well as undoubted patience and perseverance on the part of the makers. Where an aboriginal population is divided into hundreds, and probably thousands, of tribes, all mutually independent and mutually hostile, and distinguished usually by arbitrarily marked rings of exclusiveness, and each tribe speaking a dialect of its own, it is impossible to write with exactitude concerning their customs. One must not, therefore, attempt to explain why the tribal boundaries should in some cases be defined by geometrical devices; why in tribal territories here and there circumcision should be practiced, and on adjoining areas not observed; why some natives should exchange salutes similar to Masonic signs, and others be unaware of the meaning of this interchange, but be familiar with a somewhat intricate code of smoke signals; why some should be cannibals and others should not be; why the superstitious ceremonies should vary so widely; and yet why the main idea of the native «corroboree» or dance should be apparently almost everywhere the same or closely similar.

What seems to be certain is that the wild aborigines have no religion properly so called—no impelling attraction towards or trust in a God of Love, but a wholesome fear of «Mooldarbie» or the devil, whom all tribes sedulously seek to propitiate — some even by periodical human sacrifices, and the dread of whom as a spirit walking in the darkness keeps them shrinking in their camps until the break of day. Very extensively diffused also is the belief that nobody can die a natural death, but must be the victim of a maleficent influence or the evil eye. Equally widespread is the aspiration among the aborigines that after death they may «jump up a white fellow» — a notion said, perhaps fancifully, to have originated in the general custom of smoking the corpses of the dead, with the result that the peeling outer cuticle revealed the white dermis or true skin. Some tribes are prudishly modest in their relations with their women others are as flagrantly immoral. The language of some seems to be little better than mere gibberish, while concerning that of others one of the Jesuit missionaries has written that in its construction it is most ingenious, and curious in its form, indicating high intelligence and suggestive of the Hebrew. Many of the natives are musical, but their musical instruments are of the crudest character, made chiefly of hollowed wood, or grasses, or bamboos. At the age of puberty youths of both sexes are formally initiated by peculiar, jealously preserved, and often indescribable ceremonies, into the respective secrets of manhood and womanhood, but even the old men and women of the tribes who perform these rites — which include the knocking out of some of the young men's teeth and certain genital mutilations — seem to have no clear and coherent idea of their import.

3. Australia—Discovery and Early History. The discovery and the early history of Australia have been the themes of much discussion, but one conclusion admitted by all disputants is that the really pioneer navigation which resulted in the finding of the great island continent of the Southern Seas was not conducted by the British who now occupy the territory that was originally called Terra Incognita, and then New Holland. British enterprise, however, built a structure of colonization upon the site disclosed by the investigations of the people of other nations; and nearly all the

definite surveying of the Australasian seas has been done by the sailors of Britain.

The later days of the time in which Australia was still unknown were the days when the Portuguese, the Spaniards, and the Dutch roamed the oceans as intrepid searchers for new sensations rather than in the hope of territorial aggrandisement. Though anything like the exact year in which Australia was first sighted is doubtful, records show that between 1531 and 1542 the Portuguese declared the existence of a land which they styled "Great Java," and which corresponded with the northern parts of what is now the Australian Commonwealth. The most authentic available data indicate that the first European who saw the land was a Portuguese named Manoel Godhino de Eredia, who sighted it in 1601. By common consent, however, it has been conceded, as a starting point for Australian history, that Luis Vaez de Torres, who had been second in command of the De Quiros (Spanish) expedition, saw and sailed close to the Australian coastline in 1606; and that he was navigating in the neighborhood of New Guinea to the east of Cape York Peninsula at about the same time when a Dutch mariner was similarly engaged to the west of the Peninsula. Yet centuries elapsed before any attempt was made to settle the newly found continent, though meanwhile it was more than once passed and even circumnavigated. After 1619, when the Dutch expedition under de Houtmann anchored off the Abrolhos Reef on Northwest Australia, that part of the continent was repeatedly visited during the former half of the 17th century, and well verified history shows that in 1656 a Dutch ship was wrecked in the vicinity of the Abrolhos Group—fragments of the cargo are even now washed up occasionally by the sea or found in the guano deposits. Towards the end of 1642 Abel Jansen Tasman, a Dutch navigator, discovered and landed on Tasmania, and named it Van Diemen's Land (a title which it continued to bear until 1854). In 1688, William Dampier, a freebooter, was the first Englishman to set foot on Australia—at King Sound on the northwest coast. This same Dampier on a subsequent voyage took Alexander Selkirk (Defoe's "Robinson Crusoe) off the island of Juan Fernandez, on which the man had disembarked some time before. Still, curiously enough, Australia was not annexed on behalf of any nation until the last third of the 18th century. In 1768 Lieut. James Cook set out from England in a crazy ship, the Endeavour, in charge of an expedition appointed to observe at Tahiti the transit of Venus. Steering thence westward, he made an examination of New Zealand, came on 19 April 1770, upon the east coast of Australia, and anchored in Botany Bay. Later he proceeded northerly along the coast; and, after the Endeavour had in June struck upon a coral reef and well-nigh foundered near to the present Queensland port of Cairns, he continued his journey until on 21 August 1770, he hoisted the colors of England on the north Australian peninsula of Cape York, and thus formally took possession of the whole eastern part of Australia.

But settlers did not follow closely upon the heels of the navigators, and 18 years had passed before, on 18 Jan. 1788, a British convict expedition with 1,030 persons, of whom 750 were under penal servitude and banishment, reached Botany Bay. On 26 Jan. (now celebrated as Australian Foundation Day) the expedition landed, displayed its national colors with due pomp and circumstance, and so inaugurated European settlement in the "Great Land of the Southern Cross," which was, however, even thus late imperfectly known even in outline, and was comprehended under the general title of New South Wales, now applied to one of the territorially smallest states of Australia. With the occupation of the country further exploration by land and by sea proceeded apace. In 1798 Dr. Bass and Captain Flinders (who afterwards achieved immortal renown as a great navigator in association with Sir John Franklin, the Arctic hero) demonstrated by sailing round Tasmania that that country was veritably an island, and not a portion of the Australian Continent, as had been supposed. In 1802, having been provided by the British Admiralty with a scarcely seaworthy vessel, the Investigator, Captain Flinders surveyed the larger part of the southern coast of Australia, from west to east, and forestalled a French expedition which had been sent out under Captain Baudin in the ship *Le Geographe,* for purposes similar to those Flinders had in view.

The course of further marine exploration need not be further pursued; for the initial work had been accomplished. In 1803 the first colonization settlement was begun in Van Diemen's Land (Tasmania). In 1804 an unsuccessful attempt was made by Colonel David Collins, first governor of Tasmania, to found another convict colony in the now prosperous state of Victoria, which, however, from that time remained for 30 years with only one white man in it—a deserted convict named William Buckley, who dwelt among the aborigines until the year 1834, when real occupation was started, 10 years subsequently to the founding of Queensland, five years after that of Western Australia, and two years before that of South Australia.

During all the intervening time the exploration of the interior of the continent, mainly from Sydney, had been steadily progressing. First the disclosing of a means of passing beyond the Blue Mountains in 1813 showed (by Blaxland) a way out of what had been regarded as an impasse preventing access from the coastal fringe to the expansive interior territories which represented the Mystery Land of the early colonists. In 1824 Hume discovered the Upper Murray, the head of the great Australian Mississippi. Following the course of that river in 1828, Captain Charles Sturt added to the geographics of the period the name of its tributary, the Darling; and in 1830 he made, with almost sensational intrepedity, a journey down the Murray to its junction with the sea not far from Adelaide (the present capital of South Australia). In many directions other explorers were contemporaneously (and subsequently) causing the wilderness of the Terra Incognita of the Portuguese to yield up its secrets but only two of the dauntless explorers who have laid mankind under obligation to them for all generations need be particularly mentioned here. One of these was Ludwig Leichhardt, who started out from the east in

1848, and (with all the members of his party) apparently disappeared mysteriously and absolutely from the face of the earth; for no sign or trace of the expedition has ever since been seen or heard of. The other was John McDouall Stuart, who, after having been repeatedly baffled, succeeded at last in crossing the continent from south to north, and on 24 July 1862, laved his hands in the waters of the Indian Ocean, and hoisted the British flag on the northern shores of Australia. And now in this year of 1906 practically all the blank spaces in the Commonwealth may have been filled in by the cartographer, and Australia has no further laurels of fame to offer as worthy guerdons to brave and daring explorers by land or by sea.

4. Australia — Political History. *Beginnings of Colonial Self-Government.*— It was a maxim of the common law that, if an uninhabited country were discovered and peopled by British subjects, they were supposed to possess themselve of it for the benefit of their sovereign, and that such of the laws of England as were applicable and necessary to their situation and the conditions of an infant colony were immediately in force; that wherever an Englishman went he carried with him as much of English law and liberty as the nature of his circumstances required. It was recognized that Englishmen carried their political birthright with them over the broad surface of the earth; that the charters of freedom for which their ancestors fought were not left behind, but accompanied them to their new homes beyond the seas.

The Colonial Legislatures of Newfoundland and Jamaica were established not by British statutes, but by Royal Commissions under the Great Seal accompanied by Royal instructions. Local self-government in Australia did not, however, originate in the exercise of the prerogatives of the Crown, as it did in the case of some of the early North American and West Indian colonies. From the very first it was founded upon, as it was subsequently developed and built up, by statutory authority.

NEW SOUTH WALES THE FIRST ORIGINAL COLONY.

Foundation.—In 1784 the British Parliament passed the statute of 24 Geo. III., c. 56, intituled «An Act for the effectual transportation of felons and other offenders, and to authorize the removal of prisoners in certain cases, and for other purposes therein mentioned.» This law empowered the King, with the advice of the Privy Council, to appoint places to which felons might be transferred. By an order in Council bearing date 6 Dec. 1786, His Majesty's «territory of New South Wales, situated on the east part of New Holland,» was appointed a place for the reception of persons within the meaning of the Act.

By letters-patent and commission dated 2 April 1787, Captain Arthur Phillip was appointed Governor of the territory. The limits of his authority extended from Cape York on the north to the southern extremity of the coast of the continent and inland and westward as far as the 135th meridian, which was afterward extended to the 129th meridian east longtitude. The Governor was empowered to make orders for the good government of the settlement.

By the Act 27 Geo. III., c. 2, the King was authorized to establish a Court of Criminal Jurisdiction on the eastern coast of New South Wales. Such was the legal authority under which, on 26 Jan. 1788, a penal settlement was established at Sydney Cove. It was not at first intended to be a colony, or plantation, for the purposes of trade and cultivation, within the ordinary meaning of those terms.

The First Constitutional Charter.—The temporary Act 4 Geo. IV., c. 96. (1823), which became law during the governorship of Sir Thomas Brisbane, was the first legislation passed by the Imperial Parliament conferring anything like the rudiments of local self-government on the New South Wales community. A council of five persons was appointed having limited legislative powers. On 17 May 1824, a Charter of Justice, creating a Supreme Court was promulgated.

The Second Constitutional Charter.— The Act 9 Geo. IV., c. 83 (25 July 1828), passed during the governorship of Lieutenant-General Sir Ralph Darling, was the second Constitutional Charter of Australia. Courts of Criminal and Civil Jurisdiction, coupled with trial by jury, were organized. The laws and statutes in force within the realm of England, so far as applicable, were applied to the administration of justice in New South Wales and Van Diemen's Land. The Crown was authorized to constitute in New South Wales and Van Diemen's Land respectively, an Advisory Council to consist of such persons resident in the said colonies respectively, not exceeding 15, and not less than 10, as the King might be pleased to nominate.

The Third Constitutional Charter.—The third charter regulating the government of New South Wales was the Act 5 and 6 Vic., c. 76 (30 July 1842), passed during the governorship of Sir George Gipps. This Act established for the first time in Australia a legislature, partly, but not wholly, representative in its character. It enacted that, there should be within the colony of New South Wales a Legislative Council consisting of 36 members, 12 of whom were to be appointed by the Crown, and 24 were to be elected by the inhabitants of the colony having certain property qualifications.

The Governor, with the advice of the Council, was authorized to make laws for the peace, welfare and good government of the colony, provided that such laws were not repugnant to the laws of England; nor were they to interfere with the sale or occupation of the waste lands of the Crown. Bills imposing duties of customs had to be reserved for the Queen's assent. This Act did not grant to New South Wales the system known as "Responsible Government." The Governor presided over and managed all the public departments. It contained, however, the feeble germs whence has since sprung the splendid fabric of parliamentary institutions in Australia. It was the first concession made by enlightened British statesmen to the growing wealth and importance of the Australian colonies.

The new Council was opened by Sir George Gipps on 1 Aug. 1843.

The Fourth Constitutional Charter.—The next important charter granted to Australia was 13 and 14 Vic., c. 59 (5 Aug. 1850, intituled "An Act for the better government of Her Majesty's Australian Colonies," and commonly known as the Australian Colonies Government Act. The bill, of which this Act was the outcome, was first introduced into the House of Commons in June 1849. The two main objects of the Act were the separation of the Port Phillip District from New South Wales, and the establishment in all the colonies of an improved system of Provincial Government. The Legislative Council, erected in New South Wales by the Act of 1842, was not materially disturbed. Its powers were in some respects increased, and the franchise on which its representative members were elected was liberalized.

The New Constitution.—A new election of members of the Legislative Council of New South Wales on the liberalized franchise then took place. The new Council complained that the Act 13 and 14 Vic., c. 59, did not place the control of revenue taxation, and the waste lands of the Crown in the Colonial Legislature, and a full measure of local self-government in a Constitution similar in outline to that of Canada was applied for.

In 1852 gold was discovered in New South Wales and Victoria, which caused a great influx of immigrants into these colonies. In a despatch addressed to Governor Fitzroy, dated 15 Dec. 1852, Sir John Packington, Secretary of State for the Colonies, stated that Her Majesty's government had been greatly influenced by considerations arising from the extraordinary discoveries of gold in the Australian colonies, which had imparted new and unforeseen features to their political and social positions. It was the wish, therefore, of Her Majesty's Government that there should be established in each colony, a new Legislature consisting of a Legislative Council nominated by the Crown, and an elective House chosen by qualified inhabitants. To such Legislatures it was proposed to give general powers including that of dealing with the waste lands of the Crown.

Upon the receipt of this despatch the Legislative Council of New South Wales, under the authority conferred by 13 and 14 Vic., c. 59, s. 32, appointed a select committee to draw up a constitution establishing a bicameral Legislature, having increased powers and functions. A constitution was accordingly drawn up. It provided that, in place of the Legislative Council then existing there should be a Legislative Council and a Legislative Assembly, and that Her Majesty should have power by and with the advice and consent of the said Council and Assembly to make laws for the "peace, welfare, and good government of the said colony in all cases whatsoever." The members of the Council were to be nominated by the Governor with the advice of the Executive Council. The first nominees were to hold their seats for five years only. The members of the Assembly were to be chosen by male electors having certain residential and property qualifications. An Assembly once constituted was to continue for five years unless dissolved by the Governor. The new Legislature was endowed with full power to deal with the waste lands of the Crown and to impose duties of customs.

On 21 Dec. 1853, the new Constitution was adopted and transmitted to the Secretary of State for the Colonies. In an amended shape it was made a schedule to a bill introduced into the Imperial Parliament, intituled "A Bill to enable Her Majesty to assent to a bill as amended by the Legislature of New South Wales to confer a Constitution on New South Wales." The bill was passed by Parliament and received the Royal assent on 16 July 1855. Its number is 18 and 19 Vic., c. 54. The Act conferring a Constitution on Victoria was assented to on the same day. The Constitutions were then transmitted to the respective Colonies, accompanied by explanatory despatches from the Secretary of State, Lord John Russell, in which the Governors were instructed as to the introduction of responsible government.

Responsible Government.—That great change in the colonial system of administration known as "The Introduction of Responsible Government"—that is of Ministers appointed by and responsible to the Governor, but constitutionally and practically responsible to Parliament—is said by some authorities to have been effected solely by despatches from the Secretary of State to Colonial Governors. These despatches described the circumstances in which the Crown, through the Governor for the time being, would exercise its right of displacing one set of public servants and of appointing others in their places—that no change would be made so long as those public servants, being Ministers in charge of Departments, possessed the confidence of the local Legislature. In the body of the Constitution Act of New South Wales (and this remark applies equally to that of Victoria) the words "responsible ministers" do not occur. Were it not for a marginal note to one of the sections, not even a hint would have been given on its face of the important change it was intended to effect.

Other constitutional jurists, however, affirm that section 37 of the Constitution Act of New South Wales, and the corresponding section of that of Victoria, contains provisions which assume if they do not originate some plan of ministerial and responsible government. Both those sections declared that appointments of all public offices shall be vested in the Governor with the advice of the Executive Council, "except the appointment of officers liable to retire from office on political grounds which appointments

shall be vested in the Governor alone." The Constitution Acts of South Australia, Queensland and Western Australia, contain substantially similar sections. But section 18 of the Constitution Act of Victoria and section 32 of the Act of South Australia went much further in the direction of expressly recognizing and introducing responsible government. Those sections enacted that a certain number of officers of the Governments in those colonies for the time being should be members of the Legislature created by the new Constitutions. On 22 May 1856, the first Parliament of New South Wales under the new Constitution was opened by Sir William T. Denison. The first Responsible Ministry had Mr. Alexander Donaldson as Colonial Secretary and Premier.

Administration and Legislation.— With the establishment of responsible Government in New South Wales the initial pulsations of political life in Australia may fairly be said to date their beginnings. The Governor of the colony was the representative of the Crown, but he was no longer his own Prime Minister. In 1859 a new Parliament was elected under the provisions of an Act to Amend the Constitution, introduced and passed by the advice of the Cowper Administration, providing for increased electoral representation, vote by ballot and manhood suffrage which in later years was developed into "one man one vote," and finally into "one adult one vote."

In 1860 the Robertson Ministry introduced two Land Bills, one providing for the alienation and the other for the pastoral occupation of Crown lands. The main principles of these bills were free selection — before survey, which constituted the battle cry of the land reformers. In 1861 the bills were again introduced into the Assembly, Mr. Robertson resigned his seat in the Assembly and was appointed a member of the Council in order to pilot the bills through that Chamber. Both bills were again passed by the Assembly and sent to the Council. In order to counteract and overcome the opposition in the Council it was decided to swamp that Chamber by the appointment of 21 members. A parliamentary crisis was thus brought about. A majority of the old members withdrew from the Chamber, thus leaving it without a quorum and the fresh nominees could not be sworn in. The term of office of the first members of the Council was limited to five years which was then about to expire. The Council was reconstituted by the appointment of 27 life members on 24 June 1861; Wentworth being appointed the first President. In 1862 the Crown Land Alienation Bill and the Crown Land Occupation Bill were passed by both Houses. A Chinese Immigration Restriction Bill embodying the main provisions of Victorian legislation, was also passed.

In 1863 Messrs. Dalley and Parkes returned to the Colony from England where they had been sent on a mission to promote emigration to New South Wales. From this time on Mr. Parkes became a prominent figure in the political world of New South Wales. He was closely identified with the cause of free trade. In 1868 Mr. Parkes resigned, and temporarily withdrew from public life. The most notable public events of this period were the withdrawal of the British troops from New South Wales and Victoria, and the successful transmission of the first through cable message from Australia to England.

In 1872 the Martin-Robertson Ministry was defeated. Mr. Parkes having returned to the House was entrusted with the task of forming a ministry. He retained the premiership until 1875 when his government was defeated on the motion by Mr. Robertson. The Robertson Ministry remained in office until 17 Dec. 1877, when Mr. Parkes formed another ministry which had but a short reign. A political duel went on between Mr. Parkes and Mr. Robertson for a considerable time, but was at last terminated by a coalition of the two leaders who in December 1878, formed a Ministry which lasted until Jan. 1883. In 1881 a Chinese Immigration Restriction Act was passed imposing severe penalties on Chinese entering the Colony, without payment of a poll tax of £10. An Act was passed legalizing trade unions. The Federal Council of Australia was created on 28 Nov. 1883. A rich silver field was discovered at Broken Hill (1883).

The Land Bill of 1882 was the rock on which the Parkes-Robertson Ministry was wrecked. A general election resulted in Mr. (afterwards Sir) Alexander Stuart coming to power which he held until October, 1885. In 1888 another Chinese Restriction Act was passed. The Poll Tax was raised to £100 per head. Chinese were not permitted to engage in mining and they were not qualified to be naturalized. A tonnage limitation was imposed on vessels bringing Chinese to New South Wales; they were not allowed to bring more than one Chinese passenger to every 300 tons.

In February 1890, a Federal Conference, presided over by Sir Henry Parkes, was held in Melbourne, at which it was resolved that a National Australian Convention should be held to draft a Constitution for the federation of the Australian colonies. In March 1891, the Convention was held in Sydney and a draft Constitution was adopted. In October 1891, the last Parkes Ministry was defeated, being succeeded by that of Sir George Dibbs. In 1893 an Electoral Bill was passed embodying the principle of "one man one vote."

In August 1894, the Dibbs' Ministry, which had introduced protection in a modified form, gave way to a free trade Ministry formed by George H. Reid. A new tariff on free trade lines, a land tax, an income tax, and homestead bills were passed under his leadership. Early in 1895 Mr. Reid attended a conference of Premiers at Hobart at which the draft of an Enabling Bill to be introduced into the Legislature of each colony, providing for the election directly by the people of each colony of 10 representatives to attend a Federal Convention to frame a Constitution for the federation of the colonies, to be afterward submitted to a referendum of the people of each colony, was adopted. Subsequently the Parliament of New South Wales, as well as the Parliaments of the other colonies passed identical bills for the aforesaid purpose. It was under the authority of this legislation that the Commonwealth Constitution was afterward framed and adopted. In 1897 an Immigration Restriction Act, based on the Natal Act, imposing an education test in order to exclude colored aliens, was passed.

Legislation on similar lines was adopted in several other colonies.

On 13 Sept. 1899, the Reid Ministry was defeated and Sir William Lyne formed a Government which succeeded in passing the Early Closing Act, the Navigation Act, the Old Age Pension Act, and the Women's Franchise Act. In March 1901, Sir William Lyne retired in order to take office as a Commonwealth Minister. The Ministry formed by Mr. (afterwards Sir) John See succeeded it. One of the most important measures passed through its instrumentality was the Industrial Arbitration Act (1901); under which the principle of compulsory arbitration and settlement of industrial disputes was established. A short-lived Waddell Ministry was followed by one formed by Mr. Joseph Hector Carruthers, and it is still in office (September 1906).

VICTORIA AN OFF-SHOOT OF NEW SOUTH WALES.

Separation.— By Act 13 and 14 Vic., c. 59, (5 Aug. 1850), the district of Port Phillip, bounded on the north and northeast by a straight line drawn from Cape Howe to the nearest source of the river Murray, and thence by the course of that river to the eastern boundary of the colony of South Australia, was separated from the colony of New South Wales, ceased to return members to the Legislative Council of such colony, and was erected into and thenceforth formed a separate colony, "to be known and designated as the colony of Victoria." A Legislative Council was created in and for the new colony having powers and functions similar to those of the newly-organized Council of New South Wales. On 1 July 1851, writs for the election of 20 elective members for the Legislative Council of Victoria were issued; 10 were nominated by the Crown. Mr. La Trobe was appointed Lieutenant-Governor. In this manner the Colony of Victoria was called into existence and received the first impulse of an autonomous political life. The new Council was convened for the despatch of business in November 1851, at about the time when gold was being discovered in fabulous quantities in the famous goldfields of Ballarat and Bendigo. The official members were: Mr. W. Lonsdale, Colonial Secretary; Mr. (afterwards Sir) W. F. Stawell, Attorney-General; Mr. (afterwards Sir) Redmond Barry, Solicitor-General; C. H. Ebden, Auditor-General; and R. W. Pohlman, Chairman of the Court of Requests. J. F. Palmer was elected Speaker.

The New Constitution.— A new Constitution drawn on the same lines, and passed in the same manner as that of New South Wales, was assented to by Her Majesty on 16 July 1855. The only substantial difference between the two bicameral Legislatures was that whilst the Legislative Council of New South Wales was composed of members nominated by the Crown the members of the Legislative Council of Victoria were elected by residential inhabitants having high property qualifications.

Responsible Government.— The Premier of the first Responsible Government was W. C. Haines. The first election for the Legislative Assembly took place in the spring of 1856. The first Ministry resigned on the passing of an unfavorable resolution upon the subject of the Estimates, in March 1859. Sir John O'Shanassy, the mover of the resolution, then became Premier.

Administration and Legislation.— Among the problems which soon engaged the attention of the newly-created Parliament of Victoria were those of Constitutional Reform, Manhood Suffrage, Land and Mining Legislation, Agriculture, Protection, and Free Trade, Inter-Colonial Relations, Public Works, Railways, Telegraphs, Water Supply, Immigration, Chinese Immigration Restriction, Naval and Military Defence, and Education.

Among the first Administrations which held office in Victoria were those of which William Clark Haines was Premier in 1855–57; 1857–58; Mr. (afterwards Sir) John O'Shannassy, Premier, 1857; 1858–59; 1861–63; Wm. Nicholson, Premier, 1859–60; Richard Heales, Premier, 1860–61.

In the early days of the goldfields great discontent existed because of the heavy license fee of 30 shillings per month which every digger was required to pay. In November 1854, the tyrannical policy of the Government culminated in an open insurrection which broke out at Ballarat. A flag of revolt, having the emblem of the Southern Cross, was hoisted over a barricade known as the "Eureka Stockade." By command of Governor Sir Charles Hotham a force of British troops were sent to Ballarat to storm the stockade. Many lives were lost. After this tragic period,— the first and only bloodshed in Australia in the name and for the cause of political freedom,— the grievances of the diggers were redressed.

In 1855 the Legislative Council of the newly-created Colony of Victoria led the way in the passage of a number of laws intended to restrict Chinese immigration, which commenced in 1854, when the fame of the gold diggings of Victoria began to attract thousands of Chinamen to that Colony. The Victorian Council passed a bill, which was assented to by the Governor, "to make provision for certain immigrants." The substance of the law was that no ship should bring to a Victorian port more passengers, being Chinese immigrants, than in the proportion of one person to every 10 tons of the tonnage of such ship, under a penalty of £10 for each passenger in excess of such proportion. On the arrival of a ship in any port of Victoria with Chinese immigrants on board, the master was required to pay to the Collector of Customs a tax of £10 for every such immigrant. The money so collected was to be invested by the Government to form a fund for the relief, support and maintenance of such immigrants. Provision was made for the registration of such immigrants, on their arrival in any district or place to which they proceeded. This and other Immigration Acts were consolidated in 1865.

Another notable measure passed by the first Legislative Council of Victoria was a bill adopting "vote by ballot;" this was the first measure in the history of Parliamentary Government in which this method was made legal.

The first important bill was introduced by James Service as Commissioner of Crown Lands and Surveys in the Nicholson Government, on 30 Nov. 1859. The chief feature in this bill was that of free selection for settlement and agriculture over all the waste land of the Colony, subject to certain conditions with

respect to lands not yet surveyed. The bill was passed by the Assembly but was rejected by the Council.

The period from 1863 to 1866 was memorable in the history of Victoria. It began in a conflict between the parties representing Protection and Free Trade. It then developed into a struggle between the two Houses for financial supremacy, and in its third and last stage it became a contest between the Legislative Assembly and the Crown. The first McCulloch Ministry took office in June, 1863; it remained in power until 6 May 1868. One of its first proposals was a bill imposing numerous customs duties of a protective character. It was passed by the Lower House and rejected by the Council. It was then reintroduced tacked on to the Appropriation Bill. The Council again rejected it, and a deadlock ensued. The Government in the meantime collected duties on the authority of the Assembly alone. Funds not having been voted for payment of the Public Service the Government borrowed money to the amount of £40,000 from the London Chartered Bank which then sued the Government for money lent. The Government confessed judgment. The Supreme Court pronounced the collection of customs duties on the resolution of the Assembly to be illegal. It also held that confessed judgments against the Crown were illegal. A tariff, separated from the Appropriation Bill, was again passed by the Assembly and again thrown out by the Council. The Ministry resigned. Mr. Fellows formed a Government which, however, could not carry on. Mr. McCulloch returned to office and the Tariff Bill was again passed by the Assembly, and again sent up to the Council. The preamble of the bill asserting the exclusive right of the Assembly to grant money and taxes, was eventually withdrawn, and the bill was passed.

The second McCulloch Ministry was defeated on 20 Sept. 1869. It was followed by an Administration formed by John Alexander McPherson which remained in office for six months. It was displaced on 9 April 1870, by Sir James McCulloch, who, on 19 June 1871, was defeated on his Property Tax Proposals. Charles Gavan Duffy then formed a Ministry which successfully proposed and carried a Protectionist Tariff. The Duffy Ministry was defeated on 10 June 1872. The Governor refused a dissolution and James Goodall Francis became Premier. The first Mining on Private Property Bill, was carried in the Assembly by 43 votes to 3, but was rejected by the Upper House. A bill to regulate mines, in order to prevent mining accidents, and to protect miners, was passed.

In 1875 the Kerferd Government introduced a bill imposing certain duties on wines and spirits. The tariff proposals were carried by a majority of one. This the Government accepted as an adverse vote and applied for a dissolution, which the Governor refused. On 7 Aug. 1875, Graham Berry formed his first Ministry, but he was defeated on 20 Oct. 1875. Sir James McCulloch's fourth and last Government then came into power. Its accession marked the beginning of a stormy and momentous political period. The Berry party raised a "stonewall" of obstruction, and the McCulloch party retaliated by passing standing orders to restrict and limit debate, which became known as the "Ironhand" and the "Gag." The McCulloch Ministry became very unpopular throughout the country. At a general election held on 11 May 1877, an immense majority was returned against the Government. Mr. Berry then formed his second Ministry. The principal planks in its program were, a Land Tax to "burst up the large estates," and payment of members. A Land Tax Bill was introduced and passed. Provision for the payment of members, to the amount of £300 per year, was made in the Appropriation Bill. In that form it was sent to the Council where it was rejected on the ground that it was a "tack." Then ensued the historic deadlock of 1877–78. No money having been voted to pay the public servants the Government on 8 Jan. 1878, ordered the dismissal of all heads of departments, County Court Judges, Police Magistrates, and other public officers. This proceeding caused a great sensation, and by the opponents of the Ministry it was denounced as "revolutionary." Shortly afterwards a compromise was arrived at; payment of members was passed in a separate bill and the Appropriation Bill without the obnoxious "tack" was carried. The Berry party then devoted their attention to the question of Constitutional reform. A bill was passed through the Assembly providing for the adoption of a method of referendum to settle disputes between the two Houses. It was rejected by the Council. A deputation, or embassy, consisting of the Premier and Professor Pearson, was sent to England to interview the Secretary of State for the Colonies, who was asked to settle the Constitutional difficulty in Victoria. Sir Michael Hicks-Beach gave a very guarded reply stating that the Imperial Parliament would never alter the Constitution of the Colony at the instance of one House only.

In 1879 the Parliament of Victoria again resorted to legislation in order to arrest the influx of Chinese. Vessels were not allowed to introduce into any Victorian port more than one Chinaman per 100 tons of tonnage, and a poll tax of £10 was imposed on each immigrant on his landing. In April, 1888, a Chinaman, Chun Toy, arrived in the port of Melbourne on board the British ship *Afghan*. The Collector of Customs considered that the *Afghan* had brought a larger number of Chinese than was allowed by law; he refused to allow any of them to land, or to accept the poll tax of £10 each. Chun Toy brought an action against the Collector in the Supreme Court of Victoria, which decided that the action of the Government in preventing the landing of the Chinese prepared to pay the prescribed poll tax was illegal. The Victorian Government appealed from this decision to the Privy Council which reversed the judgment of the Victorian Court, and held (1) that the Collector of Customs was under no legal obligation to accept payment, whether tendered by the master on behalf of any such immigrant, or tendered by or for any individual immigrant; (2) that, apart from the Act, an alien has not a legal right, enforceable by action, to enter British territory.

After an appeal to the Constituencies in March, 1880, Berry resigned, and James Service then formed a Ministry. He introduced a measure to amend the Constitution, which upon a

division was lost by two votes. Parliament was dissolved and a general election was held in June, 1880, which resulted in the Berry party being returned to office with a substantial majority. The principal work done by the third Berry Ministry was the carrying of a bill to amend the Constitution of the Legislative Council by reducing the qualification of electors and of members. A bill was also passed making permanent provision for payment of members. In July 1881, the third Berry Ministry was succeeded by one formed by Sir Bryan O'Loughlin, The O'Loughlin Ministry lost office in March, 1883, when a Coalition Ministry under Service and Berry was formed. Under this Government, Acts were passed for the abolition of political control of the Government railways, by placing them under the management of three independent commissioners, and for the abolition of patronage in the public service. During his premiership, Service took great interest in the question of Australian Federation, and through his instrumentality a convention was held in Sydney at which a scheme for the establishment of a Federal Council was adopted.

The Service-Berry Ministry was followed in February, 1886, by the Gillies-Deakin combination. In 1888 another Chinese Immigration Restriction Act was passed providing that no vessel should enter any Victorian port having on board more than one Chinaman for every 500 tons of the tonnage of such vessel. Any Chinese who should enter Victoria by land, without first obtaining a permit in writing, from some person to be appointed by the Governor in Council, was declared guilty of an offence against the Act, and made liable on conviction to a penalty of not less than £5 nor more than £20 and also upon the warrant of the Commissioner of Trade and Customs, to be removed or deported to the colony from whence he came.

On 5 Nov. 1890, the Gillies-Deakin Ministry was succeeded by a Ministry formed by James Munro, who in his turn gave place in February, 1892, to one formed by William Shiels. The career of the Shiels Ministry, the Patterson Ministry, and the early part of that of the Turner Ministry, which came into office on 27 Sept. 1894, were comparatively uneventful. In February, 1895, Sir George Turner was associated with Reid and other Premiers in a conference held at Hobart at which a Federal Enabling Bill was drafted. The first Turner Ministry was defeated in December, 1899. Allen McLean's Ministry held office for a little over 11 months; during which time several contingents were sent from Victoria to assist the British army in South Africa. On 15 Nov. 1900, Sir George Turner again became Premier in time to make arrangements for the establishment of the Commonwealth. An Old Age Pension Act was passed, also bills protecting the rights and interests of Victorian public servants. In the beginning of 1901 Sir George Turner resigned the Premiership and accepted office as Treasurer in the first Federal Cabinet. Sir Alexander Peacock became head of the new Government. On 3 June 1902, the Peacock Ministry was displaced on a no-confidence motion by W. H. Irvine. During the career of the Irvine Ministry a railway strike occurred in Victoria which resulted in an Act being passed for the separate representation in Parliament of railway and other public servants. On the retirement of Irvine through ill-health he was succeeded by Thomas Bent as Premier, who still holds office (September 1906).

TASMANIA AN OFF-SHOOT OF NEW SOUTH WALES.

Separation.— By the Act 4 Geo. IV., c. 96 (19 July 1823), the Crown was empowered to separate Van Diemen's Land from New South Wales, and erect it into a separate colony which then received a Lieutenant-Governor, an Executive Council and a small Legislative Council, consisting of seven members. By Act 13 and 14 Vic., c. 59, s. 7, it was provided that the Legislature already existing in Van Diemen's Land might establish within the colony a Legislative Council to consist of not more than 24 members, of whom one-third should be nominated by Her Majesty and the remainder elected by qualified inhabitants of the colony. Under the authority of this law a new Legislative Council was called into existence having powers and functions similar to the Legislative Council of New South Wales.

The New Constitution.— During the Governorship of Sir William Denison the new Legislative Council of Van Diemen's Land under the powers conferred by 13 and 14 Vic., c. 59, s. 32, drafted a Constitution for the establishment of a bicameral Legislature in Van Diemen's Land composed of a Legislative Council of 15 members elected by the qualified inhabitants, and a House of Assembly of 30 members elected on a more popular franchise than that of the Council. The bill so drawn was passed by the Legislative Council and reserved by the Lieutenant-Governor for the Royal assent. It became law on 24 Oct. 1856; the first Parliament being opened on 2 Dec. 1856. Sir Henry E. F. Young was appointed the first Governor-in-Chief of the colony under the new system of Responsible Government. The first Premier was William T. N. Champ. In the year 1853, upon the cessation of transportation, the name of the island was changed from that of Van Diemen's Land to Tasmania.

Administration and Legislation.— Upon the cessation of transportation and the grant of Responsible Government to Tasmania a new life and destiny was imparted to the struggling community. Between 1855 and 1872 there was substantial improvement and progress in the position and prospects of the island, marked by the development of the interior, the construction of roads and tramways, the initiation of railway and telegraphic communication, the expansion of the agricultural and pastoral industries, the division of the colony into municipalities, the laying of a sub-marine cable between Tasmania and the mainland, the discovery of tin at Mount Bischoff and other places, gold in the quartz reefs at Brandy Creek, and subsequently of silver and lead at Zeehan, and gold and copper at Mount Lyell. The west coast became famous by the opening up of some of the richest silver lead mines in the world; coal seams were opened at Hastings, Langlock, and Ivanhoe.

In February 1894, whilst the Dobson Ministry was in office the necessity of financial reform became a burning question. Financial proposals were submitted by the Government. A bill to authorize a graduated Land Tax was submitted to the Assembly and rejected; conse-

quently Dobson and his colleagues resigned in April 1894, and Sir Edward Braddon formed a Ministry. An Income Tax was passed, together with a Land Tax imposing one penny per £ on the capital value of all land in the colony. This general tax was adopted as a sort of a compromise instead of the proposed tax on the unimproved capital value of the land which was at first submitted and rejected.

In February 1895, a conference of Premiers was held at Hobart at which the draft of a Federal Enabling Bill was adopted. At a general election held in 1897, a system of voting based upon Hare's preferential method was used for the first time. During the year a Federal Referendum was held at which a large majority of votes was given in favor of the Federal Constitution. In 1899 the Braddon Ministry was defeated and it was succeeded by one formed by Sir Neil Elliot Lewis on 12 Oct. 1899, who retained office until 8 April 1903. On 9 April 1903, William Bispham Propsting became Premier, and on 12 July 1904 he was succeeded by John William Evans, who still holds office (September 1906).

QUEENSLAND AN OFF-SHOOT OF NEW SOUTH WALES.

Separation.— On 6 June 1850, letters-patent were issued erecting the Moreton Bay district into a separate colony, under the name of Queensland, and appointing Sir George Ferguson Bowen to be Captain-General and Governor-in-Chief thereof. The boundary of the new colony was defined as a line commencing on the sea coast at Point Danger, in latitude about 28° 8′ south, running westward along the Macpherson and Dividing Ranges and the Dumaresq River, to the McIntyre River, thence by the 29th parallel of S. latitude to the 141st meridian of E. longitude; on the west the 141st meridian of E. longitude from the 29th to the 26th parallel, and thence the 138th meridian north to the Gulf of Carpentaria, together with all the adjacent islands, their members and appurtenances in the Pacific Ocean. The Governor was authorized to appoint an Executive Council to advise and assist him in the government of Queensland. The Constitution of Queensland was embodied in an Order in Council bearing the same date as the letters-patent.

The New Constitution.— The Order in Council provided that there should be within the Colony of Queensland a Legislative Council and a Legislative Assembly, with the advice and consent of which Her Majesty should have power to make laws for the peace, welfare, and good government of the colony in all cases whatsoever. In its main outlines the Constitution of Queensland was almost a replica of that of New South Wales. The first Parliament under the New Constitution was convened for the despatch of business on 29 May 1859.

Administration and Legislation.— Public events in Queensland became clustered around and associated with the following prominent men who held office as Premier between 1859 and 1899: Robert G. Herbert, Arthur MacAlister, Robert Mackenzie, Charles Lilley, Arthur Palmer, George Thorn, John Douglas, Thomas McIllwraith, Samuel Griffith, Boyd D. Morehead, Hugh Muir Nelson, Thomas J. Byrnes, and James R. Dickson.

From the date of separation Queensland began to advance with rapid strides, and it soon occupied a prominent position in the Australian group. Between 1861 and 1871, under a policy of assisted immigration the population largely increased and the resources of the country were developed in the direction of pastoral and agricultural pursuits, gold and silver mining, sugar and cotton growing. Cotton growing was stimulated by bounties. The pastoral industry was promoted; railway construction was commenced; state aid to religion was withdrawn and a system of primary and secondary education was initiated. Queensland was found to be particularly suitable for sugar growing and a demand for cheap labor quickly sprang up. In course of time shiploads of South Sea Islanders were introduced by the sugar planters and it was soon found necessary for the Legislature to interfere.

A financial crisis occurred in 1865, which in 1866 resulted in a change of Ministry. The first MacAlister Ministry had a short term of office. Herbert was again called to the helm of affairs but in a few months he was again displaced. The second MacAlister Ministry lasted for 12 months and eight days. It secured the passing of an important measure dealing with the cultivation and occupation of Crown lands. It was followed by the MacKenzie Ministry and the Lilley Ministry. The MacKenzie Ministry of 1867 introduced and passed a Crown Land Act which gave greater facilities for settlement. The Lilley Ministry of 1868 passed Acts relating to the Civil Service, Court procedure, and electoral laws. The Lilley Ministry was followed by the Palmer Ministry which lasted from 3 Jan. 1870 to 8 June 1874. In 1875 during the reign of the third MacAlister Administration a State Education Act was passed which embodied the principles of free, secular, and compulsory education. A complete measure of local government was passed in 1878, under the rule of the Douglas Administration. In the same year the first act to restrict Chinese immigration into Queensland became law.

In 1879, Mr. (afterward Sir) Thomas McIllwraith formed his first Government. On 4 April 1883, he made a dramatic and sensational attempt to annex New Guinea, directing H. M. Chester, at Thursday Island to cross Torres Straits and on behalf of Her Majesty's Government in Queensland to hoist the British flag and proclaim the annexation to that colony of that part of the island not claimed by the Dutch. This act was repudiated by Lord Derby, who, however, on 10 Oct. 1884 declared a British Protectorate over the southern part of the island; Germany seized the remainder.

In November, 1883, McIllwraith was defeated and Mr. (afterward Sir) Samuel Griffith succeeded him. During his term of office a convention of Australian representatives was held in Sydney, at which a scheme for the establishment of a Federal Council of Australasia, drafted by Griffith, was adopted and it afterward became law by Imperial legislation. A Crown Lands Act was passed by the Griffith Administration in 1884. It encouraged Crown Tenants to improve their holdings, facilitated *bona fide* settlement and discouraged the speculative acquisition of land. The first Griffith Ministry was succeeded (13 June 1888) by the

second McIllwraith Government, which had only a brief tenure of office, being on 20 Nov. 1888, supplanted by the Morehead Ministry which lasted until the 7 Aug. 1890. The second Griffith Ministry was then formed. In April 1891, Griffith took an active part in a Federal convention held in Sydney at which a draft Constitution for the union of the Australian Colonies was adopted.

The Kanaka labor question became important about this time and the Griffith Ministry advised the reintroduction of Polynesian laborers. On 14 April 1892, the Pacific Laborers' Extension Bill was passed, notwithstanding strong objections urged against the introduction of colored races into Queensland. On 11 Jan. 1893, Griffith was appointed Chief Justice. Mr. (afterward Sir) Hugh Muir Nelson occupied the post of Acting Chief Secretary pending the arrival from England of Sir Thomas McIllwraith who, on 27 March, became Premier of his third and last Administration. In October following he resigned the Premiership in which he was succeeded by Sir Hugh Muir Nelson. In 1894 the great strike of shearers occurred in Queensland, leading to a reign of lawlessness which resulted in the passage of the Peace Preservation Act. In 1896 a Meat and Dairy Produce Act was passed which gave a stimulus to the primary industries. Increased facilities for land settlement were offered.

On 13 April 1898, Sir Hugh Nelson resigned the Premiership and was appointed President of the Legislative Council. The task of forming a new Government was entrusted to T. J. Byrnes who gave promise of a brilliant political career which was cut short by his death, at the early age of 36, after five months of office. Mr. (afterwards Sir) James R. Dickson then became Premier. He was an ardent Federalist and exercised the whole of his influence in favor of Queensland joining the Commonwealth which was then on the eve of being established. He represented Queensland at a conference of Premiers at which the constitution, as adopted by the Convention, was slightly modified. In Sept. 1899 the constitution was submitted to the people of Queensland by a referendum and was approved by a large majority. In December 1899, a Labor Ministry was formed by Anderson Dawson; it lasted six days and R. Philp, a former colleague of Dickson, then formed a Ministry. Philp held office until 17 Sept. 1903. The Labor Party, having in the meantime increased in members and influence, became sufficiently strong to take a share in the Executive Government of the country, and accordingly Arthur Morgan vacated the Speaker's chair and formed a Liberal Labor Government in which the Liberals and Laborites were equally represented. In January 1906, Morgan resigned the Premiership and became Vice-president of the Executive Council, William Kidston, leader of the Labor Party becoming Premier.

WESTERN AUSTRALIA THE SECOND ORIGINAL COLONY.

Foundation.— The first Imperial Act applicable to Western Australia was 10 Geo. IV., c. 22. (1829). It was intituled «An Act to Provide Until the 31st Day of December 1834, For the Government of His Majesty's Settlements in Western Australia on the Western Coast of New Holland.» It will be noticed that the name «Australia» first suggested for the continent in 1814 by Matthew Flinders, is here used and for the first time mentioned by an Imperial Act. By that Act the King, with the advice of the Privy Council, was empowered to authorize any three or more persons resident within the settlements, to make, ordain, and constitute laws, institutions, and ordinances for the peace, order, and good government of His Majesty's subjects and others within the settlement.

A Representative Legislature.— Under the Act 13 and 14, Vic., c. 59 (5 Aug. 1850), Western Australia was granted a Legislative Council, consisting of 26 members, nine of whom were nominated by the Crown and 17 were elected by qualified inhabitants. Three years afterward an agitation was commenced in favor of Responsible Government as it existed in the eastern colonies. In 1874, a draft of a Constitutional Bill was sent to the Secretary of State, who, however, decided that the colony was not yet ripe for the change.

The New Constitution.— The movement was not successful until July, 1890, when a new Constitution was passed by the Imperial Parliament, being embodied in the Act 53 and 54 Vic., c. 26. It created a bicameral Legislature consisting of a nominee Council and an elective Assembly to make laws in and for Western Australia, and along with it Responsible Government was introduced. The first Premier was Sir John Forrest.

Administration and Legislation.— The discovery of goldfields, and a rapid influx of population were factors which largely contributed toward the success of the constitutional movement. The new Parliament was called upon to pass legislation relating to gold mining, land settlement, railway construction, and water supply. Under the old regime a railway 243 miles long had been constructed on the land grant system between Beverly and Albany. Under the terms of the contract, payment was made at the rate of 12,000 acres for every mile of completed road. The lands selected in payment were situated within a belt of 40 miles on each side of the line; half the frontage to the railway was reserved to the Government. In 1896 the Government acquired this private land-grant railway, the purchase price being £1,100,000. The Perth Water Works constructed by the Perth Water Supply Company, was taken over by the Government at a cost of £220,000. Among the lines of railways which greatly assisted in the development of the interior were the lines to Kalgoorlie, Menzies, and Kanowna, penetrating into the heart of the eastern gold-fields. A gigantic scheme of water supply for the conveyance of water through pipes by pumping from station to station, from the Mundaring Reservoir to Coolgardie and Kalgoorlie, a distance of 330 miles at a cost of £2,500,000, was inaugurated, and afterward successfully completed.

In 1897–99 the question of federation came into prominence. The attitude of the Forrest Government toward the new Constitution was not favorable whilst on the gold-fields there was a strong movement in favor of the bill backed up by threats of separation. This led to a change

of attitude on the part of the Government, and at the test referendum that followed a majority of electors voted in favor of Federal union.

In 1899 an Electoral Bill was passed which conferred the political franchise on adult woman; it was exercised for the first time on the occasion of the Federal referendum.

Sir John Forrest retired from state politics in February, 1901, and G. Throssell succeeded him as Premier. The Throssell Ministry was defeated at a general election held the same year. George Leake then formed a Ministry which was short-lived, as also was another formed by Alfred Edwards Morgans. On 23 Dec. 1901 Leake formed his second Ministry and held office until his death on 24 June 1902. He was succeeded in the Premiership by Walter H. James on 1 July 1902. The only notable piece of legislation passed in this period of short-lived Ministries, were the Arbitration and Conciliation Act, and the Workmen's Compensation Act. On 10 Aug. 1904 James was defeated and a Labor Ministry was formed by Henry Daglish. It remained in office until 25 Aug. 1905 when it was displaced — partly by dissension within the ranks of the Labor Party, and ostensibly on the question of purchasing and resuming possession of the Midland Railway. On 25 Aug. 1905 Cornthwaite Hector Rason became Premier of a Liberal Administration, pledged to oppose the extreme policy of the Labor Party. He secured a dissolution and went to the country from which he returned with a strong working majority. He resigned in May 1906, to accept the position of agent-general in London and Newton James Moore became Premier and is still in office (September 1906).

SOUTH AUSTRALIA THE THIRD ORIGINAL COLONY.

Foundation.— This province was originally carved out of that part of the colony of New South Wales lying between the meridians 132° and 141° E. longitude, bounded on the north by the 26° parallel of S. latitude and on the south by the Southern Ocean. This region was never occupied, or settled, by the New South Wales Government. On 15 Aug. 1834, the Act 4 and 5 Wm. IV., c. 95, intituled "An Act to empower His Majesty to erect South Australia into a British Possession or Province, and to provide for the Colonization Thereof" was passed. It did not purport to separate the territory from New South Wales; it seemed to contemplate the whole of that part of the continent as not being subject to any prior statutory authority. It empowered the King to appoint a Governor and Colonization Commissioners, who were to have the control of the Crown lands, with power to survey and sell the same, and to employ a portion of the money so derived in conducting the immigration of laborers from Great Britain. In the exercise of these powers the Province was erected; a Governor, a Judge, seven commissioners, and other officials were appointed. The Governor, with the concurrence of the Chief Justice, the Colonial Secretary, and Advocate-General, or two of them, was authorized to make laws and impose taxes. Captain (afterward Sir) John K. Hindmarsh was appointed the first Governor.

On 28 Dec. 1836, Governor Hindmarsh arrived at Glenelg and proclaimed the establishment of the Government. He was succeeded on 12 Oct. 1838, by Governor Gawler, during whose term of office the settlement became involved in debt to the extent of £281,842. Gawler was recalled (May 1841), and a radical change was made in the government of the colony; the office of Colonization Commission in London was abolished; South Australia was made a Crown colony, and the government was vested in the Secretary of States for the Colonies. Captain (afterward Sir) George Grey was appointed Governor, and almost absolute power was entrusted to him.

In 1842 the Act 5 and 6 Vic., c. 61, intituled "An Act to provide for the better government of South Australia" was passed. Under it a nominated Legislative Council, consisting of the Governor and seven other persons resident in the colony, was created, having power to make laws for its government. On 25 Oct. 1845, Captain Grey was transferred to New Zealand, and Lieutenant-Colonel Robe acted as Governor for a short time. His successor was Sir Henry Fox Young, to whom the colony was indebted for an extensive main road system, and the institution of local government in the shape of District Councils.

A Representative Council.— Under the Act 13 and 14 Vic., c. 59. (5 Aug. 1850) the Legislative Council then established in South Australia was authorized to establish another Legislative Council consisting of not more than 24 members, one third of whom were to be appointed by the Crown and the remainder were to be elected by the qualified inhabitants. This new Council was authorized to make laws for the peace, order, and good government of the province and to impose rates and taxes. On 21 July 1851, this Council consisting of 24 members was duly constituted.

The New Constitution.— In 1853 the Legislative Council of South Australia, in pursuance of powers conferred by section 32 of the Act 13 and 14 Vic., c. 59, passed a bill to establish a bicameral Legislature for South Australia, consisting of a Legislative Council and a House of Assembly. This bill was reserved for the Queen's assent but it was disallowed. Subsequently a second bill to create a bicameral Legislature was introduced in the Council and passed. It provided for the creation of two elective Houses to take the place of the Council created by the Act 13 and 14 Vic., c. 59. This bill eventually received the Royal assent, and is sometimes called the "Constitution Act" of South Australia. It contained provisions and machinery somewhat similar to the Constitution Act of Victoria. The suffrage for the Assembly was manhood coupled with registration and residence. Both Houses were chosen by ballot which was adopted on the motion of Francis S. Dutton, afterwards Premier.

Responsible Government.— The election of members of the two new Houses took place in March 1857. The first session of the new Parliament commenced on 22 April 1857, during the Governorship of Sir Richard Graves McDonnell. The first Premier was B. T. Finnis.

Administration and Legislation.—Among the public men of South Australia, who, in the early history of the Colony under Responsible Government, took an active and prominent part in the great business of administration and legis-

lation were the following who held office as Premiers from 1856 to 1870; Lieutenant-Colonel Boyl Travers Finniss, John Baker, Robert Richards Torrens, Richard Davies Hanson, Thomas Reynolds, George Marsden Waterhouse, Francis Stokes Dutton, Henry Ayers, John Hart, Arthur Blyth, and Henry Bull Templar Strangways.

Mr. (afterward Sir) R. R. Torrens took office in 1857. His name has become famous by association with an act simplifying the transfer, conveyance, and registration of land. Torrens was the originator of the plan; it was based on practical knowledge obtained by him as Collector of Customs, but he was assisted by the legal knowledge of Doctor Hubbe. The Torrens' Land Act system was afterward adopted by all the other Australian colonies. In 1861 a strip of territory lying between latitude 129° and 132° E. longitude and south of the 26° S. latitude known as «No Man's Land» was added to South Australia.

Sir Dominic Daly succeeded Sir Richard G. MacDonnell on 4 March 1862. In March 1863 an intercolonial conference was held in Melbourne at which the majority of the Australian colonies were represented. This conference was originated in a suggestion made by Sir Dominic Daly. It was resolved that it was desirable to settle the basis for a uniform tariff for the Australian colonies. No practical results followed the conference, but it foreshadowed the necessity of some form of Federal Union. In the same year the Northern Territory was added to South Australia by letters-patent.

In 1868–69, a Ministry, of which Henry B. Templar Strangways was Premier, held office. Its career was distinguished by the passing of a Land Act which was intended to promote settlement and prevent the monopolization of the large tracts of land by land sharks and dummies. Sale of land by auction was limited. Land was sold to *bona fide* selectors on credit, the payments being allowed to extend over a period of four years, and no selector was allowed to take up more than 640 acres.

The great overland telegraph line from Port Augusta to Port Darwin, the construction of which was prosecuted during the Premiership of Strangways, John Hart, and Sir Arthur Blyth, was completed on 2 Aug. 1872. In 1875–76 a strong administration formed by Mr. (afterward Sir) James Penn Boucaut, was in power; it introduced a policy of internal development, public works and railways. It was proposed that a loan of £3,000,000 should be raised, coupled with increased taxation, stamp tax, and probate duties. This scheme was passed by the Assembly and rejected by the Council. Mr. (afterward Sir) John Colton formed a Ministry which adopted Boucaut's policy and carried his scheme of public works and railways without the increased taxation. In 1877 Boucaut's second Ministry was in office, and during that year the overland telegraph line between Adelaide and Perth was completed.

The second Boucaut Ministry was succeeded by Administrations of which the following were Premiers from 1878 to 1905: William Morgan, John Cox Bray, John Colton, John W. Downer, Thomas Playford, John Alexander Cockburn, Frederick William Holder, C. C. Kingston, Vaibeu Louis Solomon, and J. G. Jenkins.

In 1886 the jubilee of South Australia was celebrated. C. C. Kingston came into power in 1893. A Crown Lands Consolidation Act was passed by his Ministry which restricted the sale of Crown lands by auction, introducing a system of leasing country lands, coupled with the right of purchase and provided perpetual leases for agricultural purposes. Small blocks not exceeding the unimproved value of £100, were thrown open for lease on the application of working men. Personal residence on a block was necessary, either by the lessee or by his wife or children. The rent of each lease was notified in the 'Gazette'. These lots were not subject to a revaluation, but were liable to land tax. In 1894 a bill was passed conferring the franchise on women. In order to give encouragement and to grant assistance to the farmers an Advance to Farmers' Act was passed in 1896, under which a State Bank has been established in South Australia with power to grant loans to farmers at a low rate of interest with extended time for repayment of the principal.

On 25 April 1896, a general election was held in South Australia at which women exercised their right to vote; about 66 per cent of the women whose names were enrolled recorded their vote. On 22 Jan. 1897, Sir Samuel J. Way, Chief Justice of South Australia, was appointed a member of the Judicial Committee of the Privy Council. On 22 March the Federal Convention held its first session at Adelaide, at which the first preliminary draft was prepared. Mr. Kingston being defeated 1 Dec. 1899, resigned, and V. L. Solomon formed a Ministry which was defeated on 7 December. F. W. Holder then became Premier. An Early Closing Act, and a Workmen's Compensation Act were passed. The gunboat Protector, belonging to South Australia, was despatched to the Chinese Sea to assist in a naval demonstration against the Boxers. In May 1901, Holder resigned in order to accept office in the Federal Parliament. He was succeeded in the Premiership by J. G. Jenkins, who held office in the Playford, Kingston, and Holder Cabinets. He undertook the difficult task of carrying constitutional amendments rendered necessary by the adoption of the Federal Constitution transferring certain powers, functions, and departments from the State to the Federal Government. He succeeded in carrying a measure reducing the number of responsible ministers, reducing the number of members of the Assembly from 54 to 42, and reducing the number of the Council from 24 to 18. He resigned on 1 March 1905, and accepted the appointment of Agent-General for South Australia in London. A Ministry of which Richard Butler was Premier then took office. A general election took place in May at which Butler's party was defeated and on 20 July he resigned, and was succeeded as Premier by Thomas Price who still holds office (September 1906).

Sir John Quick,
Member of Commonwealth House of Representatives; Joint Author of 'Constitution of Australian Commonwealth'.

5. **Australia — The Commonwealth — Its Constitution, Government, and Administrative Departments.** *The Beginning of the Federal Movement Towards Political Union.*— Under the Acts of 63 and 64 Vic., c. 12, (1900) known as the "Commonwealth of Australia Constitution Act," the people of New South Wales, Victoria, South Australia, Queensland, Tasmania, and Western Australia were united in a Federal Commonwealth under the name of The Commonwealth of Australia; and the old colonies under the name of states, were declared to be parts of the Commonwealth. This great act marked the completion and consummation of a movement in favor of Australian federation, which extended over a period of nearly 60 years.

In 1847, Earl Grey, Secretary of State for the Colonies, proposed to create a separate Legislature in and for Australia in which all the colonies then in existence should be represented, and which should have power to make laws in matters of common concern. In 1849, the Privy Council proposed that there should be a General Assembly having power to deal with

customs duties, postal matters, and to create a Supreme Court of Appeal. In 1853, a Committee of the Legislative Council of New South Wales recommended the establishment of a General Assembly. All these proposals, however, were regarded as premature. The following is a summary of other unsuccessful efforts in the same direction: (1857) a select committee of the Victorian Legislative Assembly agreed that "the time for union had come;" in the same year a select committee of the New South Wales Parliament passed a similar resolution; (1860), a select committee of the Victorian Assembly recommended negotiation; (1862), the Colonial Secretary of South Australia commenced correspondence with other colonies urging that a uniform tariff was indispensable; (1863), Tariff conference in Melbourne; (1865), Inter-Colonial conference at Sydney resulting in agreement by which the Murray border was made free of fiscal restriction; (1867), Inter-Colonial conference in Melbourne in reference to ocean postal service to Australia, at which Sir Henry Parkes said "the time has arrived when the colonies should be united;" (1880), Inter-Colonial conference in Melbourne, at which a resolution was passed that "a Federal Council was needed to deal with the question of inter-colonial interest;" (1883), Inter-Colonial conference at Sydney, at which the necessity of a Federal Council was affirmed, and at which a Draft Bill was adopted which afterwards became law. (This Council, however, was not a success as only three of the colonies joined it;) (1890), Federal conference in Melbourne convened by Sir Henry Parkes at which resolutions were passed affirming the necessity for an early convention of the representatives of all the colonies to prepare a scheme for a Federal Constitution.

Convention of 1891.—On 22 March 1891, the first Federal convention was held in Sydney at which all the Australasian colonies, including New Zealand, were represented by seven delegates chosen by the Parliament of each colony. A constitution was draftd and adopted by the convention, but no practical action was taken to give it effect. In January, 1895, a conference of Premiers was held at Hobart, at which all the Australasian colonies were represented. It was resolved that "a convention, consisting of 10 representatives from each colony, directly chosen by the electors, be charged with the duty to frame a constitution; that the constitution so framed be submitted to the electors for acceptance or rejection by direct vote." Five of the six colonies, viz.: New South Wales, Victoria, South Australia, Tasmania, and Western Australia elected 10 representatives. Queensland did not take part in the convention which met in Adelaide in March 1897. C. C. Kingston, then Premier of South Australia, was elected president of the convention, which afterwards sat in Sydney and Melbourne. A constitution was drafted, subsequently submitted to the people of the various colonies, and ratified, Queensland coming in at the last moment. The constitution so drafted and ratified by the people of Australia was afterwards embodied in an Imperial Act, came into force and the Commonwealth was proclaimed.

The Federal Constitution.—The Federal constitution came into force and the Australian colonies were united on 1 Jan. 1901. By this constitutional instrument a new Parliament was called into existence, as well as a new executive, and a new judiciary. The union of people and states, so organized and constituted, in many respects resemble that of the United States of America. The new form of government has been created for special and limited purposes to deal with matters of common Australian interests. The power and authority of the Federal Parliament, and Federal Government, are limited and restricted to such powers and authorities as have been expressly taken from the states, or such new powers as are specified and particularized in the instrument. The Governments and Parliaments of the states have the same legislative and executive scope as before — save as to matters delegated to the Federal authority. In this respect the Australian Constitution differs from that of Canada, which limits and defines the powers of the provinces, and confers upon the Dominion Parliament all the residue of sovereign power.

Executive Department of the Commonwealth.—The executive power of the Commonwealth is vested in the King, and exercised by the Governor-General as the King's representative. It includes the maintenance of the constitution and the excution of the laws of the Commonwealth. There is an Executive Council to advise the Governor-General in regard to the government of the Commonwealth. The Governor-General can appoint ministers to preside over the several departments. No minister can hold office longer than three months, unless he be a member of the Senate or of the House of Representatives. There can be no more than seven ministers in office at the same time. The sum of £12,000 per annum is appropriated to be divided among ministers by themselves.

Immediately upon the establishment of the Commonwealth the departments of customs and excise in all states were by operation of law taken from the states and transferred to the Commonwealth. By proclamation later on, the departments of post offices, telegraphs, and telephones, naval and military defence were taken from the states and vested in the Commonwealth. Four new Federal departments were also created by proclamation, viz., the Department of External Affairs, the Department of Home Affairs, the Department of the Treasury, and the Department of the Attorney-General.

Legislative Department of the Commonwealth.— The legislative power of the Commonwealth is vested in a Federal Parliament consisting of the King, or Queen, of the United Kingdom, the Senate and the House of Representatives. The Senate consists of representatives from each of the six states directly chosen by the people of each state voting as one electorate; each state is entitled to six senators. Senators are chosen for six years, one-half retiring every three years. The House of Representatives is composed of members directly chosen by the electors of the Commonwealth; the total number of such members must be as nearly as practicable twice the number of the senators. The Senate is called the State House, the House of Representatives is called the National Chamber, in which the people of each state are represented according to popula-

tion, save and except that no state to have less than five members. In the first Parliament New South Wales sent 26 members to the House of Representatives, Victoria sent 23, Queensland sent nine, South Australia sent seven, Western Australia and Tasmania sent five each. The House of Representatives continues to exist for a period of three years from the first meeting, unless sooner dissolved by the Governor-General. In case of a deadlock between the two Houses extending over a certain time the Governor-General may under certain conditions and circumstances dissolve both Houses and send them to the people; after such a double dissolution a joint sitting of both Houses of the newly elected members must be held at which they deliberate and vote upon the proposed law in dispute.

The Federal Parliament can make laws respecting trade and commerce, taxation, bounties, borrowing, postal, and telegraphic matters, naval and military defence, light houses, fisheries, census, currency, inter-state insurance, weights and measures, negotiable instruments, bankruptcy, copyrights, patents, naturalization, foreign co-operations, marriage and divorce, old age pensions, service and execution of process, immigration, influx of criminals, external affairs, relations of the Commonwealth with the islands of the Pacific, acquisition of property for Federal purposes, control of railways for naval and military transport, acquisition of state railways with the consent of such state, construction of railways through a state with the consent of such state, conciliation and arbitration for the settlement of inter-state industrial dispues, seat of government of the Commonwealth, and departments of the public service.

Judicial Department of the Commonwealth.—The judicial power of the Commonwealth is vested in a High Court consisting of a Chief Justice, and not less than two other justices. The High Court has appellate and original jurisdiction. It has jurisdiction to hear appeals from all other Federal courts, or courts exercising Federal jurisdiction, and from the Supreme Courts of states in the exercise of jurisdiction conferred by state laws. The High Court must be regarded as a Federal Court of Appeal, and a National Court of Appeal, and as such it holds a wider jurisdictional area than its great exampler, the Supreme Court of the United States of America, which cannot entertain appeals from state courts in cases not involving Federal issues. The Act confers a new right of appeal from the Supreme Courts of States in state law cases, but it does not abolish the existing right of appeal in those cases to the Privy Council. The latter right still remains. The High Court, though a general Court of Appeal for Australia is not the sole or exclusive, but a concurrent Court of Appeal in state law cases. Parties to cases decided by the Supreme Courts of state on matters of state law here, therefore, an alternative right of appeal, either to the Privy Council direct or to the High Court.

The judgments of the High Court are declared by the constitution to be final and conclusive. This negatives the right of litigants in the High Court to appeal to the Privy Council as a matter of right. The appeal as a matter of right has been taken away, but the constitution has left unimpaired any right the King may be pleased to exercise by virtue of his prerogative to grant special leave of appeal from the High Court to His Majesty in Council. To this reservation of the prerogative to grant leave there is, however, a most important exception. No appeal can be permitted to the King in Council from a decision of the High Court upon any question as to the limits *inter se* of the constitutional powers of the Commonwealth and those of any state, or states, or as to the limits *inter se* of the constitutional powers of any two or more states unless the High Court shall certify that question is one which ought to be determined by His Majesty in Council.

The High Court has original jurisdiction to decide all matters arising under any treaty, all matters affecting Consuls, all matters in which the Commonwealth is a party, all matters between states or between residents of different states in any matters arising under the constitution or involving its interpretation.

The several courts of the states have been vested with Federal jurisdiction to deal with matters arising under the constitution, or involving its interpretation, and in matters of any laws made by the Federal jurisdiction.

Finance and Trade.—During the first 10 years after the establishment of the Commonwealth, the Federal Government has only a limited use of the revenue derived from customs and excise duties. It can only use for Federal purposes one fourth of the total of the net sum so collected. The remaining three-fourths must be paid to the several states according to the following method of distribution, viz., each state is credited with the whole of the revenue collected in it and each state is debited: (A.) with departmental expenditure actually incurred in such state; and (B.) with a proportion on a population basis of the other expenditure of the Commonwealth. The Commonwealth pays to each state monthly the balance in favor of each state. Upon the imposition of uniform customs duties in October, 1901, trade, commerce, and intercourse between the states, whether by land or by sea became absolutely free.

Relations of States to the Commonwealth and the Crown.—The relations of the Australian states to the Commonwealth and to the Crown were authoritively expounded by the Secretary of State, Mr. Chamberlain, in the despatch dated 15 April, 1903, directed to the Lieutenant-Governor of South Australia in reference to the case of the Dutch ship "Vondel." The owners of this ship complained to the British Government that the state government of South Australia had declined to arrest the crew of the ship while she was in South Australian waters. The Secretary of States brought the complaint under the notice of the Governor-General of Australia. The Federal government forwarded the papers to the state government desiring them to furnish a report on the case. The state government refused to report to the Federal government on the ground that the latter had no jurisdiction in the matter. The constitutional issues raised by the action of the South Australian government were dealt with at length in Mr. Chamberlain's

despatch: «So far as other communities in the Empire or foreign nations are concerned, the people of Australia form one political community for which the government of the Commonwealth alone can speak, and for everything affecting external states or communities which takes place within its boundaries, that government is responsible. The distribution of powers between Federal and state authorities is a matter or purely internal concern of which no external country or community can take cognizance. It is to the Commonwealth and to the Commonwealth alone that, through the Imperial government, they must look for remedy or relief for any action affecting them done within the bounds of the Commonwealth, whether it is the act of a private individual, of a state official, or of a state government. The Commonwealth is, through His Majesty's government, just as responsible for any action of South Australia affecting an external community as the United States of America are for the action of Louisiana or any other state of the Union. The Crown undoubtedly remains part of the constitution of the state of South Australia, and in matters affecting it in that capacity, the proper channel of communication is between the Secretary of State and the State Governor. But in matters affecting the Crown in its capacity as the central authority of the Empire, the Secretary of State can, since the people of Australia have become one political community, look only to the Governor-General as the representative of the Crown in that community. The view of your ministers would, if adopted, reduce the Commonwealth to the position of a Federal League, not a Federation, and appears to me to be entirely opposed not only to the spirit but to the letter of the Act.»

Administration and Legislation.—The first Federal government was formed by Mr. (afterward Sir) Edmund Barton. The principal measure passed by the first Parliament were as follows: A Uniform Tariff Act, an act to restrict immigration by the imposition of an educational test for the purpose of excluding colored races and to exclude laborers coming to Australia under contract of service; an act to abolish Kanaka labor in connection with sugar growing, and to encourage the use of white labor by granting a bonus of £2 per ton on sugar so produced; an act establishing a uniform suffrage for both the Senate and the House of Representatives; a naval agreement with the admirality under which the Commonwealth undertook to pay £200,000 per year for 10 years towards the maintenance of a navel force on the Australian station; an act to organize the High Court, of which Sir Samuel Griffith was appointed Chief Justice, Sir Edmund Barton, and R. E. O'Connor, Justices.

An administration formed by Alfred Deakin came into office on 24 Sept. 1903. The first Parliament was dissolved on 23 November, and the second Parliament was convened for business on 2 March 1904. The Deakin ministry was defeated on 26 April by an amendment to the Conciliation and Arbitration Bill proposed by the Labor Party extending it to state railway servants. J. C. Watson then formed a Labor ministry. On 17 August an adverse amendment to the Conciliation and Arbitration Bill, limiting the principle of preference to unionists was carried against the Labor ministry and they resigned. G. H. Reid, leader of the Free Trade Party, next formed a government in combination with a number of Protectionists, including Sir George Turner and A. McLean. They successfully wound up the business of the session. Parliament reassembled on 26 July, 1905, when the Reid ministry was defeated. Deakin formed his second ministry which received the support of the Labor party. Among the measures passed this session were a Commerce Act; Sugar Bonus Extension Act, and a Trade Marks Act — the latter containing clauses legalizing the «Union Label.» Acts were also passed modifying the educational test and the contract labor clauses of the Immigration Act.

Bibliography — See article AUSTRALIA — POLITICAL HISTORY.

SIR JOHN QUICK,
Member of Commonwealth House of Representatives; Joint Author of 'Constitution of Australian Commonwealth.'

6. Australia — The States, Their Constitutions and Governmental Departments. *Colonies Transformed Into States.*—Under the Constitution of the Commonwealth Act, the colonies of New South Wales, Victoria, Tasmania, Queensland, Western Australia, and South Australia, have been converted into states of the Federal Union, and certain legislative, executive, and judicial powers formerly vested in colonial authorities have been transferred to the Commonwealth.

Executive Departments of States.— In each state there is a Governor representing the King, and he is the head of the executive as well as a branch of the legislature. In the administration of public affairs the Governor is assisted and advised by responsible ministers who preside over the public departments and generally have seats in the Legislature.

In New South Wales the Governor receives a salary of £5,000. There are six responsible ministers, among whom the public departments are distributed as follows, viz.: (1) Premier and Treasurer; (2) Colonial Secretary; (3) Attorney-General, and Minister of Justice; (4) Lands; (5) Instruction, Labor, and Industry; (6) Mines and Agriculture. The sum of £10,400 is appropriated for payment of ministers in such proportions as may be arranged among themselves.

The Governor of Victoria receives a salary of £5,000; the various public departments are presided over and distributed among ministers as follows, viz.: (1) Premier, Treasurer and Minister of Railways; (2) Chief Secretary and Minister of Labor; (3) Attorney-General and Minister of Justice; (4) Lands; (5) Public Instructions; (6) Works; (7) Mines and Forests; (8) Water Supply and Irrigation Two ministers must sit in the council. The aggregate amount of salary payable among ministers is £8,400 per year. A minister being a member of one House may attend the other House by its permission, and speak upon and explain bills relating to his department.

In Queensland the Governor's salary is £5,000. There are seven salaried ministers among whom the offices are distributed as follows, viz: (1) Premier, Chief Secretary and Secretary for Railways; (2) Treasurer; (3)

Home Secretary; (4) Secretary for Agriculture and Public Works; (5) Attorney-General, Secretary of Mines; (6) Secretary of Lands; (7) Public Instruction. The aggregate amount of salary payable among ministers is £7,300 per year.

The Governor of Tasmania receives a salary of £2,750. Ministerial offices are distributed as follows, viz.: (1) Premier and Chief Secretary; (2) Attorney-General; (3) Treasurer and Lands; (4) Mines and Works. The aggregate amount of salary payable among ministers is £3,000 per year.

In South Australia the Governor's salary is £4,000. There were formerly six responsible ministers, but by the Constitutional Amendment Act of South Australia, (1901), the number was reduced to four, and the aggregate salary divisable amongst them is £4,000 per year. The offices at present are distributed amongst them as follows, viz.: (1) Premier, Education and Works; (2) Treasurer and Attorney-General; (3) Chief Secretary; (4) Lands, Mines and Agriculture.

The Governor of Western Australia receives a salary of £4,000. There are five ministers holding offices as follows, viz.: (1) Premier and Treasurer; (2) Education; (3) Colonial Secretary; (4) Railways and Labor; (5) Mines and Justices. The aggregate amount of salary payable amongst ministers is £7,200 per year.

Legislative Departments of States.—The State Parliaments have no longer any control over customs, excise, post offices, telegraphs, telephones, navy, and military defences.

The Parliament of New South Wales, like that of every Australian state, consists of a Legislative Council and a Legislative Assembly. The council is still a nominated body as it was at the beginning of responsible government, being composed of about 65 life members. There were before Federation 125 members of the Assembly; in 1901 that number was reduced to 90 as one of the results of the transfer of certain powers and functions to the Commonwealth government. Plural voting was abolished in 1893. Manhood suffrage, established in 1858, was in 1903 superseded by adult suffrage; that is to say, "one adult person one vote." Since 1899, each member of the Assembly receives the sum of £300 per year in reimbursement of his expenses together with a free railway pass. Members of the council receive free railway passes but no payment. The Assembly is a triennial chamber, but it may be at any time dissolved by the Governor. Elections are conducted by ballot: this being the method of election of members in all the Australian states.

By the Constitutional Amendment Act, (1903), the Legislative Council of Victoria consists of 35 members, one of whom is directly elected by, and represents, the public and railway servants; the others are elected by qualified voters of whom there are three classes, viz.: (1) owners of freehold land of the annual value of £10; (2) rate-paying occupiers of land of the annual value of £15; (3) university and professional men. The property qualifications of a member of the council were formerly ownership of freehold land of the annual value of £100; that has been reduced to £50. The tenure of a seat in the council is six years; one-half the members retiring every three years. In the event of a deadlock between the two Houses on matters of ordinary legislation, (constitutional alterations being excepted), the Governor may, subject to certain conditions, dissolve both Houses. The council has power by message to the Assembly to suggest amendments in the Appropriation Bill. Manhood suffrage coupled with "no plural voting" is the franchise for the Assembly in addition to which, however, every owner of freehold land of the capital value of £100, and of the annual value of £5 is entitled to be registered for, and to record his vote in every electorial district in which such land is situated; the act abolishing plural voting prohibiting him, however, from voting more than once on the same day. There are 68 members of the Assembly. Public and railway officers are unable to vote in and for ordinary electorates; instead of which they are allowed to choose three special members to represent them in the Assembly. Members of this House receive £300 per year, and a free railway pass. Legislative councillors receive free railway passes but no payment. The Assembly is a triennial chamber, but it may be dissolved by the Governor at any time. Every elector is qualified to be chosen as a member.

In Tasmania the Legislative Council consists of 18 members elected by resident inhabitants possessed either of freehold land of the annual value of £20, leasehold of the annual value of £40, or having university or professional qualification (Constitutional Amendment Act, 1901). The Assembly consists of 35 members elected by adult suffrage coupled with residential qualification. Members of both chambers receive an honorarium of £100 each, subject to their attending a certain number of days per session. An act to confer the franchise on women was passed in 1904.

In Queensland the Legislative Council, like that of New South Wales, is a nominated body consisting of 37 members; they are appointed by the Governor in council, and subject to certain attendance each session they hold their seats for life; they receive no payment, but are entitled to free railway passes. The Assembly consists of 72 members elected practically by manhood suffrage; but owners of freehold land of the value of £100, and household occupiers of the annual value of £10 are entitled to vote in every electorial district in which they have that property qualification. The Assembly exists for three years unless previously dissolved, and its members receive a remuneration of £300 per year, and free railway passes, and allowances for traveling expenses. Every elector is qualived to be chosen a member.

In Western Australia the Legislative Council consists of 30 members elected by adult persons having as a qualification, either freehold lands of the capital value of £100, or leasehold of the annual value of £25, or being Crown lessees or licensees of land of the annual value of £10. The tenure of seats is six years: one-third retiring every two years. (Constitution Act, 1890). The Assembly consists of 50 members elected by adult persons being residents of an electorate, but persons having freehold land of the capital value of £50, or leasehold

land of the annual value of £10, are entitled to vote in any district in which they hold the property qualification. The Assembly, like other popular chambers of Australia, is a triennial House. A bill conferring the franchise on women was passed in the year 1899.

Under the provisions of the Constitutional Amendment Act (1901), the number of members of the Legislative Council of South Australia was reduced from 24 to 18. Under earlier acts the members are elected by adults of both sexes, having as a property qualification either a freehold estate of the capital value of £50, or a leasehold of the annual value of £20 with three years to run, or being the occupier of a dwelling house of the annual value of $25. Members of the council hold their seats for six years, one-half retiring every three years; unless the chamber is sooner dissolved by the Governor: which can be done in cases of disputes, or deadlocks between the two chambers extending over a certain time. By the Constitutional Amendment Act of (1901) the number of members of the Assembly was reduced from 54 to 42. The Assembly is a triennial chamber, unless previously dissolved. In the event of a deadlock between the two Houses in reference to a proposed law it is within the power of the Governor to dissolve them both, subject to the following limitations, viz.: (1) It must have been passed by the Assembly and rejected by the council in one session; (2) it must have been, after a general election, passed a second time by an absolute majority of the whole number of members of the Assembly and a second time rejected by the council. Members of both Houses are entitled to receive £200 per annum each and free passes over government railways.

Judicial Departments of States.—The Supreme Court of New South Wales is constituted under Act 4, Geo. IV., c. 96, and 9, Geo. IV., c. 83. It consists of a Chief Justice and six other justices. It has unlimited civil and criminal jurisdiction. Circuit districts and circuit courts are established to try civil actions and determine crimes and misdemeanors. The Supreme Court has appellate jurisdiction to hear appeals from all inferior courts. There are seven district courts having jurisdiction in personal actions not exceeding £200 and a limited criminal jurisdiction. Courts of Petty Sessions having summary jurisdiction to deal with minor offences and a limited civil jurisdiction presided over by a Stipendary Magistrate, or by two or more justices, exist in all cities, towns and centers of population.

There is a Supreme Court in and for Victoria, constituted under the authority of the constitution. It consists of a Chief Justice and four justices. It is unlimited in civil jurisdiction as well as jurisdiction to try crimes and misdemeanors; as a full court it has appellate jurisdiction from all inferior tribunals. Courts of General Sessions of the Peace having jurisdiction to inquire into a limited class of indictable offences and to hear appeals from Courts of Petty Sessions, exist in certain proclaimed districts. Wardens Courts and Courts of Mines exist for hearing mining disputes. County Courts having authority to decide all personal actions up to the amount of £500. Courts of Petty Sessions having summary jurisdiction in minor criminal matters and civil jurisdiction up to the amount of £50.

The Supreme Court of Tasmania consists of a Chief Justice and two puisne judges; it has both original and appellate jurisdiction in common law, equity, ecclesiastical, and criminal matters. Local courts can deal with civil matters, some up to £100, and others up to £50. Justices in Petty Sessions can make convictions and orders in minor or criminal matters.

The Supreme Court of Queensland may be composed of not less than four, and not more than five judges. It has the same jurisdiction as the Superior Courts of Common Law, and the High Court of Chancery, in England; it also possesses ecclesiastical and criminal jurisdiction. An appeal lies to the full court from all inferior courts. District courts are vested with a limited civil and criminal jurisdiction. Courts of Petty Sessions and Small Debt Courts exercise a limited authority in specified civil and criminal matters. Wardens Courts are constituted to deal with mining disputes.

The Supreme Court of Western Australia was established by Royal Charter in 1861, and the main provisions relating to its constitution and jurisdiction are contained in the Supreme Court Act, (1880.) It has jurisdiction in common law, equity, ecclesiastical and criminal matters. Local courts similar to those in some of the other Australian states can decide small debt cases. Justices in Courts of Petty Session can summarily convict, imprison, or fine persons guilty of minor offences. Warden Courts have authority to deal with mining cases.

The Supreme Court of South Australia is composed of a Chief Justice and two other puisne judges. Its jurisdiction extends to all matters of law and equity. It has also jurisdiction in crimes and misdemeanors. It is the court of appeal from the decisions of all inferior courts. South Australian local courts are to some extent analogous to the district courts and county courts of other states. Some of these courts have jurisdiction in civil matters up to the amount of £490; other local courts are limited to actions where the debt or damage claimed is no more than £20.

Bibliography. See article AUSTRALIA — POLITICAL HISTORY.

SIR JOHN QUICK,
Member of Commonwealth House of Representatives; Joint Author of 'Constitution of Australian Commonwealth.'

7. Australia — Municipal and Local Government. *Introductory and General.*— The organization of municipal government in Australia is modeled largely on the English system and is composed of mayors, aldermen and councilors in the chief cities and larger towns, with district or shire councils, local or divisional boards (the nomenclature varies in the different States) presided over by elected chairmen or presidents in the small towns or villages, and outlying districts where settlement is sparse. All of these are creations of statute deriving their authority, power, and duties from the Parliaments of the various States. No salaries are paid to the mayors who in the capital and most of the larger towns are voted an annual allowance by the councils for entertaining and keeping up the traditional dignities of the office. In

Melbourne the vote is £1,500, in Sydney and Adelaide £1,000. The mayor has no direct power of veto over the council's actions. He represents the city as a whole and presides over the council and undertakes only those duties which devolve naturally on the leading officer of a city. The paid officials are non-partisan appointed by the councils and form a permanent staff holding their positions during good behavior; the head of which (as in England) in the cities is the town clerk. The terms municipal and local government are interchangeable as applying to (a) the cities and the larger towns of the Commonwealth, of which the capitals are types, and (b) to the smaller towns and outlying districts which are simply microcosms like unto the larger bodies but with functions of a more prosaic and limited character conditioned mostly by population. In fact it may be taken as axiomatic that when the government of the cities is understood everything of importance to the student is known about municipal and local government in the Commonwealth of the newest of the nations.

Nominations for municipal offices usually require the signatures of proposer, seconder, and candidate. In Melbourne 10 ratepayers' signatures are required together with a deposit of £10. Secret voting, or voting by ballot as it is styled, is the universal system, which had its origin many years ago in Australia and has since found world-wide acceptance.

Generally speaking adult owners and occupiers of real estate assessed for taxation who have paid their rates, whether residents or non-residents, are entitled to vote in the cities of Australia. Aliens are barred in some cities and women are not yet universally welcomed to the council chambers although they may vote.

The councils of the capital cities are single chambers, aldermen and councilors sitting together, presided over by the Mayor. Except in the Federal Government, and in the State Parliaments where it is universal, the bicameral system of government as it exists in some American cities is unknown in Australia.

The Origin of Local Government.— The beginning of municipal government in Australia dates back to 1839 when the first municipal law (based on the English Statute of 1835) was passed in the State of South Australia and put into operation in 1840 in the city of Adelaide whose virgin soil was surveyed in 1836. The parent city of Sydney, the capital of New South Wales, established in 1788, was incorporated in 1842. Melbourne, the chief city of the State of Victoria originated as a small settlement in 1835 and was incorporated in 1842 by the legislature of New South Wales of which State it then formed an integral portion. The other capital cities are: Brisbane (Queensland), founded 1826, incorporated 1859; Perth (West Australia), founded 1829, incorporated 1871; Hobart (Tasmania), founded 1804, incorporated 1857.

Local Government in New South Wales.— The city council of Sydney is composed of 24 aldermen, one of whom is elected by the council annually to be Lord Mayor. Two aldermen for each of the 12 wards are elected by ballot by the ratepayers every two years. Plural voting obtains, based on assessment values up to four votes. Owners, leaseholders, occupiers and lodgers are entitled to vote. Accounts are audited by State Government inspectors. Assessments are based on rental values of improved property.

The condition of local government in this State is admittedly unsatisfactory. In the metropolitan area the agitation for a "Greater Sydney" is still proceeding by which its advocates hope that the city council will absorb the small surrounding suburban local governing bodies, of whom there are no less than 41 each with its own separate mayor, council, officered staff, and administration.

The number of municipalities in New South Wales is only 192, covering an area of 1,810,912 acres with an annual value for assessment purposes of £8,351,420 and a very large area still remains under the control of the State Government which is now considering proposals to extend the system of local government by the creation of shire councils and new municipalities allowing such bodies to levy their rates on the unimproved capital value of the land instead of on the annual value of improved property.

Besides the municipalities there are boards and trusts composed of members appointed by the State Government and members appointed by various municipal bodies, which are established for the benefit of districts covering areas of two or more ordinary municipalities and are empowered to construct and supervise water works, drainage works and similar undertakings with power to raise money by the sale of debenture stock and levy rates on the assessed value of benefited properties. In New South Wales there are the Metropolitan Board of Water Supply and Sewerage, various Harbor Trusts, Country Water Trusts, and the Metropolitan Fire Brigades Board, on which latter representatives of the fire insurance companies sit who contribute to the upkeep of the brigades.

Local Government in Victoria.— The city council of Melbourne consists of 28 members (seven aldermen and 21 councilors) presided over by the Lord Mayor who is elected annually by the council. Three councilors are elected for each of the seven wards of the city, one being chosen annually by plural voting for a period of three years. The aldermen are appointed by the council and hold office for four years. Residence within seven miles of the city and minimum rating of £10 qualifies for a vote which slides upward to three votes on a £150 assessment.

This State has had a comprehensive system of local government in force for many years which divides it into cities, towns, boroughs, and shires; the councilors are elected by the ratepayers, and the mayors of cities, towns, and boroughs, and presidents of shires by the councilors. The total area under local control being 87,302 square miles, only 582 square miles remaining outside of local government.

Melbourne and 22 suburban municipalities constitute the metropolitan area, and thoughtful students of local government look forward to the time when all or most of these will be amalgamated with the city. A Royal Commission has taken most exhaustive evidence pro and con during the past three years but so far has not submitted its report.

Other governing bodies outside, yet dovetailing in with the municipal councils and the

State Government in Victoria, are the Metropolitan Fire Brigades Board, the Melbourne Harbor Trust, the Tramway Trust consisting of representatives of the Melbourne City Council and 11 other suburban municipalities, the Metropolitan Board of Works controlling water supplies, sewerage and drainage and various other Water Works, Irrigation, and Water Supply Trusts under quasi-local and quasi-State Government control.

Local Government in South Australia.— The council of the city of Adelaide consists of the mayor, six aldermen, and 12 councilors. All of them including the mayor are elected by the ratepayers. The mayor and aldermen hold office for one and three years respectively; the councilors (two for each of the six wards) hold office for two years. At each annual election the mayor, two aldermen and six councilors are balloted for. Plural voting obtains for mayor and aldermen, the system allowing a citizen one vote in each ward where he has property assessed. The State is divided for local government purposes into municipal and district councils. Aldermen may be elected to surburban councils in addition to councilors after a poll of the ratepayers has been taken approving such a proposition, followed by a proclamation by the State Governor, and it is worthy of note that the chairmen of the district councils are elected not by the ratepayers but by the members of the councils. The annual assessed value of property in municipalities is £2,661,238. There are no boards or trusts (other than the Fire Brigades Board) of any importance, but very extensive powers are vested in corporate bodies who may raise loans for the construction and working of tramways, ferries, jetties, water-works, gasworks, electric-light works, baths and washhouses, abattoirs, markets; and make and provide pleasure grounds, libraries, museums, hospitals, and asylums.

Local Government in Queensland.— The city council of Brisbane comprises 14 members who are styled aldermen, one of whom is elected annually to be mayor. The capital value of land is assessed here and not the rental value. The owner or occupier has from one to three votes according to valuation. If, however, the property is valued at less than £120, only the occupier has a vote.

A general system of local government was started in 1878 and revised in 1902. Local areas are divided into cities, towns, and shires. Members of councils are styled aldermen in cities and towns and councilors in the shires. Aldermen and councilors are elected by ratepayers in each area, but all mayors of cities and towns and chairmen of shires are chosen by the members of the councils. The total area controlled by local bodies is 668,252 square miles, leaving only 245 square miles unincorporated.

In Queensland the water supply construction work is undertaken by the State Government and when complete is handed over to the local authorities with attendant liabilities, which become a debt due from the local authority to the State Government which must be repaid in instalments. There are a few bridge boards and harbor boards in various districts.

Local Government in West Australia and Tasmania.— The city of Perth — the capital of West Australia — is governed by a mayor and 15 councilors, all of whom are elected by the ratepayers. For ward elections there are two classes of voters and for general municipal elections four. The local governing bodies in West Australia are termed Municipalities, Water Boards, Road Boards, and Health Boards; the latter may be established within or without municipal boundaries. Members of boards are elected by ratepayers and the chairmen by the members.

In Hobart — the capital city of the island State of Tasmania — the council consists of nine aldermen, one of whom is elected by the members to be mayor. The aldermen are elected by plural voting with a minimum qualification of £8 annual value, the scale being from one to seven votes according to assessed value of property.

Tasmania has its outlying districts governed by Town Boards and Road Trusts. The ratepayers in these districts elect their representatives who are termed "councilors" and these councilors elect their chairman who is styled "Warden."

Powers and Duties of the City Councils.— The functions of the city councils are legislative as well as administrative. They are empowered under statutes granted by the State Parliaments to make by-laws for the suppression of nuisances for all matters of minutiæ relating to good rule and government, and affecting the comfort, convenience, and welfare of their inhabitants. They may levy rates to cover the cost of general administration and raise loans (under certain restrictions) when necessary for public works. Properties exempted from payment of rates are Federal and State Government buildings (including State schools), charitable and benevolent institutions, churches, chapels, and buildings used exclusively for public worship, and buildings privately owned which are used exclusively as schools. They are charged with the control of traffic, the testing of weights and measures, the construction and maintenance of roads, bridges, and footways, the care and management of parks and recreation grounds, public baths, street lighting sheep and cattle markets, meat, produce, and fish markets, abattoirs, the collection and disposal of garbage, trade refuse, and they may and do hold large properties in real estate. They supervise the erection and construction of buildings and in some cities have jurisdiction over theatres, music halls, and places of public entertainment as to fire-proof materials and means of exit. They regulate sky signs and scaffolding and in most cities license cars, cabs, and conveyances plying for hire.

Public Health and Sanitary Functions.— The city councils are constituted as Boards of Health and are responsible in their areas for the proper administration of the various public health acts to the State Boards of Health or Government Commissioners as the case may be. They inspect and license private hospitals and maternity homes and employ medical officers of health and staffs of inspectors (male and female) whose duties are to look after the adulteration of food and to have the oversight of food supplies (particularly meat, milk, and bread), inspection of common lodging houses, dairies, milkshops and dairy cattle; noxious trades and businesses,

abatement of common nuisances and smoke nuisances; to prevent spitting in the streets and in public vehicles; to inspect restaurants, fishshops, butcher shops and all premises where food is prepared or consumed; to prevent overcrowding of premises; and to attend to matters of isolation, disinfection, and hospital accommodation for infectious diseases and fevers.

Notification of disease is generally compulsory under penalty. Medical practitioners, heads of families, and relatives are all liable for neglect. In compulsory notification of pulmonary tuberculosis (consumption) the State of South Australia has led the way, and the difficulties and dangers feared by some medical men have been found to be mythical and non-existent.

Budget Items and Flotation of Loans.— The chief sources of municipal revenue are income from rates, rents from real estate, market dues, fines, penalties, and license fees.

The rates levied in the city of Adelaide may be taken as typical of Australia and are as follows: General purposes, rate, one shilling in the pound; street lighting, rate, three pence; parks and gardens, rate, one halfpenny; rate for sinking funds (loans), one halfpenny; rate for police purposes, two pence; and a sanitary rate of three pence. To which must be added a water and sewerage rate of one shilling and sixpence in the pound (levied by the State Government), making a total of three shillings and three pence to be paid by the citizens, which in comparison with the rates charged in London and most of the large populous cities of Great Britain is an exceedingly light impost.

The expenditure budgets of the cities contain as principal items: road and footway maintenance, upkeep of parks and gardens, baths, markets and kindred establishments, salaries and wages. Day labor invariably obtains except on new construction work. The wage of the ordinary unskilled municipal laborer is on an average seven shillings per day — in some cities slightly higher.

Loans are mostly raised by the sale of debenture stock, redeemable at due dates, although in some instances the State Government advances money and becomes the creditor of the local authority. In Sydney and Melbourne, bills are passed by the State Parliaments authorizing those cities to float loans for street construction work, establishment of electric light, erection of markets, etc. In Victoria, outside the capital, the limit of indebtedness for municipalities is fixed at 10 times the amount of annual income; the establishment of a sinking fund is obligatory with an annual appropriation of not less than two per cent of the amount of the debt. A law similar in many respects exists in West Australia. A referendum of any proposed loan may be demanded in Victoria and the consent of the State Governor is required in West Australia.

In New South Wales municipalities may borrow on debentures, with the sanction of the State Governor, any sum not exceeding the total estimated amount of revenue for an ensuing five years.

In South Australia the consent of the ratepayers is required preparatory to floating any loan, the maximum indebtedness of a municipality is fixed, sinking funds are compulsory, and where the loan is to be applied to works of a non-revenue producing character, a rate must be struck to provide sinking fund and interest.

Statistics of the Metropolitan Cities.— In any survey of the progress of modern civilization the concentration of population in cities is the most startling fact. It is a world-wide movement and is nowhere more strikingly exemplified than in the cities of Australia. The progress of the chief cities has been remarkable and has no parallel among the cities of the old world. Even in the United States the rise of the great cities has been accompanied by a corresponding increase in the rural population, but in Australia (perhaps for the first time in history) is presented the spectacle of magnificent cities growing with marvelous rapidity and embracing within their limits one third or more of the population of the States of which they are the seat of government.

The population and annual assessment value for rating purposes of the metropolitan areas are illustrated in the following table:

	Population.	Annual Value.
Sydney	511,030	£5,669,670
Melbourne	501,460	4,489,181
Adelaide	168,066	1,201,996
Brisbane	124,463	1,167,135
Perth	46,400	378,266
Hobart	34,917	175,194

City Functions Controlled by the States.— The police, although supervising traffic and administering city by-laws and regulations are controlled and paid by the State governments with the one exception of South Australia where the city and all other municipal corporations are compelled to contribute a moiety of the cost in each district. Education is invariably State controlled although private schools exist. The care of the poor is attended to by the States side by side with religious and philanthropic institutions. Prisons, asylums, and hospitals are under the charge of the central governments, although the local authorities are compelled to pay for the accommodation in some States of indigent cases of infectious disease. The cities generally take no share in the management of public libraries, museums, technical schools, and art galleries which exist in every capital. Telegraphs and telephones are entirely controlled by the Federal Government. Tramways (street railways) are in the hands of the State Government in New South Wales and in the other capitals are owned and operated by private companies, under charters granted by the State Parliament. Provision is, however, made in some States, notably in Melbourne and Perth, for the metropolitan municipalities eventually taking them over. Gasworks and supplies are mostly owned and operated by private companies. Electric lighting is owned and operated municipally in Melbourne and Sydney. In Adelaide the private company's existing rights expire in 1908. Fire brigades are managed by boards, with municipal representation upon them. Water and sewerage are managed either by State Government departments or quasi-government boards.

The Municipal Outlook for the Future.— The municipal limits of the capital cities of Australia by no means correspond to their social, industrial, and economic boundaries; as municipal centres they are the «pulses» which contain only a fraction of the population of the metropolitan areas and are only just now waking up to the necessity of bringing into being comprehensive Greater Sydneys, Greater Bris-

banes, Greater Melbournes, and Greater Adelaides. The same sociological forces are at work in Australia as in America, Great Britain, and the continent of Europe, where enlargement of areas and greater cities have been dominant planks in municipal platforms for years. We may therefore expect similar results to follow in Australia as have been achieved elsewhere in the course of the next decade.

Some small effort in this direction has already been accomplished, notably in Brisbane and Melbourne, by the recent absorption of one or two adjacent suburbs, but the movement generally can hardly be said to have yet passed much beyond the embryonic stage.

In the metropolitan areas of Sydney, Melbourne, and Adelaide there are respectively 41, 22, and 19 municipal governing bodies with bewildering codes of by-laws and methods of administration, and it has been well said that on the score of economy alone the arrangement is an absurdity which tolerates within a 10-mile radius of the centres such an enormous number of local governing bodies — each separate, distinct, and independent of the other — to manage the affairs of from 160,000 to half a million of people with, of course, as many staffs of municipal officers, all working in isolation, and often unable to agree about matters of vital concern to all. Experience has shown that occasional conferences are at best but an inadequate substitute for a permanent body with a fair representation of all interests and smoothly working machinery. Whether reform takes the shape of federation or unification, whether it comes with a rush or gradually, as the dwellers outside the city bounds awaken to the advantages of co-operative effort — come it must, in order to permit the carrying out of works at present impracticable, such as the control and working of tramways, gas and electric light concerns and kindred undertakings. With the example of the London County Council before us it is obvious that it pays to concentrate as much as possible the municipal work of cities in one central body. Lord Roseberry has said that "the larger the sense of municipal responsibility which prevails the more it reacts on the community itself. And men outside the municipality, or who have hitherto held aloof from municipal government when they see the higher aims of which the municipality is capable, when they see the wider work that lies before it, when they see the incomparable practical purposes to which the municipality may lend its great power, are not inclined any longer to hold aloof." The broad policy of the London County Council is proof of this where the finest intellects in England take their share of the work in common with those who are attracted to the Council of the Nation at Westminster.

Notwithstanding its shortcomings the development of municipal government in Australia exhibits an upward and progressive tendency. The cities have always been free from that gross corruption which has been such a marked feature and has wrought such pernicious results in some other countries. Municipal government in Australia stands for probity and purity and as a recent Australian writer in 'The Annals' of the American Academy has put it: "We are undoubtedly further advanced to-day than we were 20 years ago, and we may reasonably hope that the silent evolution which is working out its eternal purposes in the social, as truly as in the physical world, will equip us for the achievement of higher things in the future."

T. G. Ellery,
Town Clerk of Adelaide, South Australia.

8. Australia — Education. Formed, like the United States, by the union of previously autonomous communities, the Commonwealth of Australia has followed the example of the United States in the distribution of powers between the Federal and State authority. That is to say none but enumerated powers have been conferred upon the Commonwealth, and all unenumerated powers remain in the hands of the originating states. Thus education, not being among the enumerated powers, is retained, as in the case of America, by the individual States. Every man, and in recent years, every woman, possesses, after registration, a parliamentary franchise, and it is customary to subject knotty public questions to a direct referendum of the people of a State. Such a degree of democracy could exist only in a highly enlightened community. Elementary education, therefore, being essential for the exercise of the duties of citizenship which are imposed upon all, is compulsory, and the corollary follows that it is in almost every case free; otherwise the school fees would amount to a poll tax on children, which in a country crying out for population is the most undesirable of imposts. Being for the benefit of all and not of any sect, state education is secular; and this not from any disregard for religion, but because experience has proved that when the state concerns itself, with dogma strife rather than religious amity is produced. Education was in the early days of each colony left to private enterprise. Before long, however, it was recognized, consciously by some and instinctively by the majority, that a function so essential to the general welfare must be regarded as a duty of the state. So it came to pass that education was one of the first matters of public concern to be included in the ever widening of the sphere of state activity which is the most characteristic movement of the present age. Primary education is accordingly throughout Australia undertaken by the several governments.

There is a general resemblance in the conditions which those who settle in new countries are called upon to face. The problems of education in Australia are very similar to those in America. The circulars of information issued by the bureau in Washington have been of the greatest assistance to the educational departments in Australia, and several useful reforms have derived their inspiration from this source. The laws relating to education in the Australian states, as might naturally be expected in adjacent communities springing from the same stock, bear a strong family likeness; but as considerable intervals intervened between the dates of colonization, and as the science of education was steadily progressive, the system adopted by each state was colored with the views which obtained at the date of its foundation. The older colonies had, therefore, a more difficult task in bringing the laws into conformity with improved methods than those which at a later period were established on ground unencumbered. All have, however, now

come into a fairly uniform line. The sequence of evolution has been the same, although the successive steps taken were independent and not simultaneous. In the beginning of each colony the first schools were established by the churches, aided by government grants. Soon, however, state non-sectarian schools were established and the subsidies to private schools ceased. The state schools were in the first instance placed under the control of a Board of Education appointed by the government; but the basic British idea of responsibility to Parliament asserted itself, and a cabinet minister was vested with the powers previously exercised by the board. The Minister of Education or of Public Instruction, as he is sometimes termed, appoints and dismisses teachers and officers, arranges the curriculum and controls the whole department. Regulations framed by him and approved by the Governor in Council acquire the force of law after they have been laid before Parliament. This centralized administration is mitigated, and to some extent, assimilated to local conditions, through the agency of district inspectors and local boards of advice. The funds necessary for education are derived from the general revenue. From time to time attempts have been made to place a portion, at least of the burden upon the local rates, but it is felt that the cost of a system designed for the benefit of the public at large should be met from a source to which, either directly or through the customs, all contribute. In New South Wales and Tasmania fees are still levied, but in the former these amount to only a fraction of the whole expenditure, and are about to be abolished; and in the latter there are free schools in the large towns. The net yearly cost to the State of primary instruction per scholar in average attendance, excluding the cost of school premises, varies from £3.9.1 to £4.17.3. The average of all six States being £4.4.9.

The statutory school age is in New South Wales and Western Australia from 6 to 14 years; in Victoria from 6 to 13; in Queensland from 6 to 12; in South Australia and Tasmania from 7 to 13. Pupils under the maximum age are exempted from further attendance if on examination they pass a prescribed standard. Attendance is required in New South Wales on 70 days, and in Queensland on 60 days in each half year; in South Australia on 35 days in each quarter, and in central districts on 8 out of 10 school sessions in each week; in Victoria on 75 per cent of the days in each quarter; in Western Australia and in Tasmania on every day on which the school is open. As a rule, children under the age of nine, living within a radius of two miles by road from a state school, and those between nine and the maximum age living within a radius of three miles, come under the laws relating to compulsory attendance. Truant officers and in some cases the police are employed to enforce the law. Prosecution and punishment of the parents of defaulting children is when necessary resorted to without hesitation.

State schools in Australia come under the category of Public, Provisional, Half-time, and Special. In most of the States a public school may be established if an average attendance of 20 can be maintained. The buildings are provided by the department. In Queensland an average attendance of 30 is required, and the locality has to contribute one-fifth of the cost of erection and maintenance of the building. Where the average attendance is under 20, but over 12, the school is termed provisional. In sparsely populated districts half-time and special schools or itinerant teachers are provided. The policy of concentration of attendance has been largely carried out, children are carried free to and from school over the state railways in New South Wales and in Tasmania. In Victoria they are carried at reduced rates. It is not unusual to see a passenger train stop at cross roads to pick up a group of children on their way to or from school. In many cases it is found to be more economical to make an allowance to parents for the conveyance of children to a school than to bring a school to the children. Moreover, better schools can be provided and higher standards maintained under the «conveyance» system which there is a disposition to extend. The schools will then still better serve the purpose of central or consolidated schools. The average attendance of pupils at the state schools is at the rate of about 62 per school, 30 per teacher, and 11.51 per cent of the population; the average enrolment being 15.59 per cent.

Normal schools are provided for the training of teachers, and are usually recruited from those who have served for four years as pupil teachers. In South Australia a six-year course has been arranged for the training of teachers; two years are spent in study combined with a certain amount of practical work; two years in teaching in the schools, and the final two years at the University. During the term of training the students receive a maintenance allowance of from £30 to £80. The schools are classified according to the number of the children in average attendance, and progressive grades of certificates are awarded to teachers which qualify them for appointments in the public schools. Uncertificated teachers are frequently employed in the provisional schools. In all the states with the exception of New South Wales, there is a preponderance of female teachers. The salaries of male head teachers range upwards to £450, and of female head teachers to £360. Male assistants receive from £60 to £262, and female assistants from £50 to £216. The salaries of provisional teachers run from £66 to £140. Payment by results has proved unsatisfactory in operation and has been practically abandoned. The system of inspection is less mechanical than formerly and several of the States exempt schools of recognized excellence from detailed examination, leaving the promotion of the scholars in the hands of the head teacher. Boards of Advice visit, inspect and report upon the schools in their district, are authorized to expend small sums on the school buildings, arrange for the use of the buildings out of school hours, and take part in the administration of the compulsory clauses of the Education Acts. The Boards of Advice are honorary. In some cases they are nominated by the Executive, in others they are wholly or partly elective. In Queensland there is usually a committee for each school. In no case, however, has the theoretically desirable association of the official with a public body on each plane

been achieved; viz., a school committee acting with the teacher, correlated with a Board of Advice co-operating with the District Inspector, and a Central Council stimulating, assisting, aid, if need be, acting as a check upon the Minister. Education falls short of its object if the Department does not carry parents and the locality along with it. The schools, when the public sympathizes with their work, exercise a vitalizing and elevating influence on the whole neighborhood. There is no caste system in Australia. The state schools are intended to meet the requirements of rich and poor alike; it is not uncommon to see the child of a cabinet minister, or of a wealthy citizen imbibing the elements of knowledge by the side of the child of an artisan or laborer.

The education in the state schools is practical and is now designed as a preparation for the actual requirements of modern life rather than for the conditions that obtained in the Middle Ages. The pupil is led by carefully graded steps from the known to the unknown; from the particular to the general; from the concrete to the abstract; «from the microcosm of the school to the macrocosm of the Universe.»

The tendency is to subordinate theory to practice. Language is taught before grammar; religious conduct precedes dogma. Kindergarten methods, local geography, nature study, drawing, clay modelling, and manual training are taking the place of purely literary studies. History as now taught in Australia is less concerned than formerly with the character of mediæval kings, it is studied more with the view of inculcating patriotism, civic duties and responsibilities. Since the contingents from Australia bore arms with comrades from the mother country and the cementing power of kindred blood shed in common cause has been realized, the Union Jack is saluted in the schools of the Commonwealth as is the Star Spangled Banner in those of the United States. Arbor Day was instituted in the schools of South Australia in 1887, and the celebration has become general throughout the States. On this day the ordinary school work is suspended. The children assemble in the morning, and, in the presence of the Mayor, or Chairman of the Board of Advice and other visitors, plant trees with some ceremony. After a few speeches and some words as to the care of trees and their usefulness, the school is dismissed and the rest of the day is enjoyed as a holiday. All new country schools in South Australia are surrounded by a reserve of several acres. Some of the schools adopt practical agriculture as a form of manual training, and in all the States, teachers are encouraged to make, with the aid of the children, gardens around their schools.

In some of the States there are Manual Training Centres at which pupils drawn from the surrounding schools receive instruction from special teachers. In South Australia the ordinary teachers are encouraged to qualify themselves in this branch of education. The greatest latitude is given as to the form of the instruction; for that subject is taught best in which the teacher feels the deepest interest. Chip carving, joinery, brush making, book binding, and wire work are among the subjects taken up in the various schools. Domestic economy and cookery are taught to girls in most of the States. Calisthenic class exercises to a musical accompaniment are commonly adopted as an attractive form of physical training. The pupils are taught by drill to move in masses and the order is occasionally given for fire parade. The Cadet Corps are under military supervision. Rifles are supplied to the boys, but they have to provide themselves with an inexpensive uniform. Swimming is taught in some of the schools. The teaching of singing by the tonic solfa method is a prominent feature. The principles of morality are sedulously instilled, and good manners cultivated. Special attention is given to temperance lessons in almost all the States.

The average minimum time devoted to secular instruction is four and one-half hours each day. This stipulated condition being fulfilled certain facilties are provided for imparting religious instruction. In New South Wales and Western Australia the word «secular» is held to include religious teaching of a general as distinguished from that of a dogmatic character; and the teachers in the performance of the ordinary day's duty give Scripture lessons based on those issued by the Commissioners for National Education in Ireland. In South Australia, if the parents at any school so desire, teachers may be required to read without note or comment a portion of Scripture for a quarter of an hour before the ordinary work begins. In Victoria and Queensland no teacher is allowed to give other than secular instruction in a school building. In Victoria, Queensland, and South Australia the buildings may be used for any approved purpose out of school hours. The regulation in Victoria states that half an hour may be set apart in one or two school days in each week for religious instruction by persons other than State school teachers. Such classes must, however, be held either from 9.15 to 9.45 A. M., or from 3.30 to 4 P. M. No substituted secular instruction is to be given to the children who do not attend these classes. In New South Wales and Tasmania one hour a day may be set apart for the use of visiting clergymen or teachers of religion. The time, if not used for this purpose, is devoted to ordinary instruction. In Western Australia half an hour at any time in each day is available for special teachers of religion, subject to as little interference as possible with the ordinary work of the school. In none of the States is a child required to attend any religious lessons without the parents' consent. In South Australia the desire to arrive at a settlement of the vexed question of religious teaching in State schools led to the following resolution being carried in the House of Assembly 16 Dec. 1895: «That in the opinion of this House a poll of electors should be taken on the following questions: Do you favor (1) The continuance of the present system of education in State schools? (2) The introduction of Scriptural instruction in State schools during school hours? (3) The payment of a capitation grant to denominational schools for secular results?»

The poll was taken at the general election in April 1896, and resulted in the following answers: Question No. 1: Yes, 51,681; no, 17,819. Question No. 2: Yes, 19,280; no, 34,834. Question No. 3: Yes, 13,349; no, 42,007. Informal, 12,830. The referendum

thus initiated has since been adopted for the solution of various questions in Australia.

Secular education does not satisfy the requirements of the Roman Catholic Church, which, therefore, in populous centres, maintains separate schools. In some of the States private schools are officially inspected. There are but few evening schools; little public requirement in this direction has so far been manifest. But continuation schools have been fairly successful in Western Australia.

Although as has been seen above Primary education is chiefly a State function, this is not the case with secondary education. With few exceptions the secondary and high schools for both sexes are private or denominational establishments. The higher classes, however, in the State schools include subjects usually regarded as secondary. Provision is made by means of exhibitions, scholarships, etc., to enable bright and successful pupils from the State schools to continue their ascent, free of charge, up the educational ladder, through the high schools and at the universities. In New South Wales children who reach the highest class in the public schools may receive advanced instruction including Latin and French for 3d. a week, and the Department maintains four high schools, two for girls and two for boys. The Sydney Grammar school receives an annual grant from the State, as does also the high school in Perth. Queensland liberally subsidizes secondary schools. In South Australia there is an Advanced school for girls which, although a State institution, is largely supported by fees. There is also in Adelaide a secondary State school for boys which is preparatory for the School of Mines and Industries, and the Agricultural College. The distinctive feature of this school is that only half of each day is spent in the class rooms, during the other half the pupils receive practical instruction in the garden, the laboratory, and the workshop. In Victoria extra and advanced subjects are taught in many of the public schools for a small fee. The Chambers of Commerce, the Bankers' Institute, and the Incorporated Institute of Accountants hold periodic examinations in commercial and allied subjects which have a stimulating effect on this branch of education. There are private schools in each of the capitals which provide a commercial curriculum. Technical education, being a special need in a new country whose resources are only partially developed, is largely undertaken by the State. In the cities and in many of the towns, schools of design, schools of mines and industries, technological museums, and workingmen's colleges abound. There are also numerous agricultural colleges. In several of the States technical schools have been built and equipped by private munificence.

In the capitals are art galleries containing many works by famous modern artists and sculptors. In connection with these are fine art schools where instruction in painting, sculpture, art needlework, and allied subjects reaches a high standard. These are as a rule controlled by Boards, in some cases partly appointed by the Government and partly elected. The University of Sydney was established in 1852, and that of Melbourne in 1855. South Australia followed in 1874 the example thus set and Tasmania founded a university in 1890. These universities are supported by grants from the public chest, by public and private endowments, and by fees. The Australian universities do not confer degrees in divinity; otherwise they resemble and are in no way inferior to those of the old world. The universities in Adelaide and Melbourne grant degrees in music, and each has a fully equipped conservatorium of music. In all the universities women are admitted to degrees and to the full privileges of graduates. The universities of Sydney, Melbourne, and Adelaide grant degrees in medicine to both sexes.

JOHN ALEXANDER COCKBURN,
Formerly Minister of Education in South Australia.

9. Australia — Religion. There is no established Church in Australia. All religions are now on an equal footing so far as the Governments are concerned; grants in aid were formerly given to the leading religious bodies, but one by one the States relinquished the practice. South Australia led the way in this abolition in 1851, a few years after the foundation of the Colony. Queensland, in 1860, shortly after the assembling of its first parliament, limited future payments to the clergy actually in receipt of grants; New South Wales followed suit in 1862 and Victoria in 1875. Western Australia voted periodical subsidies until 1895, when future annual payments were commuted by the distribution of two grants of £17,715 each in that and the following year among the Anglican, Roman Catholics, Wesleyans, and Presbyterians, which are the only denominations that have received state aid in recognition of their religious work. The members of these four churches constitute the great bulk of the population and their relative numerical strength has remained almost constant for the last 30 years. The Commonwealth is debarred from legislating in respect to religion. Clause 116 of the Constitution Act provides that: "The Commonwealth shall not make any law for establishing any religion, or for imposing any religious observance, or for prohibiting the free exercise of any religion, and no religious test shall be required as a qualification for any office or public trust under the Commonwealth". In the convention which framed the Federal instrument after long and earnest debate the words "humbly relying on the blessing of Almighty God" were inserted in the Preamble to the Act in recognition of the deeply religious sentiment of the people. At the census of 1901 the numbers of adherents of the various denominations in each State of the Australian Commonwealth were given as follows:

Church of England	1,497,570
Roman Catholic	855,709
Presbyterian	426,105
Methodist	504,139
Baptist	92,670
Congregational	73,561
Lutheran	75,021
Salvation Army	31,100
Unitarian	2,629
Other Christian	66,968
Jew, Hebrew	15,239
Mahometan	3,206
Buddhist, Confucian	16,105
Hindoo, Brahmin	846
Other Non-Christian	18,894
Freethinker, Agnostic, etc	10,402
Indefinite	479
Others	80,673
Total	3,771,715

Australia was originally included for ecclesiastical purposes in the province of Canterbury and up to the year 1836 was attached as an Archdeaconry to the diocese of Calcutta. For 15 years after the foundation of New South Wales the only denomination recognized by the Government or possessing a Minister was the Church of England. There is now a general Synod of this church which meets every five years under the presidency of the Archbishop of Sydney, who has the title of Primate of Australia, although each State preserves its autonomy in church affairs. Melbourne and Brisbane also have Archbishops. There are six dioceses in New South Wales; five in Victoria; four in Queensland, together with that of New Guinea; and two in Western Australia. There is also the diocese of Adelaide in South Australia and of Tasmania. The Roman Catholic Church occupies, so far as numbers are concerned, the second place in each of the States, with the exception of South Australia, where the Methodists are numerically stronger. Its organization in Australia as elsewhere is superb. At the head of the Church stands the Cardinal Archbishop of Sydney. There are Archbishops in Melbourne, Brisbane, Adelaide, and Hobart; and 14 Bishops in the six States. Until 1834 Australia, so far as the Roman Catholic Church is concerned, was under the Bishop of Mauritius. Sydney was in that year constituted a see; eight years later the prelate was invested with the title of "Archbishop of Sydney and Vicar Apostolic of New Holland." In 1885 the Archbishop of Sydney was created a Cardinal and placed at the head of the Roman Catholic Church throughout Australasia. In 1876 Melbourne was made an Archdiocese as were also Adelaide and Brisbane in 1887, and Hobart a year later. The Cathedrals of Saint Mary in Sydney and Saint Patrick in Melbourne are especially magnificent structures. The Roman Catholic Church takes a prominent part in furthering social and industrial legislation and in temperance work. The Wesleyan Methodist Church was established in New South Wales in 1812, at a class meeting attended by 12 persons. Up to 1855 this Church was regarded as a Mission, but in that year it was constituted an affiliated Conference. In 1873 the Australasian Wesleyan Church was raised to the rank of an independent conference. On 1 Jan. 1902, the Wesleyan Methodist, the Primitive Methodist, and the United Methodist Free Churches of Australia and New Zealand were united under the name of the Methodist Church of Australasia. In South Australia this Church includes 25 per cent of the whole population and throughout Australia its members form a compact, enlightened, and progressive body, which has exercised a preponderating influence in promoting temperance legislation and measures tending toward a high plane of morality. The Presbyterians erected in 1810 one of the first places of worship in New South Wales. The Presbyterian Churches in all the States are united under the title of the Presbyterian Church of Australia in a General Assembly which meets every year in the capital cities in rotation. The Church in each State, however, acts independently in local administration and is autonomous so far as property is concerned. There is a Union of the Congregational Churches in each State federalized in the Congregational Union of Australasia. Thus pervading the Churches and leading to interstate Unions, is witnessed the same synthetic spirit which was materialized in Australian Federation. By this means strength is acquired without the sacrifice of local liberty, for a Federal union combines firmness with flexibility.

The youngest and one of the most active religious bodies in Australia is the Salvation Army. It started in South Australia in 1880 and two years later officers were sent from Adelaide to organize forces in Victoria, New South Wales, and Tasmania, and in 1886 to Queensland; operations in Western Australia were commenced in 1891. At first the officers of the Army met with much ridicule and some ill-treatment but the earnest and effective manner in which they grappled with the problems of social reform soon reconciled the public to their methods. Persecution gave way to popularity, and the work of the Army is now applauded by all classes. The Prison Gate Brigade reclaims many criminals, and does such good service in diminishing crime that several of the State Governments give a grant in aid of its operations. The headquarters of the Army are in Melbourne and the officer commanding in Australia has the rank of a Commissioner. There are Colonels or Brigadiers in each State.

The several churches in Australia are animated by those friendly and tolerant sentiments which are the natural offspring of freedom. An interchange of pulpits is not infrequent. On Empire day in 1906 a special service was arranged at Saint Paul's Cathedral, Melbourne, in which the president of the Methodist Conference and the minister of the principal Presbyterian Church took part.

John Alexander Cockburn,
Formerly Minister of Education in South Australia.

10. Australia — Industries and Commerce. *Manufactories.*— For many years Australia relied chiefly on its raw products for its wealth, but recently steady progress has been made with its manufacturing industries, and at the present time 152,260 men and 50,638 women find employment in what are ordinarily termed factories, as well as a large number of others in smaller establishments.

The most rapid increase in the manufacturing industry has taken place during the past 10 years—in fact between 1894 and 1904 the hands employed increased from 133,631 to 202,898, an increase of 69,267, as compared with an increase of only 28,366 during the previous 10 years, the growth of the factory employees being proportionately far greater than that of the population.

As regards the manufacturing industry generally, the population of the continent is at present hardly sufficient to maintain a large manufacturing population, while its distance from other market places is at some disadvantage as regards the export of manufactured products. The total horse-power of machinery used in the factories amounts to 160,000, the increased use of electricity in recent years being accountable for a rapid addition in such power.

The following table shows the number of establishments and the hands employed in each state of the Commonwealth in factories and works employing four hands and over:

Class of Industry.	Hands employed
Leatherware, not elsewhere included	566
Minor wares, not elsewhere included	1,884
Total	202,898

	New South Wales.	Victoria.	Queensland.	South Australia.	West Australia.	Tasmania.
Establishments	3,632	4,208	1,909	1,339	607	431
Employees	68,036	76,287	20,058	18,044	12,159	7,714

It will be seen from the above table that Victoria, which was the first state to display activity in the manufacturing industry, employs the greatest number of persons, and of these 25,429 are employed in establishments employing from four to 20 hands, 25,042 in establishments employing from 21 to 100 hands, and 25,816 in factories employing over 100 hands.

The capital invested in Victorian factories amounts to a little over £20,000,000 sterling, including the value of the land, buildings, machinery, plant and sundries. The capital invested in New South Wales factories amounts to £21,000,000. The capital invested in the manufacturing industries in Queensland amounts to £9,000,000. According to the census of 1901, the capital invested in the manufacturing industries of the Commonwealth aggregates £65,000,000, of which £20,000,000 is represented by land and buildings, £21,000,000 by machinery and plant, and £24,000,000 by stock, material, etc.

New South Wales comes next to Victoria in the employment given in the manufacturing industries, and its total of 68,036 is made up of 53,457 males and 14,579 females. Establishments employing from four to 20 hands employ 19,879; from 21 to 100 hands, 24,797 persons, and over 100 hands, 23,360 hands.

In Queensland the two principal manufacturing industries are sugar refining and meat preserving, and of the total number of people employed, about 12 per cent find employment in these two industries.

The total output of all factories in Australia, exclusive of those engaged in the production of butter, cheese and bacon, figures of which are included in the pastoral industry, amounts to £71,000,000, of which £43,000,000 represents the value of material and fuel used, and £28,000,000 the value added in the process of treatment. Of the latter sum £13,500,000 accrues to the proprietors to pay rent, depreciation, insurance, etc., and profits of the business, and £14,500,000 represents wages paid to the employees.

The following table gives the class of industries which give employment to people in the Commonwealth:

Class of Industry.	Hands employed.
Treating raw material the product of pastoral pursuits	7,122
Oils and fats, animal, vegetable, etc	1,709
Processes in stone, clay, glass, etc	7,904
Working in wood	15,709
Metal works, machinery, etc	37,317
Connected with food and drink, etc	32,754
Clothing and textile fabrics and materials	56,599
Books, paper, printing and engraving	18,019
Musical instruments	282
Arms and explosives	302
Vehicles and fittings, saddlery and harness, etc.	7,959
Ship and boat building, etc	1,826
Furniture, bedding and upholstery	5,396
Drugs, chemicals and by-products	2,110
Surgical and other scientific instruments	134
Jewelry, timepieces and plated ware	1,286
Heat, light and power	4,020

Tanning, fell-mongering and wool scouring afford the largest amount of employment among the industries in class 1, and this can be readily understood, seeing that the pastoral industry is still the greatest in the Commonwealth.

In class 2 the manufacture of soap and candles is increasing rapidly.

In class 3 the manufacture of bricks and tiles is the most important, about 65 per cent of those engaged in this class being employed in that industry.

In class 4 it can be readily understood that with the immense forests of valuable timber, the saw mill is the most important of wood-working establishments, and about 70 per cent of those employed in that section are in saw mills.

Class 5 included a great number of persons employed in the engineering works of the respective state government railway and tramway workshops. Also workers in smelting establishments for the extraction of ore, though these employed in quartz batteries are not classified as factory hands in Australia. There are several important establishments for the manufacture of agricultural implements, and at Gawler, in South Australia, and in Melbourne, the capital of Victoria, important agricultural implement works have been founded. To an Australian firm is due the credit of inventing that great labor-saving appliance, the "Complete Harvester."

In industries connected with food and drink butter, cheese, meat preserving, sugar mills, and breweries employ a great number of hands, while flour mills, ærated water factories, biscuits and other articles required for local consumption also employ a great number of persons.

Factories connected with clothing and textile fabrics offer more employment than any other section, and here the females employed largely outnumber the males. Victoria shows the greatest development in this industry, and during the last few years the manufacture of wool has made considerable progress in the various states.

Perhaps a more interesting comparison will be found in arranging the industries into three natural classes: (1) Those which come into competition with imported goods; (2) those dependent upon the natural resources of the Commonwealth, and (3) those treating perishable products for domestic consumption. We find that the first section employs 88,866 people, the second 102,206, and the third 11,826.

Speaking of wages generally, Australia pays its employees high wages compared to other countries, while the genial climate and general healthy conditions of life makes living cheap compared to other countries of the world.

During the last few years a system of in-

dustrial legislation has come into force in most of the states, which brings about better conditions of work, cleanliness, air space, sanitation, etc. Australian factories, as a rule, are well built and roomy. The day's work is generally limited to eight hours, with extra payment for overtime in cases of need. Wages boards have also been appointed for many of the principal industries, and to prevent strikes and lock-outs, courts of conciliation and arbitration have been established.

Taking the chief manufacturing state of Victoria as a basis, the latest records show that in industries controlled by wages boards, the average earnings of male workers, 21 years old and upwards, is £2 4s. 3d. per week, and of females, 19s. 9d. per week. The average wage in industries not so regulated, being £2 1s. 11d. and 17s. 5d., respectively.

Pastoral Industry.—The pastoral industry plays the most important part in the resources and wealth of Australia. At the close of 1904 Australia had 65,822,918 sheep, 7,868,520 cattle, 1,595,256 horses, and 1,062,253 pigs. The 1905-06 figures are not at present available for all the states, but judging from those available it may be safely estimated that the sheep show an increase of about 14 per cent on the figures given and now number 75,000,000; cattle show an increase of 8 per cent, now numbering 8,500,000, and horses an increase of 5 per cent, numbering 1,675,000. In swine, the figures are probably about the same.

Nothing is more marvelous than the progress of the pastoral industry. In the year 1800 there were only 6,124 sheep, 1,044 head of cattle, 203 horses, and 4,017 pigs in the whole of Australia, but it is since 1850 that the greatest progress has been made, and from that date the value of the wool alone which has been exported has amounted to £650,000,000 sterling.

The first sheep imported were from the Cape of Good Hope, and in 1823 and 1825 further lots of Spanish sheep were introduced. In some respects the climate of Australia changed and improved the character of the Spanish fleece. The wool became softer and more elastic and increased considerably in length. The average weight of a fleece has increased remarkably, and while in 1861 the average weight of a New South Wales fleece was only 3.28 pound per sheep, the present average weight is 7.3 pound.

In recent years there has been a tendency to divide the sheep into smaller flocks. In New South Wales for instance there are 17,361 sheep owners as compared with 14,033 ten years previous, while the average size of a flock is now 1,650 as against 4,050 at a former period. Of the total number of the sheep in Australia about 95 per cent are merinos. On the coastal districts, however, where merino sheep do not do so well, the rearing of cross-bred and long wool sheep is increasing and these are specially valuable for the meat they produce. It is interesting to note that at the present time Australia carries one-fifth of the total sheep in the world.

The export of wool brings an immense amount of money to the Commonwealth and the 1904 return for each state was as follows:

New South Wales	£9,328,270
Victoria	3,376,015
Queensland	2,280,909
South Australia	£1,306,238
West Australia	419,395
Tasmania	401,512
Total	£17,112,339

Cattle.—Owing to the more profitable character of sheep farming, cattle breeding in the Australian states is, with the exception of Queensland, second to that of sheep. The following table shows the number of cattle in the various states at the end of 1904:

New South Wales	2,167,129
Victoria	1,694,976
Queensland	2,722,340
South Australia	520,379
West Australia	561,490
Tasmania	202,206
Total	7,868,520

For the year ending 1905 the cattle in the states for which there are returns had increased by eight per cent and as the season generally in Australia was a favorable one it is safe to assume that in all the states an increase occurred on the returns of the previous year and the present numbers are not less than 8,500,000.

No form of production in Australia has made such rapid strides of late years as dairying and included in the above figures for cattle are the following numbers of dairy cows and heifers:

New South Wales	591,936
Victoria	632,493
Queensland	160,000
South Australia	88,826
West Australia	27,721
Tasmania	50,230
Total	1,551,206

Horses.—Considerable attention has been paid to the breeding of horses and at an early period the stock of colonial-bred horses was improved by the importation of Arabian and other breeds. The following table shows the number of horses in the different colonies:

New South Wales	482,663
Victoria	372,397
Queensland	413,165
South Australia	200,241
West Australia	90,225
Tasmania	36,565
Total	1,595,256

There is a considerable demand in India for Australian horses and as a rule between 6,000 and 7,000 are exported annually to India, valued at from £80,000 to £85,000.

Angora Goats.—Considerable attention has been given during the last few years especially in Queensland and New South Wales, to the production of mohair and considerable numbers of pure bred angoras have been imported from the United States. The goat thrives admirably in the warm dry climate of Australia and it seems likely that in the near future, the export of mohair will show considerable increase. At the present time there are about 65,000 goats depastured in Australia.

Camels.—In some of the states camels are employed for the carriage of wool and other produce. In West Australia camels number 2,150 in New South Wales 850, and in the Commonwealth as a whole the number is not less than 4,200.

Pastoral Returns.—The annual return from the pastoral pursuits in 1904 was about £36,000,000, to which total sheep contributed about £26,000,000; cattle £7,000,000; horses £3,000,000. The greater part of the sheep industry is, of course, the return from wool and skins which amounts to £20,250,000. The value of wool consumed locally is not more than £250,000.

Frozen Meats.—A rapid increase in live stock in Australia in favorable seasons makes the question of disposing of the surplus material of serious consequence. In 1882 the first shipment of frozen mutton from Australia to Great Britain was tried. In 1905 £441,018 worth of frozen beef, £1,081,151 worth of frozen mutton and £338,823 worth of hares and rabbits were exported from Australia over sea.

Queensland exports large quantities of chilled and frozen beef, the total amounting to about £1,000,000 worth annually. Much of this is sent to the other states and is not included in the oversea exports. New South Wales exports chiefly frozen mutton, which varies in value from about £200,000 to £500,000 annually. Victoria also exports large quantities of frozen mutton and beef, while South Australian lambs are highly prized in the British markets. The export of canned meat was valued at £264,000.

Dairy Farming.—The introduction of the factories system at convenient centres in Australia has caused rapid extension in this industry. Immense quantities of butter are now exported to Great Britain, in 1905 the export amounting to £2,307,835 sterling or 11 per cent of the total imports into Great Britain. The total value of the dairying industry of Australia is shown in the following table:

Total Value of Dairy and Swine Produce.	
New South Wales	£2,426,000
Victoria	2,912,000
Queensland	646,000
South Australia	568,000
West Australia	240,000
Tasmania	338,000
Total	£7,130,000

Forestry.—Australia is chiefly famous for its hardwood timbers, the export of which is now a considerable industry. In 1904 the total exports from Australia amounted to £839,518 of which West Australia exported £584,422. The present annual value of the timber industry of the Commonwealth, that is of the rough timber as it leaves the forest saw mills, is about £2,250,000 sterling. In West Australia alone the forests of marketable timbers are estimated to cover about 21,000,000 acres. The Governments of all the States have a number of reserves where the young timber is conserved so that the source of supply can be maintained.

Jarrah is the chief timber exported, its principal use being for wood-blocks, piles, railway sleepers, etc. The wattle tree grows well in most parts of Australia, from the bark of which large quantities of tanning material are produced. There are various species of eucalyptus from which is distilled the famous eucalyptus oil which has a considerable value for medicinal purposes. Some of the fine grained woods are also very beautiful and much used for decorative purposes. The karri is probably the finest tree of the Australian forests and sometimes run to over 30 feet in circumference at three feet from the ground and up to 150 feet from the ground to the first branch. Other prime timbers are ironbark, tallow wood, jarrah, spotted gum, grey box, mahogany, blackbutt, etc. Besides hard woods there are beautiful cabinet woods, viz.: cedar, rosewood, redbean, silky oak, blackwood, etc.

Agriculture.—Judging by the experience of the past 30 years, Australia appears to be on the threshold of vast agricultural developments. Up to 1871 only 2,345,922 acres were under crop in the Commonwealth but in 1904 this had increased to 9,365,022 acres. Of the cultivated land 90 per cent lies within the borders of New South Wales, Victoria and South Australia. The following table shows the area cultivated in the various States:

State.	Acres.
New South Wales	2,674,896
Victoria	3,321,785
Queensland	539,216
South Australia	2,275,506
West Australia	327,391
Tasmania	226,228
Total	9,365,022

As in most new countries where the pioneer farmer needs a quick return from his land, wheat is the principal crop and nearly 67 per cent of the cultivated land is sown to wheat. The area under wheat for grain in the various states in 1904 was as follows:

State.	Acres.
New South Wales	1,775,955
Victoria	2,277,537
Queensland	150,958
South Australia	1,840,157
West Australia	182,080
Tasmania	43,091
Total	6,269,778

In 1905 the yield of wheat for the Commonwealth amounted to 68,000,000 bushels, but the figures showing areas under crop in 1905 for the various states are not at present available. The other crops of most importance are hay, oats and maize, 1/6 of the cultivated area being under hay, 5.2 under oats and 3.5 under maize.

The Commonwealth requires about 30,000,000 bushels of wheat annually for home consumption and seed and a production of 65,000,000 leaves about 35,000,000 bushels annually for export.

The average yield of wheat in Australia may be taken at about 10 bushels per acre. This appears low judging by the standard of many other countries, but a bare statement of averages is misleading, as in Australia the cost of production is relatively very low. In ordinary districts the expenses of ploughing seed and sowing and harvesting the wheat amounts to only about 12/-per acre, so that a yield of 10 bushels at 3/- a bushel means a return of about 18/ an acre out of which to pay the other expenses.

In South Australia the conditions of cultivation are even more favorable than the above indicates, and with a smaller yield, wheat growing is bound to be very profitable. The present comparatively low yields are largely due to the fact that immense areas are put under crop by individual farmers. In consequence, the cultivation and harvesting methods are not carried out so thoroughly as in older countries of the world. With smaller areas and better farming, far higher averages will, it is believed, be ob-

tained in the future. The following tables show the average area and yield of some of the other principal crops:

AREA UNDER OTHER PRINCIPAL CROPS.

State.	Maize.	Oats.	Other grain crops.	Hay.	Potatoes.	Sugar cane.	Vines.	Other crops.
	Acres.	Acres.	Acres.	Acres.	Acres.	Acres.	Acres.	Acres.
New South Wales	193,614	40,471	23,120	435,704	23,855	21,525	8,840	151,812
Victoria	11,394	344,019	59,879	452,459	45,912	.....	28,016	101,569
Queensland	119,171	643	17,746	48,740	12,754	120,317	2,194	66,693
South Australia	.....	50,630	30,982	269,626	8,315	.....	23,210	52,586
West Australia	86	13,864	4,377	105,247	1,906	.....	3,413	16,418
Tasmania	149	43,690	24,077	55,545	25,948	.....	.....	33,728
Total	324,414	493,317	160,181	1,367,321	119,690	141,842	65,673	422,806

AGRICULTURAL PRODUCTION.

State.	Maize.	Oats.	Other grain crops.	Hay.	Potatoes.	Sugar cane.	Wine.
	Bushels.	Bushels.	Bushels.	Tons.	Tons.	Tons.	Gallons.
New South Wales	4,951,132	652,646	334,205	366,293	48,754	199,640	928,160
Victoria	623,736	6,158,929	1,105,822	514,316	92,872	.....	1,832,386
Queensland	2,542,766	15,137	347,738	80,662	33,257	1,326,989	60,433
South Australia	.....	555,696	440,536	294,252	19,521	.....	2,625,430
West Australia	896	226,318	50,396	113,794	5,614	.....	185,070
Tasmania	.....	1,178,819	502,818	73,457	110,547	.....	.....
Total	8,118,530	8,787,545	2,781,515	1,442,774	310,565	1,526,629	5,631,479

Large areas are also under orchards in the various states of the Commonwealth, the total being about 155,000 acres. Victoria heads the list with 51,000; New South Wales 50,000 and South Australia 20,000. The export of apples, oranges and dried fruits to Great Britain has been commenced and promises to develop into an important industry.

All the Governments give considerable attention to agricultural education and have established agricultural colleges and experimental farms where practical and scientific agriculture is taught.

In most of the States also arrangements are made by the Government to advance money to assist farmers at low rates of interest.

Irrigation.—The necessity for providing water for stock and irrigation in the dry parts of Australia induced the respective Governments to spend a good deal of money on water conservation and artesian boring. Cretaceous beds extend over large areas of New South Wales, West Australia and South Australia. By sinking artesian bores supplies of water are brought to the surface from underground sources which exists in the tertiary drifts and the cretaceous beds.

In New South Wales one of these wells has a daily flow of 1,750,000 gallons, the depth of the bore being 2,029 feet. Over 50 artesian bores have been successfully sunk in South Australia, the greatest daily flow amounting to 1,200,000 gallons. These bores give excellent water for stock purposes and are also used in many cases for irrigating crops.

Mineral Resources.—Most metals of economic value are found in Australia. Gold is found in all the states and in 1823 the first discovery of the precious metal was made. In 1851 and 1852 important discoveries were made in New South Wales, Victoria, South Australia and Tasmania and attracted a rush of population. A little later gold was found in Queensland and the last of the states in which extensive deposits were found was Western Australia. So important did these deposits prove that in 1905 the output of Western Australia was more than equal to all the other Australian states together.

The following table shows the gold won in each State up to the end of 1905 and the return for the individual year of 1905:

	Total Yield, £	1905. Ounces.
New South Wales	53,235,286	274,267
Victoria	272,801,158	732,603
Queensland	61,618,291	578,364
South Australia	2,778,392	20,447
West Australia	62,686,475	1,955,304
Tasmania	6,026,845	74,316
Total	459,146,447	3,635,301

Silver.—Australia is rich in silver and it is found in all the states either alone or in the form of sulphides, chloride, bromide, iodide, chloro-bromide of silver and antimonial and arsenical ores and argentiferous lead ores. In the latter the largest deposits of metal are found.

Prior to 1882 the output of silver in Australia was small, but with the opening up of the Barrier Mines at Broken Hill, close to the boundary of New South Wales and South Australia, rapid advances took place. The following table shows the output of silver and silver lead in the respective state up to the close of 1904:

State.	Silver and silver-lead.
New South Wales	£37,348,699
Victoria	198,793
Queensland	995,583
South Australia	141,848
West Australia	85,887
Tasmania	3,436,546
Total	£42,207,356

Of the above about £29,000,000 worth is the product of the Broken Hill mines.

Copper.—The following table shows the pro-

duction of copper in Australia up to the end of 1904 with the output for 1904:

State.	Total.	1904.
New South Wales	£7,017,166	£406,001
Victoria	206,895	.....
Queensland	2,981,910	257,896
South Australia	24,116,098	432,063
West Australia	461,447	25,180
Tasmania	5,602,184	507,066
Total	£40,385,700	£1,628,206

It will be seen that South Australia has produced the greatest quantity of copper, but of late years Tasmania has had the largest output.

Tin is also found in payable quantities in many parts of Australia, the production to 1906 amounting to £21,549,000. Iron is distributed throughout the Commonwealth and at Lithgow, in New South Wales, where iron and coal deposits lie alongside each other, a commencement has been made to smelt the ore. Tasmania has enormous deposits situated near the Blyth river. Other minerals widely diffused throughout Australia are antimony, bismuth, manganese, platinum, tellurium, lead, wolfram and a number of earth colors. The annual production of such other minerals amounts to about £800,000.

Coal.—Coal was first discovered in New South Wales in 1797. Since that time it has been proved that nature has bountifully supplied Australia with mineral fuel. Black coal forms one of the principal mineral resources of New South Wales and it is estimated that the known areas of coal fields of this class contain over 85,000 million tons. The following table shows the value of the total output of coal in the respective States and also the output for 1904:

State.	Total output.	Output in 1904.
New South Wales	£46,016,054	£1,994,952
Victoria	1,331,877	70,208
Queensland	3,325,609	166,536
South Australia	.....	.....
West Australia	373,598	67,174
Tasmania	524,859	29,878
Total	£51,571,997	£2,328,748

Brown coal or lignite occurs principally in Victoria but it is much inferior to the black coal. Good coal has been found in Western Australia, while in Queensland the extent of the coal fields is practically unlimited — over 24,000 square miles of coal measures having already been explored. Tasmania also has important carboniferous formations.

Marble of high quality is found in many parts of Australia, while the finest opal known is obtained in the Upper Cretaceous formation near Wilcannia, New South Wales. The output of opals from this district amounts to about £125,000. Other gemstones, including emeralds, sapphires, rubies, etc., are found in various parts, while diamonds are found in New South Wales, Victoria, Queensland and South Australia, though only in the first named are the diamond drifts worked commercially.

Commerce.—The external trade of Australia is increasing rapidly as the following table shows:

Year.	Imports.	Exports.	Total trade.
1861	£17,562,960	£17,399,656	£34,962,616
1881	29,031,131	27,528,583	56,559,714
1901	42,433,811	49,696,172	92,129,983
1905	38,407,579	56,750,347	95,157,926

If the interstate trade be included the figures will be greatly increased. Taking, for instance, the returns for 1905 and including the interstate figures the trade of each state was as follows:

Imports.	1905.
New South Wales	£29,433,078
Victoria	22,317,195
Queensland	6,504,919
South Australia	8,431,594
Western Australia	6,481,309
Tasmania	2,652,777
Total	£75,820,872

The following figures show the distinction between oversea and Australian goods:

	Goods Imported.	Interstate Trade.
New South Wales	£14,573,819	£14,859,259
Victoria	12,937,932	9,379,263
Queensland	3,164,487	3,340,432
South Australia	3,224,589	5,207,005
West Australia	3,768,830	2,712,479
Tasmania	737,922	1,914,855
Totals	£38,407,579	£37,413,293

The total exports for the same year were as follows:

Exports.	1905
New South Wales	£36,645,451
Victoria	22,706,658
Queensland	11,862,367
South Australia	9,455,991
West Australia	9,789,354
Tasmania	3,703,819
Total	94,163,640

These are distinguished as follows:

	Oversea Direct.	Interstate Trade.
New South Wales	£24,484,740	£12,160,711
Victoria	14,028,641	8,678,017
Queensland	3,384,856	8,477,511
South Australia	5,402,638	4,053,353
West Australia	8,977,297	812,057
Tasmania	472,175	3,231,644
Totals	£56,750,347	£37,413,293

The external trade of the Commonwealth amounts to £23.10.0d per head of population, which is nearly four times that of the United States and considerably greater than that of the United Kingdom.

Of the total trade 49 per cent in 1905 was with Great Britain, 23 per cent with other parts of the British Empire and 30 per cent with foreign countries. The trade of Australia shows a considerable diversion in recent years from Britain to foreign countries. In fact one-third of imported goods are now of non-British origin as compared to one-fourth 10 years ago, and of the exports over one-fourth are sent to non-British countries compared with one-tenth in 1885. The chief cause of this is the establishment of direct and rapid communication between Germany, France, Belgium, Japan and the United States with Australia.

In the exports the same tendency is noticeable, in 20 years the percentage to Great Britain having fallen from 74.91 per cent to 46.11, while exports to foreign countries have increased from 9.26 per cent to 25.89 per cent.

The following are some of the chief articles of export during 1905:

Butter	£2,447,133
Copper, ingots, and matte	2,103,694
Coal	910,518
Wheat	4,140,676
Flour	1,211,351
Lead, pig, and matte	772,079
Leather	418,681
Beef	441,018
Mutton and lamb	1,081,151

Rabbits and hares	£338,823
Silver, bar, ingot, etc	818,341
Silver lead	757,460
Hides	176,030
Rabbits and hares (skins)	231,627
Sheep skins	1,396,849
Tallow	774,646
Timber	1,036,183
Tin, ingots	714,074
Wine, fermented	106,789
Wool, greasy, washed and scoured	19,822,216
Gold	10,965,612

Shipping.—In 1904–5 the total number of vessels, in the interstate, coastal and oversea trade, exclusive of river traders, entering and clearing Commonwealth ports was 17,691, of 29,150,962 tons. This shows an increase of 813 vessels and 4,450,847 tons on the figures of the previous year.

The number of vessels and tonnage of same entering Australian waters from foreign parts and those clearing for same is shown in the following table:

	1905.		
Description of Vessel.	Vessels.	Tons.	Crew.
Entered:			
Steam	1,038	2,639,708	75,845
Sailing	938	1,085,378	16,744
Total	1,976	3,725,086	92,589
Cleared:			
Steam	1,050	2,629,677	76,285
Sailing	1,062	1,089,654	17,067
Total	2,112	3,719,331	93,352

TIMOTHY AUGUSTINE COGHLAN,
Agent-General for New South Wales.

11. Australia — Government Undertakings. The manifold activities of the State — which is the striking feature of Australian polity — originated from the obvious inability of a sparse population to develop an enormous territory by individual effort. Australia is nearly as large as the United States, if we exclude the northern part of Alaska, and even now it only contains 4,000,000 people. Roads, railways and means of communication in this vast territory were necessarily the care of the State in a country where neither individuals nor townships possessed sufficient capital or labor to undertake these works. Consequently posts, telegraphs, and railways in every State of the Commonwealth are under government control. The posts and telegraphs are since 1900 under the Federal Government but the railways continue to belong to the several States. The impulse given to State energies by the necessity for means of locomotion and intercourse soon led to the provision by the same authority of facilities for shipping produce. The control of harbors and rivers thus passed naturally to the State Governments and the State of New South Wales in 1902 compulsorily purchased all the sea frontages of the business portion of Sydney Harbor in order to exercise a more effective control of the wharves and prevent the charges being raised to shippers by any combination of private owners. The States have in many instances delegated the management of State property to boards. But the wisdom of vigorous and ever-watchful State activity is the accepted creed of the Australian democracy, which dreads nothing more than the industrial anarchy of unregulated individualism.

Railways.— Railways have always been regarded in Australia as a means of opening up new country. Naturally, therefore, they run through sparsely settled areas. Nevertheless, and in spite of the fact that new lines are being continuously added, the 13,500 miles of railway in the Commonwealth give a net return of 3.38 per cent. In all the States — and in New South Wales the tramways also — they are under government control. In Western Australia there are also 277 miles of private lines; in New South Wales, 81¼ miles; in Tasmania, 160 miles; in South Australia, 20 miles, and in Queensland, 102 miles. Until 1897 Western Australia favored the construction of lines of private enterprise on the Land Grant system; but the results as compared with governmental control were found to be so unsatisfactory, that, following the example of New Zealand which had had the same experience, the State acquired the Great Southern Railway (243 miles) by compulsory purchase. In order to minimize the dangers and political interference the management and maintenance of the railways in all the States is under the control of commissioners who are appointed for terms of not less than seven years and are independent of Parliament. In New South Wales and Victoria proposals for new lines are submitted to committees composed of members of both Houses of Parliament whose duty after taking evidence is to advise Parliament as to the expediency of their construction.

The following table shows the amount expended on construction and equipment up to 30 June 1905:

State.	£
New South Wales	43,062,550
Victoria	41,279,045
Queensland	21,610,980
South Australia	13,587,406
West Australia	9,808,458
Tasmania	3,920,508
Commonwealth	133,268,947

The greater part of the public debt of Australia has been expended on railway construction.

In 1850 the first railway was commenced but it was not until 1855 that the line was opened. It ran for 14 miles from Sydney to Paramatta. At the end of 1871 just over 1,000 miles of railway lines had been built. After that the work of construction was carried on rapidly and the following table shows the total number of miles open for traffic in the various States at the end of June 1905:

State.	Miles.
New South Wales	3,280 3-4
Victoria	3,394
Queensland	3,692 1-2
South Australia	1,745 3-4
West Australia	1,605
Tasmania	462 1-2
Commonwealth	13,580 1-2

The following tables show the net profit after paying working expenses, and the percentage of profit to capital invested:

State.	Net profit.	Percentage in capital.
New South Wales	£ 1,491,869	£ 3/ 9/3
Victoria	1,462,643	3/10/9 1-2
Queensland	598,695	2/15/5
South Australia	536,530	3/19/
West Australia	354,126	3/12/2
Tasmania	71,926	1/16/7
Commonwealth	£ 4,515,789	£ 3/ 7/9

The freight charges are low, as the main object of railway construction has been to open up and develop the country Railway construction in Australia has not proceeded with uniformity of gauge. In New South Wales a gauge of 4 ft. 8½ in. has been adopted. In Victoria 5 ft. 3 in., in South Australia partly 5 ft. 3 in. and partly 3 ft. 6 in., while in the other States 3 ft. 6 in. in gauge is universal.

Speaking generally the agricultural districts are excellently served with railways. The total number of passengers carried annually amounts to about 115,000,000, the receipts from coaching traffic being about 41 per cent of the whole and those from goods traffic 59 per cent.

Other Public Works.— The early settlement of Australia, unlike that of America, was centralized in the capital cities of each State; consequently municipal institutions and local government are as yet imperfectly developed. Thus many of the functions of municipalities are performed by the Central Government although there is a growing tendency to transfer these to local bodies as the country population gathers round townships. At present the State Governments maintain all main roads and bridges. They also construct the harbor works and provide dredgers for their maintenance. In Melbourne and Sydney this work has been delegated to Boards. Punts and ferries on rivers are also under the control of the State Governments; which is also charged with the construction of all school buildings, prisons, and hospitals. Water conservation is another very important function of the State Governments, and large sums have been spent in sinking for water and maintaining artesian wells along the stock routes of the dry interior.

Activities of Federal Government.— The Federal Government of the Commonwealth has not yet assumed all the powers which by the Constitution are permitted to it. At present it only controls public works in so far as these are connected with the postal, telephonic, and telegraphic services, with military and naval defence, and with the customs houses. It will soon also take over from the States the lighting of the coasts, the quarantine grounds, and the observatories.

The Commonwealth Parliament has recently passed an act providing for the compulsory reference of industrial disputes extending beyond the limits of one State to a judicial tribunal; but it is questionable whether this act is not unconstitutional, and in its present form it is not likely to be effective. The Commonwealth has also, in the exercise of its powers to «make laws with respect to trade and commerce,» passed a stringent law against fraudulent marks on goods whether these are imported or made in Australia, and also to provide for the marking with a government stamp on all goods intended for export. The same measure permits goods which are made under trade union conditions to be marked with a special union label. The Parliament has now before it a measure to prevent trusts and combines within the Commonwealth and to prohibit the importation of «dumped» goods (i.e. goods sold for export at below cost).

In military matters the Parliament, under the influence of the Labor party, have adopted the principle that if a country is worth living in it is worth defending; and that therefore it is the duty of every citizen in a democracy to be able to bear arms. The Defence Acts empower the calling out of every citizen under the age of 40, and provision is made for universal instruction in military matters by the formation of cadet corps in all the State schools. A movement is now on foot for providing for the coastal defences of Australia by means of locally owned warships. The Federal Government administers as a dependency the British portion of New Guinea which is now known as Papua. It is also proposed that the Federal Government shall provide old age pensions.

The Federal Government has control of immigration but its activities in that direction are at present hampered by the jealousies of the States which own the available land and are willing to co-operate with the Commonwealth. The law as to the immigration of undesirables is practically the same as that of the United States, and Canada; but its administration is less strict. No white person has ever been excluded under its provisions.

State Activities.— All the States, except Tasmania and Western Australia, have from time to time attempted to deal with the problem of the unemployed by means of labor settlements. None of these, however, have been permanently successful and they have not been adopted on any large scale.

Co-operative and village settlements have, however, been more successful in Victoria and South Australia. Areas of land are set apart in both these States for village communities. The government makes advances for improvements and on the performance of the required conditions the occupier may obtain a perpetual lease on the freehold of his block. Up to 30 June 1904, a total of 1,891 settlers, making with their families a community of 8,556 souls, were residing in these settlements in Victoria on an area of 57,588 acres on which improvements had been effected to the value of £254,955. In South Australia at the same date, the number of settlers was 84, to whom £102,116 had been advanced, while the improvements effected were valued at £41,869. The unoccupied lands in every State belong to the State and not to the Commonwealth.

Agricultural Activities.— Every State has tried by legislation to improve and develop its agricultural resources. Until the establishment of the Commonwealth the States gave bonuses on the export of butter, cheese, and fruit, but these have now ceased. There are, however, in New South Wales, Victoria, and South Australia depots under State management for the storage and freezing of perishable products. Exports of poultry, butter and cheese are graded and marked by government brands, and South Australia for some years maintained in London a depot for the sale of her wines. Most of the States have appointed boards which are empowered to lend money to farmers to effect improvements. Every State maintains agricultural colleges or lecturers, and in some there are experimental farms. New South Wales maintains State nurseries for fruit and forest trees.

Charities.—The administration of charity is an important function of the States in a country

which has no poor law; hospitals, asylums for the insane, asylums for the aged, orphanages, and industrial schools are all established and maintained by the State governments. A system of boarding out of State children is also in operation in New South Wales, Victoria, and South Australia. Old age pensions of 10/ a week are given in New South Wales to all above the age of 65 who have not an income of £26 a year.

Industrial Activities.—In New South Wales and Victoria the States have adopted the view that an industrial dispute between capital and labor is as much a concern of the State as a quarrel in the street between two citizens. Each State deals with the matter in a different way. In New South Wales a tribunal has been established to which all industrial disputes must be referred. A workman striking or a master locking out before making such a reference is guilty of a misdemeanor. The court has power to enforce its awards by fine or imprisonment: it can direct a minimum wage and may order that preference be given to unionists in any industry. It has power to declare an order made in any case to be the «common rule» of the industry in question within a given area. It is claimed for this act, which has been in force since 1902, that it has given a new security to capital by preventing strikes and that it has abolished «sweating.» In Victoria, Wages Boards have been established for every industry, consisting of an equal number of representatives of workmen and employers with an umpire. All questions relating to the trade may be referred. The decisions of the board may be enforced by action in the courts as upon the award of an arbitrator.

The Factory Acts of Great Britain have been partially adopted by all the States, but in none is there the same strictness of supervision nor the same restraint upon the manufacturer as in England. The government of New South Wales makes the clothes of the railway employees and police in a State factory. Most of the States have State workshops for manufacturing rolling stock and railway engines. The State of New South Wales also owns a dry dock and a ship repairing plant.

All the States publish Year Books giving full details of the progress of the State, and the working of all government departments. These can be obtained gratis on application to the Agent-General of the State in London.

Bernhard Ringrose Wise,
Formerly Attorney-General, New South Wales.

12. **Australia — Finance.** In matters of finance, as well as in many other things, Australia presents a most interesting field for study. Sprung from a splendid body of pioneers, who had been brave and enterprising enough to quit the old home-land, with all its tender associations, and well ascertained conditions of life, and to cross the ocean, in a voyage lasting, in those days, three or four months, in order to the beginning of a new life under unaccustomed conditions, in a new and undeveloped land, the colonists have wrought wonders. Untrammeled by any undue preference for the old ways and with ample scope for bold, not to say audacious, experimenting, the spirit of enterprise, inherited from their fathers strong in them, the second generation of the settlers, who are the Australians of to-day, have striven to put into practice, and by no means without success, some theories which have elsewhere remained merely theories. In their systems of land settlement, their State ownership of such undertakings are railways, tramways, water-works, etc., and in schemes of taxation, to say nothing of other matters of finance, they have sometimes discarded precedent and have no reason to be ashamed of the results which they have to show for their enterprise and fearlessness. Complicated as are, in some respects, Australian questions, through the existence, at one and the same time, of a dual citizenship, every person owing allegiance to his own individual State and also to the broader Commonwealth government, a very little care will enable a complete view to be taken of Australian finance, including both those figures relating to the Commonwealth, or National, and to the State, or Provincial Governments. The 4,000,000 people of the Commonwealth occupying the great island continent of Australia and the adjacent small one of Tasmania, with an area, in all, of as nearly as possible 3,000,000 square miles, having, for national purposes, united under the Commonwealth Constitution Act, are still, in respect of all but certain specified matters, citizens of one or other of the six States of New South Wales, Victoria, Queensland, South Australia, Western Australia, and Tasmania. So far as their finances are concerned it is necessary to remember that to the Commonwealth are assigned very large powers of taxation, which, however, are, so far, only exercised in respect of customs and excise, the whole revenue from which is collected by the Commonwealth, the balance, after meeting its own necessities, being handed over to the States, in proportion to the amount of the duties derived in each State. The Commonwealth controls all posts, telegraphs, and telephones, as well as all military and naval defences, and also several other important departments of State, but the finances and statistics are unaffected by these matters, as in the case of all of them, where there is Commonwealth control State control ceases. In taxation, however, if it were attempted to show the total for Australia by adding to the total for the Commonwealth those for the States, the result would be wrong; just as would be any attempt to get the total revenue or expenditure for Australia by adding Commonwealth totals to those for all the States, because of the portion of the customs and excise revenue which, being first collected by the Commonwealth, is afterward paid over to the States and so would appear twice in the totals. In this statement care will be taken to show all the figures once, without any duplication whatever. The figures given will, unless otherwise stated, be from the unchallengeable authority of the latest volume published by the government statistician of New South Wales, Mr. Coghlan, now Agent-General for that State in London. We shall, however, begin with the totals of revenue and expenditure of the Commonwealth for the financial year ending 30 June 1905, as given to Parliament by the treasurer of the Commonwealth, the Rt. Hon. Sir John Forrest, in his budget speech in August 1905.

The figures show the sum collected in each State:

State	Customs and Excise	Posts and Telegraph	Other Revenue	Totals
N. S. Wales.	£3,033,617	£980,141	£6,968	£4,020,727
Victoria	2,488,842	682,565	7,800	3,179,207
Queensland.	1,095,476	331,096	3,288	1,429,860
S. Australia.	678,880	266,691	7,838	953,409
W. Australia	1,029,515	257,489	1,938	1,288,942
Tasmania...	330,651	112,923	2,047	445,621
Totals	£8,656,981	£2,630,905	£29,880	£11,317,766

Beside the totals given the Commonwealth collected in Western Australia, and paid over to that State, temporary duties amounting to £142,549. The expenditure was:

Customs and excise department.....	£256,060
Military and naval defences.....	706,279
Posts, telegraphs and telephones.....	2,560,756
Other expenditures	461,497
Total	£3,984'592

The customs and excise revenue for the year ending 30 June 1905, was collected under the following heads:

CUSTOMS.

Stimulants	£2,050,648
Narcotics	922,248
Sugar	192,391
Agricultural products and groceries.....	684,746
Apparel and textiles.....	1,348,848
Metals and machinery.....	454,325
Oils, paint and varnish.....	121,466
Earthenware, etc.	138,122
Drugs and chemicals.....	56,646
Wood, wicker and cane.....	202,719
Jewelry and fancy goods.....	166,906
Leather and rubber.....	154,588
Paper and stationery.....	106,488
Vehicles	80,813
Musical instruments.....	47,062
Miscellaneous	122,025
Total customs	£6,850,041

EXCISE.

Stimulants	£753,529
Tobacco	516,761
Sugar	503,627
Miscellaneous	33,023
Total excise	£1,806,940
Total customs and excise.....	£8,656,981

The amount per head in each State was as follows: New South Wales, 41/7 1-2; Victoria, 41/1 1-2; Queensland, 42/.; South Australia, 36/5 1-4; West Australia, 85/.; Tasmania, 36/8 1-4. Total, £2 3 5 1-2. The free list in the tariff covers 10,000,000 sterling value of imports out of a total of £36,244,000 per annum.

The Commonwealth, it will be noticed, has no revenue from any other form of taxation beside customs and excise, neither has it any territorial revenue, having no control over the huge areas of unalienated lands, which still remain in the hands of the several States. It is to a large extent a tax-gatherer for the States, the constitution requiring it, for the first 10 years at least, to return to the States, or to pay on their behalf as interest or principal on State loans, not less than three-fourths of the total income from customs and excise. This provision was adopted in order to avoid dislocation of the State finances through the transfer of this revenue from the States to the Commonwealth, and also to restrain the Commonwealth Parliament from mopping up all the revenue from customs and excise by launching out on new and costly enterprises, which might leave the States in an awkward financial position. The Commonwealth Parliament as it is has set its face sternly against borrowing, even for public works, pays for all that are necessary out of surplus revenue. It is proposed in influential circles to federalize the State loans to such an extent as would finally absorb the revenue now returned year by year to the States, so as to remove the present interdependence of Commonwealth and State finance. The expenditure of the Commonwealth is narrowed down to a very few items. We have the cost of the departments transferred from the States to the Commonwealth and now controlled by it, such as the customs and excise, posts, telegraphs, and telephones, military and naval defenses, etc. To these are added the cost of the Commonwealth machinery of government, including the departments of the Governor-General, the Ministers of State, and the Legislature, together with the Judiciary. The outlay on public works and buildings was for the year under review £333,725, and the total expenditure was therefore £4,318,435. The balance of revenue over expenditure was returned to the States as follows: New South Wales, £2,529,069; Victoria, £2,071,378; Queensland, £752,532; South Australia, £555,692; Western Australia, £885,349, and Tasmania, £259,099. Total, £6,999,119; beside £142,549 collected for Western Australia and paid to that State. This was in excess of the minimum laid down by the constitution. The payments to the States must tend to diminish as the Commonwealth extends its functions, but, in many cases, the new departments will be taken over from the States, which will in that way obtain relief. The expenditure quoted includes the imperial naval subsidy and £20,000 for British New Guinea.

The revenue and expenditure of the several States forming the Commonwealth will be seen by the following tables compiled from the budget speeches delivered by the State treasurers shortly after the close of the financial year ending 30 June 1905:

State.	Returned by Commonwealth	Taxation	Land Sales and Rents	Public Works	Miscellaneous	Totals
New South Wales.....	£2,529,069	£1,114,408	£1,757,902	£5,055,353	£880,186	£11,336,918
Victoria.....	2,017,378	713,227	388,170	3,609,120	781,762	7,509,657
Queensland.....	752,532	454,574	623,416	1,409,414	355,462	3,595,398
South Australia.....	555,692	439,048	182,247	1,382,749	165,988	2,725,724
West Australia.....	1,027,898	221,735	315,613	1,797,433	252,661	3,615,340
Tasmania.....	259,999	216,953	82,811	220,632	3,199	852,694
Totals.....	£7,141,668	£3,159,945	£3,350,159	£13,544,701	£2,439,258	£29,635,731

The expenditure was as follows:

New South Wales.....	£11,195,075
Victoria	6,982,673
Queensland	3,581,403
South Australia	2,693,495

Western Australia	£3,745,224
Tasmania	842,469

The grand total was therefore £29,040,339, leaving a surplus of £595,392.

It will be seen that nearly one half of the total revenue of the States is derived from "public works." This represents the earnings of the railways, tramways, harbor works, and water-works, together with other lesser undertakings, the construction of which has been the main factor in building up what at first sight appears to be the huge debt of Australia. It may, however, be noted that the public works not only aid very greatly in the development of the vast areas of the unoccupied Crown lands in Australia, but they also produce a large annual revenue, which may well be set off against the annual interest charge, as the value of these permanent assets are set off against the debts themselves. The works include between 13 and 14 thousand miles of railways, which cost just over £132,930,764, up to the end of 1904, the latest year for which the details are obtainable, and for that year they earned, over and above working expenses and upkeep, the sum of £4,065,631 toward interest on the loans raised to pay for them. As the country through which they pass develops their earnings must increase. The item land sales and rents is much lower than in past years as the present policy of all the States is to encourage settlement, by leasing land on very long leases, with or without right of purchase, so as to assist people with little capital, rather than to sell land for cash. In many cases the purchase money is spread over as much as 20 years, all payments going off the purchase money, so as to aid would-be cultivators, who art short of funds, to make a start. The provision of such conveniences as roads, bridges and schoolhouses, absorb practically all the proceeds from the land for several years after it is first leased, so that the States are by no means living on their capital. The lands which once returned no revenue at all are, by these means, being gradually developed and made to produce loading for the railways and business for the harbors as well as assets and income taxable by the treasurers. The taxation differs in the several States, though most of them now levy on the estates of deceased persons in proportion to the size of the bequests left and to the degree of relationship between the testator and the legatee, the larger bequest and the more distant relative paying the higher rate. There are also, in most States, taxes on income and on "unimproved land values," that is to say on the capital value of land less the value of improvements thereon. The direct taxation including all these came for the whole Commonwealth, in the latest year for which figures are available, to 14 shillings and 4 pence per head. The extremes in different States were South Australia highest at 18 shillings and 1 penny per head, and Victoria lowest at 12 shillings and 4 pence. The principle of progression in taxation is recognized in some States, not only in succession duties, but in income and also in land values taxation. The usual distinction is observed between income derived from personal exertion, and therefore dependent upon the life and health of the earner, and that derived from investments or property, which is independent of personal effort. The rate of tax is higher on the income from property than upon the produce of personal exertion. There is, too, the further graduation according to the amount of the income. In Victoria, for example, the rate is on incomes derived from personal exertion 3d. in the £ up to £300, on every £ in excess of £300 up to £800 4d., over £800 to £1,300 5d., over £1,300 to £1,800 6d., and over £1,800 7d. in the £. Double these rates is charged on income from property. The land values taxation levied in certain States is on the value of the land after deducting the value of improvements thereon. It is, therefore, much heavier on city and suburban than on country land, area for area. Taking South Australia the rate is one halfpenny in the £ capital value up to £5,000 value, and one penny in the £ if the value be over £5,000, and there is also an extra tax of 20 per cent. on the first tax if the owner of the land be not resident in the State. The miscellaneous receipts call for no special remark. The total revenue looks very large, but it needs to be remembered that altogether apart from the postal and telegraphic receipts, which appear not in the State, but in the Commonwealth accounts, as do also all figures relating to military and naval defences, nearly one half of the total is for services rendered to the people by means of public works, and altogether outside the ordinary functions of government, as commonly understood. On this account it cannot be said that Australians are burdened by the contributions they make to revenue, even though they pay in all, to Commonwealth and States, £7, 8 per head per annum. The further taxation levied by local governing bodies for purely local expenditure, such as road maintenance and sanitation, is not large. The figures for Western Australia are abnormal on account of the rapid development of the gold-fields and the resulting preponderance of highly paid adult males in the population, consuming highly dutiable goods. The expenditure of the States would be absurdly high were it not for the fact that it includes, to the extent of 50 six per cent of the whole, provision for the working of the railways and the payment of interest and repayments of debt. These charges are not in any true sense "costs of government." They must be considered in relation to special income appearing on the other side of the account. That seven per cent of the expenditure is for education is indicative of the general trend of affairs in Australia, and of the high ideals cherished. Of course it needs to be remembered that at the present stage settlement is sparsely spread over a huge territory, and that the costs of administration would be slightly increased, if at all, if there were three or four times the number of people on the land that there are to-day, while the revenue would be largely multiplied. It is area rather than population which, under certain circumstances, determines expenditure, and these circumstances exist in many parts of Australia to-day. The Australian of the present is fully determined not to allow extravagance in public expenditure, and no blunder in public life is more speedily punished by the electors. The expenditure of the States of course includes all the cost of the legislative machinery, with the salary of the State governors, and the members of the State parliaments, and also all the charges connected with the administration of all the departments, such as police, public health, and educa-

tion, together with the oversight of an elaborate system of local government in each State, which in its turn deals with a wide area of purely local concerns. Australia indeed possesses all the concomitants of a highly organized political and social organism, and believes that it gets a full return for its public expenditure. The exceedingly close approximation of expenditure to revenue results from a disposition, whenever any considerable surplus appears in the accounts for any year, to devise further public conveniences which may be provided for the future, and so the surplus is absorbed. There is no general desire to show large surpluses nor is there much effort to reduce taxation, which is not felt to be burdensome, but rather to add to the facilities afforded for trade, and for the occupation and development of the country and of its industries. These ends are being achieved, and the cost of them is not grudged by those who have to find the money, and who reap the gain.

The debts of Australia have all been incurred by the States, and the Commonwealth has, as yet, carefully avoided any line of policy which would involve it in any necessity for embarking on a borrowing policy, on its own account. Indeed, as has already been suggested, the Commonwealth Parliament has determined to construct all such public works as post offices, fortifications, etc., out of revenue. It has taken over from the States all the customs houses, post offices, military and naval defences, stores, etc., which were the property of the States, prior to the establishment of the Commonwealth, and will ultimately have to recoup the States for them, either by taking over State debts to an amount equivalent to their value, or in some other way, which must almost of necessity involve the Commonwealth in a debt, and it is probable that the final settlement between the Commonwealth and the States, as to the annual surplus now paid over to the States out of the proceeds of the customs and excise duties, may result in the assumption by the Commonwealth of the responsibility for a certain portion of their public debt. There are further schemes in contemplation for the transfer of State obligations on certain terms to the Commonwealth, beside which there are proposals under consideration, in Commonwealth circles, for the construction of trunk lines of railway across the continent of Australia, east and west, as well as north and south, and also for naval defence which, when carried out, will require the raising of Commonwealth loans. For the present, however, we have only the debts of the States to treat of. Mr. Coghlan's 'Statistical Account of Australia and New Zealand,' published early in 1905, gives the debts of all the States of the Commonwealth as follows:

State	Debt	Per head	Annual interest
New South Wales...	£80,033,581	£55 7 2	£2,841,368
Victoria.....	51,819,962	42 19 4	1,885,983
Queensland	41,781,287	79 11 5	1,547,470
South Australia.....	28,593,645	77 9 1	1,069,325
Western Australia..	16,090,288	67 12 1	547,160
Tasmania	9,318,400	51 18 4	341,627
Total debt	£227,637,163	£57 8 8	£8,232,933

These figures practically represent the position as it is to-day. All the States have some provision of the nature of a sinking fund for the ultimate extinction of the debts and in several cases stock is from time to time purchased and canceled out of funds set apart for purposes of redemption. None of these funds have, however, as yet, assumed proportions sufficiently large to modify materially the facts as to the total debts just quoted. The debt of Australia in no case represents the cost of war. The whole of it has been incurred with a view to the development of the vast resources of the continent and for practically the whole of it there are very valuable permanent assets. Of the total debt of £227,637,163, £136,600,855 was spent on railways and tramways; £29,245,167 on water supplies and sewerage; £17,373,507 on harbors, rivers, and navigation; and £17,188,178 for public works and buildings, beside other sums for telegraphs, telephones, defence, and other items. The net revenue produced by these works aggregated, in the year under review, over and above working expenses and maintenance, 2.30 per cent. on their cost. It should be also remarked that the year for which the figures are given was not a normal year, the effects of the previous year's drought having by no means passed away. The revenue from this source could be increased to an amount sufficient to meet in full the interest charge, if it were desired to do so, but the charges for railage and harbor dues and water supplies, etc., are all kept down with a view to the encouragement of settlement and of production, it being recognized that the direct return received from the enterprises is by no means the sum of their earnings, as they produce through the resulting prosperity of the people, a very large indirect return through the customs house, and in many other ways. It is the general prosperity rather than the direct revenue which is the primary objective for the time being. Meantime the works are permanent assets of constantly increasing value, and revenue earning power. As has often been pointed out, Australia could, by the sale of her railways, harbor works and water services, immensely reduce her public indebtedness, for the undertakings would sell readily for what they cost, but she would be poorer, rather than richer, by the transaction at once, to say nothing of the folly of such a policy from the point of view of the future. There is, further, one great asset of Australia which cannot be overlooked in any consideration of her financial position, and that is her unalienated land. In four out of the six States the areas are very large and, although the values vary very widely according to climate and other conditions, they call for tabulation, and the following statement shows the area of each State, and the unalienated land in each, etc.:

It is necessary to bear in mind that the public indebtedness of the Australian States was not contracted against any specific security, but against the public credit of each generally, so that there is behind it, not only the public estate in the shape of land and works of every kind, but also the whole taxing power of the respective governments. In view of this it must

be manifest that the securities are absolutely «gilt edged.» The following table shows the figures given by Mr. Coghlan as to the values of the alienated land and the improvements thereon, and also the value of the private property in Australia:

State	Area in Acres	Area alienated or in process of alienation	Area leased	Area neither alienated nor leased
New South Wales	198,848,000	48,851,524	127,901,840	22,094,636
Victoria	56,245,760	24,526,255	9,516,372	22,203,133
Queensland	427,838,080	16,991,127	277,569,396	133,277,557
South Australia	578,361,600	14,149,171	189,531,955	374,680,474
Western Australia	624,588,800	10,548,057	135,678,028	478,362,715
Tasmania	16,778,000	5,040,413	1,581,937	19,155,650
Total Commonwealth	1,902,660,240	120,106,547	741,779,528	1,040,774,165

The volume of business done in the Commonwealth by the various life assurance offices is very large as the figures quoted below will show, and there are also a number of friendly benefit societies, whose roll of membership is indicative of the widespread practice of habits of thrift and self-help. Industrial life assurance is also widely availed of by persons who are not able to afford large premiums for life assurance of other types. The receipts and expenditure of the 17 life assurance institutions for the year were: Receipts, £5,186,062; expenditure, £3,483,532. The average amount of life assurance per head of the population was £25. There are 300,453 members of friendly societies, and their funds amount to £3,190,322. It will thus appear that as regards the public wealth, the private wealth, and the annual product of labor and capital in Australia there are abundant evidences of soundness and of progress, and that Australia may fearlessly challenge comparison with any other part of the world. At the same time the magnitude of her undeveloped resources points unerringly to a future which shall outshine both the past and the present.

State	Land without improvements	Land and improvements	Total value of property	Per head
New South Wales	£136,417,000	£264,492,000	£368,778,000	£258
Victoria	126,078,000	234,057,000	310,074,000	256
Queensland	41,400,000	72,040,000	119,454,000	229
South Australia	35,957,000	59,176,000	86,320,000	234
Western Australia	21,832,000	19,272,000	49,065,000	216
Tasmania	21,832,000	34,907,000	48,288,000	269
Total Commonwealth	£373,679,000	£683,944,000	£981,979,000	£249

Of course, the figures in the last two columns are subject to adjustment on account of absentee ownership, persons in one State often owning properties in other States. Mr. Coghlan also furnishes elaborate calculations to show the amount of the private incomes of the people, excepting interest paid by Australian governments, that is to say money paid by themselves to themselves, and his result is a total of private annual incomes of £179,563,000 or £45 per inhabitant of Australia, including men, women, and children.

The extent of the financial operations conducted within the Commonwealth will appear from the sworn returns of the banks doing business there for the year 1904. The totals were: Notes in circulation not bearing interest, £3,133,268; bills in circulation not bearing interest, £521,267; deposits not bearing interest, £34,968,383; deposits bearing interest, £56,579,719; balances due to other banks, £290,439; total liabilities, £95,493,076. The assets are shown as follows: Coin, £17,910,771; bullion, £1,447,698; landed property, £5,245,311; debts due to banks from other banks, including notes and bills discounted, £87,052,471; balances due from other banks, including notes and bills of other banks, £2,126,809; total assets, £113,783,060. Beside the joint stock banks, whose returns have just been quoted, there are numerous investment companies carrying on business in the Commonwealth such as savings banks, land, building, and investment, trading and commercial companies, complete returns of whose business are not available. For the savings banks, which are under government supervision, the following figures will be suggestive: Number of depositors, 1,072,853, or 27 per cent of the whole population. Amount on deposit at the close of the year, £34,180,055 or £8 13s. 8d. per head of the whole population, and £31 17s. 2d. per depositor.

Sir F. W. Holder,
Speaker House of Representatives, Commonwealth Parliament, 1901–1907.

13. Australia — The Labor Party. The Australian Labor Party has its genesis in the great maritime strike of 1890. It is true that spasmodic attempts had been made during earlier years to procure direct Parliamentary representation for working-class interests, and in two or three isolated instances men had been returned to one or other of the Colonial Parliaments. Nothing, however, in the nature of an extended or sustained effort had been attempted prior to the great strike. For some years before 1890 the trades unions generally had been gaining in strength and influence, and had won many concessions from the employers in regard to wages and working conditions; but the seafaring classes had not participated in these advantages in anything like equal degree. A

crisis was reached when the marine officers, who had been for years overworked and underpaid, decided to form a union and affiliate with the other labor orgnizations. The shipowners demanded, as a preliminary to the discussion of grievances, that the officers should dissociate themselves from the labor unions; but, fearing this would leave them at the mercy of the employers, the officers refused to acquiesce, and a strike was precipitated. In sympathy with the officers, the seamen and longshoremen around the coast ceased work, and as the employers continued obdurate the trouble extended until the strike included many unions wholly unconnected with shipping. «Freedom of Contract»—an equivalent of the American «open shop»—became the war-cry of the employers, and practically the whole community took sides with one party or the other. After a struggle lasting some three months, during which trade was paralyzed, much bad blood created, and both sides financially injured, the men acknowledged defeat. Apart from the cost to the combatants themselves, the public had suffered severely, and when the smoke of battle had cleared away there was a general desire expressed to find some way of avoiding similar conflicts in the future. A Royal Commission was appointed by the government of New South Wales, and served some good purpose in ascertaining clearly the grievances of the men; but it achieved little of a practical nature beyond suggesting the creation of an Arbitration Court to which disputes could be voluntarily referred. The press, while mostly taking the employers' view upon the points at issue, concurred in advising the unions to rely upon legislation to remedy their legitimate grievances, and this advice was taken seriously by the men when they emerged from the conflict—defeated, but grimly determined to retrieve their lost influence.

While the effects of the strike had been felt all through Australia, the battle had raged most fiercely along the eastern seaboard, where population is greatest, and therefore the colonies mostly affected were those of New South Wales, Victoria, Queensland, and South Australia. It was in these colonies, then, where the cry arose for a more equitable distribution of political power and a greater consideration of labor interests. This demand was accentuated by the political conditions existing at the time. From the granting of self-government the Parliaments of the various colonies had included many men who fought strenuously for the people's interests, and who deserve the wholehearted gratitude of the reformers of to-day; but in spite of their efforts matters political were so backward in 1890 that there was an urgent need of a fresh impulse. While manhood suffrage had been nominally secured, plural voting obtained in all the colonies except South Australia; factory legislation was either nonexistent or so inefficient as to be practically useless; except in Victoria, nothing had been done to protect those working in dangerous occupations, such as mining; the question of employers' liability was in a very unsatisfactory state; hours of employment were unregulated, and sweating was rampant; and many other social questions were carefully avoided. In addition, and perhaps most important, there was no method by which public opinion could find expression in an authoritative manner with regard to the merits of labor disputes. Briefly, the complaint of the unionists and their sympathizers was that working-class interests had been neglected, as should perhaps have been expected from Parliaments made up for the most part of the wealthier classes or their representatives.

With a view to altering this state of affairs for the better, the unions decided upon political organization; but, recognizing that no purely class effort could be permanently successful, they called upon radicals generally to assist them in the work of reform. On this wider basis leagues connected with, but independent of the unions were formed, and programmes embracing the legislation immediately desired were speedily adopted. Necessarily these differed with the circumstances existing in the various colonies, but in the main they were markedly similar. In all, the central idea was to form a new party, working independently of those already existing, and prepared, until strong enough to take office, to accept installments from either of the older parties. Taking the platform adopted in New South Wales as typical, the aims of the new party were stated as being: «(1) To secure for the wealth-producers of this colony such legislation as will advance their interests, by the return to Parliament of candidates pledged to uphold the platform of this league: (2) to secure the due enrollment of all members of the league who may be entitled to a vote in any electorate: (3) to bring all electors who are in favor of democratic and progressive legislation under one common banner, and to organize thoroughly such voters with a view to concerted and effective action at all Parliamentary elections in the future.»

The platform adopted ran as follows:

1. Electoral reform — to provide for the abolition of plural voting; the abolition of money deposits in Parliamentary elections; the extension of the franchise to seamen, shearers, and general laborers by the registration of votes; the extension of the franchise to policemen and soldiers; the abolition of the six months' residence clause as a qualification for the exercise of the franchise; the establishment of single member electorates and equal electoral districts on an adult population basis; the holding of all Parliamentary elections on one day — that a public holiday; and that all public houses shall be closed during the hours of polling.
2. Free, compulsory, and technical education — higher as well as elementary — to be extended to all.
3. Eight hours to be the legal maximum working day in all occupations.
4. A Workshops and Factories Act to provide for the prohibition of the sweating system; the supervision of land, boilers, and machinery; and the appointment of representative working men as inspectors.
5. An amendment of the Mining Act — to provide for all applications for mineral leases being summarily dealt with by the local wardens; the strict enforcement of labor conditions on such leases; the abolition of the leasing system on all new gold fields; the right to mine on private property; the greater protection of persons engaged in the mining industry; and that all inspectors shall hold certificates of competency.
6. The extension to seamen of the benefits of the Employers' Liability Act.
7. The repeal of the Masters and Servants Act and the Agreements Validating Act.
8. The amendment of the Master and Apprentices Act and the Trades Union Act.
9. The establishment of a Department of Labor; a National Bank; and a national system of water conservation and irrigation.
10. Election of magistrates.

11. Local government and decentralization; the extension of principle of the Government acting as an employer, through the medium of local self-governing bodies; and the abolition of our present unjust method of raising municipal revenue by the taxation of improvements effected by labor.
12. The federation of the Australian colonies on a national as opposed to an imperial basis; the abolition of the present Defence Force, and the establishment of our military system upon a purely voluntary basis.
13. The recognition in our legislative enactments of the natural and inalienable rights of the whole community to the land — upon which all must live and from which by labor all wealth is produced — by the taxation of that value which accrues to land from the presence and needs of the community, irrespective of improvements effected by human exertion; and the absolute and indefeasible right of property on the part of all Crown tenants in improvements effected on their holdings.
14. The execution of all Government contracts in the colony.
15. The stamping of all Chinese-made furniture.
16. Any measure which will secure to the wage-earner a fair and equitable return for his or her labor.

On these lines the Labor Party entered the political arena in the four eastern colonies. The first skirmish occurred in South Australia, when the new party succeeded in returning three workingmen to the Legislative Council (the Second Chamber) in spite of a restricted franchise. This happened early in 1891, and in the middle of that year the first real trial of strength for control of the popular chamber took place. This was in New South Wales, where, notwithstanding the existence of plural voting, the Laborites captured some 36 seats out of 141. In 1892, Victoria followed the example of the older colony by returning a small contingent of labor members, and in 1893, both Queensland and South Australia elected parties of greater proportionate strength on the labor ticket.

With the first labor successes the wildest views were expressed by critics on both side— the Conservatives prophesying utter ruin for the community, and many Labor supporters expecting that the millenium would arrive in short order. Needless to say, both proved wrong. In the first place it was soon found that a proportion of those returned as Laborites were so only in name, and had no conception of the sentiment responsible for the movement. These quickly dropped out or were pushed aside. Then, as might have been expected in a party hurriedly organized, there arose internal dissensions of such a character as to seriously threaten, in one or two of the colonies, the future of the movement. As matters settled down, however, the need for cohesion was emphasized, and with the recognition of that fact better work resulted. Looked at broadly, the first Labor contingents did excellent work, which served to encourage the party's supporters to renewed efforts, and as a result the parties in the various colonies have been increasingly strengthened at each successive election. This steady growth has not been confined to those colonies where political organization was first entered upon, but has extended also to West Australia and Tasmania. At the present time (1906) Labor Premiers are at the head of coalition governments in Queensland and South Australia, while in New South Wales, Victoria, and West Australia, the Labor parties constitute the direct opposition, with the reversion of office. At the recent Tasmanian elections the party secured a material increase of strength.

The Labor party has not, during its 15 years of existence, succeeded in gaining a majority in any of the Australian Parliaments; but its influence is not to be gauged solely by its numerical strength. In most of the colonies its appearance galvanized the older parties into some appreciation of the need for social legislation. Old-time politicians suddenly manifested a tender regard for the interests of the working-classes, and vied with each other in propounding schemes for the amelioration of their condition. The democratization of those outside its ranks is among the most noticeable gains of the Labor party, and has resulted in many useful reforms being brought about.

In New South Wales there has thus been secured during the party's existence a liberal Electoral Act, abolishing plural voting; an act to allow mining on private property; land and income taxes, adjusting taxation more equitably; a Coal Mines Regulation Act; a Workshops and Factories Act; an Amending Land Act to permit of perpetual leasing in lieu of outright sale; an act to restrict the admission of colored immigrants; an important Navigation Act; an Early Closing Act, applying to shops; an Old-Age Pensions Act; an act to nationalize the private wharves of Sydney; the Miners' Accident Relief Act, designed for the relief and maintenance of injured miners and their dependents; the much-discussed Industrial Arbitration Act, prohibiting strikes and insisting upon the reference of disputes to the decision of a judicial body, and the Women's Franchise Act.

In South Australia education has been made free; the State has established a successful Produce Export Department; the nucleus of a State Bank has been formed, providing cheap loans to settlers; workmen have been assisted to take up land; adult suffrage has been passed; factory legislation and early closing of shops secured; wages have been protected against liens; private estates have been resumed and cut up for settlement, and other practical measures made law.

In Victoria the party's influence has secured, among other things, improved factory legislation, providing for boards to fix minimum wages; compulsory early closing of shops; abolition of plural voting; resumption of land for closer settlement, and cheap money for farmers on the *credit foncier* system; minimum wage on government contracts; State supervision of dairies; prohibition of secret trade commissions; pure food laws; exemption of tools of trade and furniture to the value of £20 from distraint for rent.

In Queensland legislation has been passed providing for the early closing of shops; adult suffrage and equal voting power; workers' compensation; State supervision of exports; cheap advances to settlers, and the readjustment of taxation in favor of the poorer classes.

In West Australia, although the party is only a few years in existence, the record includes adult suffrage, with electorates approaching equality; factory laws and early closing of shops; compulsory arbitration in industrial disputes; prohibition of secret commissions in trade, and minimum wages on government contracts.

With the inauguration of Federation in 1901 a new phase was entered upon, as a number of the most important governmental functions were

transferred from State to Federal control; and the Labor political organizations throughout Australia agreed to a common platform upon which to contest the first Commonwealth elections. It ran as follows:

1. Electoral Law, providing for one adult one vote.
2. Total exclusion of colored and other undesirable races.
3. Old-Age Pensions.
4. The Constitution to be amended to provide for: (a) The Initiative and Referendum for the alteration of the Constitution; (b) the substitution of the National Referendum for the double dissolution in the settlement of deadlocks between the two Houses.

At the first Federal elections, held in 1901, the Labor party returned 8 members out of 36 in the Senate and 16 out of 75 in the House of Representatives. Three years later, at the elections of 1903, the numbers were increased to 14 in the Senate and 22 in the House of Representatives. Since then the number in the latter House has been increased to 25. Though in a minority in both Federal Houses, the party has exercised a considerable influence on Commonwealth legislation. In the first Parliament it found a fairly progressive government in office, with a programme including several planks of the Labor platform, and some of these found expression in legislation. Naturally much time was occupied in passing necessary machinery measures, and the tariff discussion alone took up nearly 18 months. But time was found to pass adult suffrage and a liberal electoral law. The restriction, amounting practically to exclusion, of colored immigration was secured, and provision made for the cessation of the traffic in Kanaka labor. In the Public Service Act a clause was inserted providing for a minimum wage of £110 yearly for adults of three years' service. When the Tariff was being considered, the Labor party, though assuming no party attitude on Protection or Free Trade, led the way in abolishing or reducing revenue taxes through the Customs, and later it headed a successful resistance to the proposal to enter upon a borrowing policy.

At the second general election the Labor party increased its strength at the expense of both the Protectionists and Free Traders, with the result that when the Parliament met it contained three parties nearly equal in numbers. The Protectionist Government resigned through suffering defeat on an important phase of the Industrial Arbitration Bill, and a Labor Government took office. After a few months it was also defeated on one of the principles of the same measure, and was succeeded by a Coalition Ministry representing Free Traders and Protectionists. This government passed the Arbitration Bill through its remaining stages, but on again meeting Parliament was in turn defeated by a combination of Protectionists with the Labor party. Since then measures have been passed to prohibit false trade descriptions; to render illegal the acceptance of secret trade commisssions; to allow of the protection of union trade-marks in common with those of the trading community; and dealing with other matters of importance.

In touching thus sketchily upon the work of the various Parliaments of Australia since the Labor party has arisen, the writer attempts to do no more than indicate the trend of legislation as affecting the working classes and bearing upon social problems generally. In both the State and Federal Parliaments, during the time covered, many other important laws have been passed, and in regard to these the Laborites have borne their share of the work involved. It is, however, to the Labor party that credit is mainly due for the quickening of the public conscience which has resulted in so many ameliorative measures being passed in a comparatively short period.

The Labor party has been accused of concerning itself only with the interests of the working classes; but gradually it is being recognized that the term "Labor" includes brain as well as hand workers, and all sympathizers are welcomed as members of the political organizations. The Labor parties in Parliament include a fair sprinkling of professional and business men, who in any narrow interpretation would be excluded. There is no doubt that much of the success so far achieved is due to the recognition of the fact that the interests of all producers are identical and that justice must be extended to all equally.

Much has been said about the socialism of the Australian Labor Party, and it is alluded to by some as a recent development. That is not so, as there has been no change, except perhaps in form, in the aims and programme as first put forward. Leaving aside the fact that nearly every plank of the original platform was broadly socialistic in its interference with individualism, distinct aspirations toward collectivism were voiced in the first declarations of the party. In Queensland this took the most pronounced form, where as early as 1890 the council of the Australian Labor Federation, having decided upon political action, put forward as its aim "The nationalization of all sources of wealth and all means of producing and exchanging wealth." This was a declaration for complete socialism, but the organizations in the other colonies refused to go that distance. The New South Wales League in 1890 adopted a proposal for "the extension of the principle of the Government acting as an employer, through the medium of local self-governing bodies," and thus committed itself to socialistic ideals. In some of the other colonies declarations of principle were considered unnecessary, and the platforms contained no direct mention of socialism, though many of the detailed proposals were of a socialistic character. Later on, the Queensland organization dropped for a time any direct reference to socialism, but continued its propaganda on collective lines. In 1897 New South Wales adopted as a plank of its platform "the nationalization of the means of production, distribution, and exchange," and that remained on the programme until 1905, when it was struck out. At the same conference a statement of the local party's objective was agreed to, which has since been adopted by an Australian conference as the objective of the Federal Labor party, and may be here quoted: "(1) The cultivation of an Australian sentiment, based upon the maintenance of racial purity and the development in Australia of an enlightened and self-reliant community. (2) The securing of the full results of their industry to all producers by the collective ownership of monopolies and the extension of the industrial and economic functions of the State and Municipality."

The dropping of the «whole hog» plank in favor of this statement of aims was looked upon as a retrograde step by the more ardent socialists in the movement; but it appears to have been dictated by common sense. The platform is theoretically a programme for realization when the party gets a majority, and it is clearly impracticable to attempt to carry out any complete scheme of socialism to-day. Recognizing this, the party declares its belief in socialistic principles, and adjusts its programme so that every step taken will be in consonance with that ideal. This is shown in the platform for the next Federal elections, due at the end of 1906, which is as follows:

1. Maintenance of a white Australia.
2. Nationalization of monopolies.
3. Old-age pensions.
4. Tariff referendum.
5. Progressive tax on unimproved land values.
6. Restriction of public borrowing.
7. Navigation laws (provision for manning, etc.)
8. Citizen defence force.
9. Arbitration act amendment (ensuring effectiveness).
10. Commonwealth of deposit and issue and life and fire insurance department.
11. Uniform industrial legislation; amendment of constitution to provide for same.
12. Civil equality of men and women.

This platform insists that monopolies shall be nationalized, as constituting a public danger, and the Labor party expresses its disbelief in the efficacy of measures designed to merely regulate modern trusts. Under its objective the party will embrace every opportunity of extending the functions of collective authority where it is shown to be practicable and of value to the community. From this statement of the position it will be seen that the Labor party is undoubtedly socialistic, but it does not propose to plunge Australia suddenly into any experiment of a wholesale character. The people have control in respect of each successive step, and may be relied upon to call a halt if at any stage failure is experienced.

On the whole, the Labor party throughout Australia has given a much-needed impetus to social legislation; and, in reply to those who urge that its objects and methods are opposed to the welfare of the community, it points to the fact that since its appearance in Australian politics wealth has found a wider distribution; hours have been shortened and wages raised in many occupations; sweating has been minimized; and that, though much remains to be done, the people enjoy greater prosperity than before the advent of the new political force.

J. C. Watson,
Premier of Australia 1904.

14. Australia — Social Conditions. The social conditions of a country may be considered from different points of view. They might be considered from the general welfare of the people, or from what is known as social distinction in society. This last aspect of the question could be disposed of in a few words so far as Australia is concerned. The people mostly belong to the great class of honest industry in one form or another. The large majority are, if necessity requires, willing to undertake almost any kind of work, while those who are wealthy, with but few exceptions, prefer useful or philanthropic employment to a life of idle dissipation.

The common weal of the people is indicated by the fact that in no country is there less real poverty than in Australia, or better and more systematic organization for dealing with those few persons who are in need of temporary assistance. No one is ever knowingly allowed to suffer for want of food. The State does not consider it to be its duty to find employment for those who may be out of work, but in the interest of humanity it always provides food for those in want of it.

It has been said that the happiest people are those who can live upon the products of their own country. Australia offers greater possibilities for such happiness than almost any other land. Cattle and sheep, pigs, and poultry, all kinds of grain, vegetables of every variety, and nearly all known fruits are easily produced by properly applied industry.

Primary Productions.— Sir George Sydenham Clarke, G. C. M. G., who was Governor of Victoria for some years, recently said: «It may be taken as certain that where the averages from primary production stand high the country is a good one.» This dictum has such a direct bearing upon the condition of the people that the comparisons become important. According to population the primary production in Australia is about 40 per cent greater than in Canada, 57 per cent greater than in the United States, twice as great as in France, three times as great as in England, and over four times as great as in Russia.

The productive nature of the soil and climate has a great deal to do with the fact that a greater number of people in Australia, in proportion to its population, enjoy more of the comforts and pleasures of life than is the case in many other parts of the world. The people as a whole are better housed, fed, and clothed than the residents of most other countries. Cheap houses and discomforts are to be found in Australia as elsewhere, but even in the cities there is a lack of the poor shanties and tenements which are so noticeable in many large cities in Europe, Asia, and America.

Educational Advantages.— No one question has a more important or direct bearing upon the social conditions of the people than that of education. No country has better facilities, and but few as good, and with the exception of some parts of America, Australia affords as good an opportunity for secondary and advanced education at a moderate cost as any other country.

Generally speaking, the system of public education is free, compulsory, and secular, the whole expense being met out of the general revenue. The greatest care is taken to provide schools in every part of the country as well as in the thickly populated cities, and in some of the thinly settled districts, schools of from 10 to 15 children are established. Fortunately, Australia's educational advancement has not been delayed by sectarian interference. There it is generally considered that a country's advancement rests on the education of its people, and that as national education is a national gain, the nation's treasury should meet the bill. Efforts have been made from time to time by zealous propounders of sectarian beliefs, to incorporate religious instruction with the Education Acts of the different States, but the majority of the people are strongly opposed to any form of State aid to religion. They feel that in the bitter strife for sectarian supremacy the efficiency of the schools

would become impaired and the practical education of the children neglected. A large majority of parents take advantage of the public schools for their children, but for those who object, either from class prejudice or religious scruples, good private schools are available.

The technical schools, colleges and universities afford ample facilities for higher education. The Australian universities stand high in the educational world. By bequests, endowments, and grants of land they have been enabled to provide splendid buildings and appliances, and to procure able and learned professors. The degrees conferred are recognized and respected in other lands. No one need leave Australia to become well versed in music, medicine, literature, law, or science. The technical schools have been especially valuable from a mining point of view, and many of those who have received their instruction there are now holding important positions on mining fields in Australia and other countries. Nearly 1,300 public libraries with 2,000,000 volumes of valuable literature are a great help to those who have passed on beyond school life. In all the principal cities there are public museums and art galleries, which are largely patronized, and have an elevating and refining influence. See AUSTRALIA — EDUCATION; EDUCATION — NATIONAL SYSTEMS OF.

Religious Instruction.— The secular and nonsectarian nature of the public schools does not imply that the religious instruction of the people is neglected. Churches of every known denomination are well supported. Sunday schools, Christian endeavor societies, and young men's and young women's Christian Associations are well attended, and all doing good work, while the Salvation Army has its branches stretching over every part of the land, and is to be commended for its tireless endeavors to reclaim the drunkard, lift up the oppressed, and to bring back to the paths of virtue and truth those who have strayed or fallen by the wayside. Temperance organizations of various kinds have many members, and are a powerful factor in preserving the better, simpler, and purer life of the community. See AUSTRALIA — RELIGION.

Government Institutions.— The Governments of the different States look after the poor, the sick, and the afflicted. They have destitute homes where the aged are properly housed, fed, and cared for. They have hospitals for the sick, where those who cannot afford to pay are nursed, and attended equally with those who can. Asylums for the insane, sanatoriums for the consumptive, while homes for incurables, and schools for the blind, deaf and dumb are either supported or subsidized by the Governments. Genuine workingmen, if unable to obtain employment, are allowed to do certain work to pay for the food which is provided for them and their families. Such relief is of a temporary character until more permanent employment is secured.

Benefit societies and insurance companies have been established in every State, and number their members by many thousands. These have a marked effect in encouraging provident habits, and, with the temperance societies, are valuable aids in teaching frugality and moderation, which are notable characteristics in the Australians.

Some of the States have adopted a system of Old-age pensions, and a Royal Commission has recently reported favorably on a scheme for the whole Commonwealth.

Out-door Life.— For those who are fond of an out-door life Australia is an ideal country. The climate is such that one can practically spend the whole year in the open air. The advantages of fresh air have been wisely considered by those who had to do with laying out cities and towns, as well as those connected with the government of the country. Wide streets, squares, and parks are to be found in and adjacent to all the cities, while large tracts of land have been reserved as national parks within a few miles of the centres of population.

This affords every opportunity for out-door sport of all kinds. Rowing, football, cricket, lacrosse, golf, baseball, and almost all other outside games have numerous patrons. In fact, games and sport are carried on so extensively that tourists have criticized Australians for indulging so much in them. Numerous holidays, reasonable hours for work, and long, fine days offer every inducement. Australians are decidedly a sport-loving people. The Melbourne Cup is one of the world's greatest racing events, and the Flemington grounds with their commodious stands and extensive lawns are unsurpassed in any part of the world. The roads are so well made that motoring and cycling are greatly indulged in. Many residents own motors, and during the last few years money has become so plentiful that vehicles for pleasure have been purchased in large numbers.

Wealth of the People.— It is not generally known that the Australians are the richest people in the world, except the residents of England, and a good many of these draw their incomes from Australian investments. During the present year (1906) Australia will export produce of a greater value than ever before. The distribution of wealth is more general than in most other parts of the world. Over 30 per cent of the adult population are possessors of property, while in England only about 12 per cent of the adult population enjoy that privilege. There are 1,100,000 depositors in the savings bank, being 27 per cent of the entire population, and they have to their credit $175,000,000, an average of about $160.

Laws and Socialism.— Taking an active and responsible part in the management of national affairs has a moderating effect upon most politicians, and to a large degree they have recognized the responsibility of office and endeavored to safeguard the country's interest.

The voice of the people can be made fully known through the ballot-box. The judgment of the public may not always be considered the wisest for the country's advancement, but when the error is discovered the same power that caused it can apply the remedy. The Australian Commonwealth franchise is the broadest and most liberal possible. Everyone over the age of 21 (except criminals and lunatics) has the right to vote. In some of the State elections as well, women have the privilege. There were many strongly opposed to woman's franchise. All the arguments about taking her from her home, destroying her womanly instincts, causing her to neglect her proper duties, etc., were indulged in. After the law was passed, how-

1-5. Clubs from the Marquesas Islands.
2, 9. Carving from Hervey Islands.
3. Shell Ornament from the Solomon Islands.
4, 7, 14. Carved work from New Guinea.
6. Australian Carving.
8. Steering Oar, from New Zealand.
10. New Zealand Pipe.
12. Australian Carved Ornament.
16. Carved Shield from New Guinea.

ever, those who previously opposed it, quickly realized (especially if they were parliamentary candidates) that woman was highly intelligent and that it was her duty in the interest of the country to vote.

Australia's socialism has grown with her people. It has not meant the destruction of private property. The State railways, harbors, water-works, telegraphs, telephones, wharves, exporting departments, public schools, and other undertakings, have naturally followed one after the other, and have not been a hardship to the capitalists, but have rather been the means of allowing them to invest their money in other undertakings and thereby assist in opening up the pastoral, agricultural, and mining industries.

Many of Australia's laws have been passed on the belief that the Government could undertake certain things for the assistance of the people at less expense than this assistance could be carried out privately. National credit, as a rule, is much better than individual credit. Money can be borrowed by the State and lent to producers on better terms than it can be borrowed by private people for that purpose. Under certain laws the well-to-do pastoralists, as well as the poorer producer, can be assisted. It is necessary to understand Australian life to realize the need for assistance to pastoralists. The Governments own most of the lands; hundreds of miles of which are let on lease to pastoralists. Wire netting has been found to be the most effective means of protecting the sheep from wild dogs, and of keeping the rabbits down. For the lessee on his own account to undertake to fence his leasehold would mean an expense which would be a heavy burden upon him, and prevent the use of his capital for other improvements; so by combining with adjoining lessees they form a vermin trust, and apply to the Government for miles of wire netting; this is supplied upon the joint security of the lessees and they repay the Government, with interest, in instalments extending over a number of years. Large sums have been lent in this way, and, but little if any loss has occurred, and it has been the means of stocking much land that would otherwise have remained idle. The Governments also assist the farmers by loans from State Banks at low interest, a long term of years being allowed for repayments. Blockers, who only have a few acres, are also assisted, and under certain conditions they borrow from the Government to help build their houses and carry out other improvements. All these loans are only granted on business principles, after the officers of the Land Departments have made full inquiries as to necessary security. The Governments also largely assist in exporting produce and finding outside markets. This business is conducted on commercial lines, certain charges being made for the storage, freezing, and work done. If the producer is in need of ready money before his goods are disposed of an advance is made by the Government. All this may be considered Socialistic; however, upon a moment's reflection it will be seen that it is only an assistance to further stimulate individual enterprise and effort. It has carried many a struggling producer over early years of hardship, and probably saved his property for his family when under other circumstances it might have gone into the hands of the mortgagee.

Charges, Rates, Taxes.— Railway charges are, if anything, less than on the roads owned and worked by private companies in other countries. The conveniences for traveling are good. The Government control of water-works and sewage systems for the large cities has proved economical and satisfactory. The land-tax is not heavy enough to be burdensome. Municipal and local rates are low in comparison with England. The total rates in the Australian cities, including water rates, on property worth $500 per annum, would be from $50 to $100, while in and around London it would be from $150 to $300.

Employer and Employee.— The relations between the employer and the employee are generally harmonious; occasionally disputes may arise but they are nearly always settled without those long strikes which result in heavy loss to both resisting forces and engender so much bitterness of feeling. The employers as a rule pay good wages, the hours worked are short, and the employees are provided with favorable sanitary and safety conditions. Being thus satisfied that their treatment is just, they in their turn do their best to give full value in their work for the wages they receive.

Literature, Art, and Song.— According to Mr. Coghlan, who is a statistical authority, Australia has as large a number of first-class newspapers, considering its population, as any other country in the world, while in the matter of letter-writing the only two countries that surpass it are the United States and England.

That Australians have a taste for literature cannot be denied; what they read may not always be of the highest standard, and what they write may sometimes lack artistic finish, but one must recollect that theirs is comparatively a new country. Its real growth has taken place during the last 50 years. Other countries have not risen rapidly to literary fame. The first settlements of America were made two centuries before the world had the benefit of Irving, Longfellow, Emerson, or Lowell. England's men of letters were not numerous or renowned until many generations had passed away.

While in literature Australia may not up to the present have produced writers of marked distinction, yet there are those of more or less note whose productions are of no small merit, and who have thrown the bright sunshine and free life into their work. The same may be said of art. While no one person stands out as a producer of highly valuable pictures there are several who have the true artist's spirit, and have made creditable displays at the Royal Academy in London and the Salons of Paris. But when one considers musical artists, Australia has no need to feel ashamed. With the climatic conditions it naturally follows that those who are musically inclined have succeeded; and to-day, in proportion to her population, Australia is stated to have more prominent musical talent of world-wide reputation than any other English-speaking country.

Taking the residents of Australia as a whole they are a happy, prosperous, and contented people. They have of course the political and theological differences which are common to all

nations. The leaders of public thought endeavor to convince by reason, not by force. Occasional dissatisfaction is expressed. It is questionable, all things considered, whether any country in the world is more congenial as a place of residence for the following reasons: The death-rate is lower, the primary production is greater, the wages are higher, the standard of living is better, the houses are more substantial, and surrounded with more land, the hours of labor are shorter, telegraphic communication is cheaper, the weather is brighter, the laws more liberal, the wealth more evenly distributed, and class distinctions fewer than in almost any other country.

Besides all this, Australia, in the matter of language, is more English than England or America. One can hear more foreign languages spoken in New York or London in a day than could be heard in Australia in a year.

JOHN G. JENKINS,

Agent-General for South Australia, and Premier 1901–1905.

Austra'lia, South, one of the original states in the Commonwealth of Australia. It occupies the middle of Australia, and at first, as the colony of South Australia, extended between lon. 132° and 141° E., and from the Southern Ocean to lat. 26° N., having then an area of about 300,000 square miles. In 1861 a district lying to the west of the colony was added to it, so that its western boundary was shifted to the meridian of 129°. In 1863 it received in addition the country between its northern boundary and the opposite coast (this portion being now known as the Northern Territory), so that South Australia now possesses a territory extending across Australia, and occupying an area estimated at 903,690 square miles. It is bounded on the east by Victoria, New South Wales, and Queensland; on the west by Western Australia. Its greatest length from north to south is 1,850 miles, and its width 650 miles. The south coast, for the first 120 miles east of where it begins at Port Eucla, is backed by steep limestone ranges from 400 to 600 feet in height, but as a whole the coast is low and desolate-looking. In a straight line from Port Eucla on the west to Cape Northumberland, near the boundary of Victoria, the distance is 850 miles, but the coast-line between these points extends to nearly twice that distance, owing to the indentations of Spencer Gulf and the Gulf of St. Vincent. Opposite the latter is Kangaroo Island, the largest island on the Australian coast, excepting Tasmania. The coast of the Northern Territory is thickly strewn with islands, three of which are of large size. There are also some excellent ports, one of these, Port Darwin, where the overland telegraph and the cable from Batavia and the East meet, being among the finest harbors in Australia. On the eastern side of the Gulf of St. Vincent lie the most populous portions of the state, and here is situated Adelaide, the state capital.

The interior formation of South Australia widely differs from that of the more eastern states. The mountains here run from the sea to the interior, ending somewhat abruptly among the lakes. The principal chain, the Mount Lofty range, begins at Cape Jervis, and follows the shore of the Gulf of St. Vincent past Adelaide, meeting at the head of the gulf, the ridges forming the backbone of Yorke Peninsula. The range still running north is called Flinders range, and ends in a wide mass of mountain 3,000 feet high, separating the lakes Torrens, Eyre, Frome, and Blanche. All these so-called lakes are huge expanses of salt water, swamp, and mud. On the west of Spencer Gulf is Eyre Peninsula, through the heart of which runs the Gawler range, attaining an elevation of 2,000 feet, and ending on the shores of another series of lakes of the same character as Lake Torrens. The principal summits of the Mount Lofty range are Razor-back, in latitude 33° 20′, and immediately north of it Mount Bryan, close to which is the celebrated Burra-Burra copper mine. The highest peaks of the Flinders range are Mount Remarkable, 3,179 feet, Brown 3,174 feet, and Arden 3,000 feet. None of the peaks in the Gawler range attain more than a moderate elevation. On the left bank of the Murray, and near its mouth, a range of moderately elevated heights proceed south-southeast, skirting the coast to its extremity near Cape Northumberland. Throughout these ranges the existence of volcanic agency at a former period is everywhere apparent. The Warburton range and the Stuart ranges lie beyond and to the north and west of the lakes; further north on the Tropic of Capricorn, are the MacDonnell ranges, rising to a height of 4,000 feet, from which the extreme western affluents of the Lake Eyre River system take their rise. The other portions of the territory to the north and west are almost level, and consist of either waterless plains or plains of sandstone boulders, with desert grass and spinifex.

Among the mountains east of Gulf of St. Vincent, primitive limestone, often in the form of a beautiful white marble, is very abundant. There are indications of a large variety of minerals throughout the state, but copper is the only one that has been met with in large quantities, the total production to the end of 1899 being valued at £23,000,000. Gold has been found in various places, but the quantity won has been small. In the Northern Territory gold has also been found over a considerable tract of country, and good progress has been made in mining, while other minerals are known to exist. Almost the only stream within the state proper, which deserves the name of river, is the Murray, which enters the colony on the east in latitude 34°, and flows first circuitously west and then south, into the extensive lagoon called Lake Alexandrina, communicating with the sea by a narrow opening. During the rainy season it is navigable by steamers through its whole course within the state, and for 1,500 miles in New South Wales. In the Northern Territory the Roper River is a fine large stream, navigable for sea-going vessels for 100 miles from its mouth in the Gulf of Carpentaria; the Victoria is also navigable. The climate of South Australia proper greatly resembles that of Sicily and Naples. During nine months of the year it is agreeable, the disagreeable portion of the year being the three summer months of December, January, and February, when the natural heat of the season is greatly increased by hot winds from the interior. What is called winter would be considered in England merely a wet autumn. There are no epidemic diseases. Scrofulous and tubercular diseases are rare, but diseases of the eyes are common in summer, being either occasioned by the impalpable dust floating in the atmosphere, or by exposure to the night air after the glare of the sun.

South Australia produces nearly all the fruits and vegetables that are cultivated in Europe, as well as others, but in temperate regions is chiefly distinguished as a wheat and grape-growing country. Besides supplying its own wants, it sends large quantities of wheat to the neighboring states and to Europe, where "Adelaide" wheat is held in high estimation. The area under wheat is about 1,750,000 acres. The quantity produced varies greatly with the season, but the average production is six bushels per acre. The area under vineyards is gradually extending, and now approaches 20,000 acres. Brandy is produced as well as wine. Hop-growing is attracting some attention, and the olive is also cultivated. The value of the exports of the state is £7,100,000, and of the imports £7,300,000, total £14,400,000. The chief exports are wool, wheat, flour, copper, and copper ore, skins, etc. The value of the wool exported is generally about £1,000,000, and of

wheat and flour from £800,000 to £1,500,000, according to the season. The trade of a large part of New South Wales passes through South Australia. The revenue and expenditures are each about £2,700,000. The length of railways is 1,890 miles. There is a complete system of telegraphs, besides the great line from Adelaide across the continent to Port Darwin, a distance of 2,000 miles. The public debt of the state is £24,309,035, and has been mostly incurred for reproductive public works. See AUSTRALIA; AUSTRALIAN FEDERATION.

Austra'lia, Western, one of the original states in the Commonwealth of Australia. It includes that portion of Australia west of lon. 129° E., and is bounded, east by South Australia, and northwest, and south by the Indian Ocean. It lies between the parallels of 13° 30′ and 35° 8′ S.; greatest length, 1,450 miles north to south; greatest breadth, 850 miles; area, 975,920 square miles. The coast-line measures about 3,000 miles, and, except on the south is indented by numerous bays, creeks, and estuaries. The coast is fringed by many islands, but none of any importance. The principal inlets are Cambridge Gulf, Admiralty Gulf, York Sound, Collier Bay, King Sound, Roebuck Bay, Exmouth Gulf, Shark Bay, Geographe Bay, and King George Sound, the last the most important as having Albany on its shore, the port of call for the European mail steamers. The chief rivers are the Ord and Fitzroy on the north, De Grey, Ashburton, Fortescue, Gascoign, Murchison, Greenough, Swan, and Blackwood on the west. The Swan River is important, as Perth, the capital, is situated on its banks. Some of the rivers within the tropics are large and navigable, but few of the others run all the year, and fewer still are navigable even for boats to any great distance. The interior was till recent years not well known, but at present there is little territory which has not been explored. The country is chiefly an alternation of ridges and hollows, sandy, without grass, and clothed with bushes and scrubby timber, without the trace of a water-course. The really settled and occupied portion of the state forms only a mere fraction of its whole area. The population is mostly collected in the southwest corner, where the first settlements were made, and around the recently discovered gold reefs. Scattered settlements stud the coast at various points. On the west coast are extensive banks covered with the pearl oyster, which give employment to a fleet of boats. The Kimberley district in the north is a region of great promise; it comprises 20,000,000 acres of well-watered land intersected by the Fitzroy River and other large streams, and is said to be admirably adapted for pastoral purposes, besides having a large area suitable for the cultivation of sugar, coffee, and rice. The greater part of the seaboard, except along the Australian bight, is separated from the interior by a low range of hills running parallel to it, and covered with forests. The fertile land exists in patches, and some of it is of a very rich character. The principal crops are wheat, barley, hay, and potatoes; the vine is also successfully cultivated, and excellent wine is made in the colony. The area under cultivation comprises about 140,000 acres, of which wheat occupies 42,000 acres, hay 84,000 acres, vines 2,750 acres. The live stock in 1899 numbered 2,210,000 sheep, 245,000 cattle, 62,000 horses, besides a large number of camels, pigs, goats, and poultry. An available area of 1,000 square miles is covered with jarrah forests. The jarrah is a species of eucalyptus (*E. marginata*); its timber is in great request for railway sleepers, for building purposes, and especially for marine constructions, having the valuable property of resisting the attacks of the white ant on land and the ship worm at sea. Considerable areas in the southwest are covered with karri (*E. diversicolor*). There are also numerous forests of sandalwood trees, the timber of which is exported in large quantities, chiefly to China for incense purposes. Flowers and fruits from all quarters of the globe grow luxuriantly. Among the fruits successfully cultivated are apples, pears, oranges, peaches, plums, apricots, figs, almonds, bananas, olives, etc. English vegetables may be profitably cultivated at almost all seasons. Bees thrive and produce abundant stores of honey.

The mineral resources of the state are not yet fully known. Gold has been discovered in large quantities, and Western Australia is now the chief gold-producing state of Australia, the Coolgardie gold fields being among the most productive. In 1899 the gold exported had the value of £6,246,731. Lead and copper exist abundantly, and several mines are in operation. Iron ore might be raised in almost inexhaustible quantities, and tin also exists. The gold discoveries have formed an epoch in the history of the state, and trade and population have recently increased very rapidly. The imports, which in 1887 were valued at £830,000, amounted in 1899 to £4,474,000, the exports in the latter year being £6,985,000. Besides gold the exports include wool, jarrah and karri timber, sandalwood, pearls, pearl shells, tin ore, skins, etc. The revenue has grown enormously. In 1881 it was £206,205; in 1891, £497,670; and in 1898, £2,754,747. The public debt is £9,203,738, equal to £53 16s. 8d. per inhabitant. There are about 1,400 miles of railway open. The principal towns are Perth, the capital, and Fremantle, which is the chief port. The first part of the state settled was the southwest corner, long known as the Swan River Settlement, established in 1829. From 1850 to 1868 it was a place for the transportation of convicts. In 1890 the state received a system of responsible government similar to that prevailing in the other colonies of Australia.

Austra'lian Alps, a range of mountains in the southeast of Australia, extending over a length of about 400 miles. The highest peaks are in New South Wales, and the highest, according to Lendenfeld, is Mount Townshend (7,353 feet), belonging to a group which he calls the Kosciusko group. The peaks next in height belong to the Bogong group in Victoria, and the west of the Mitta Mitta, the highest of which is Mount Bogong (6,508 feet). They do not reach the snow line, though snow lies in the higher valleys all the summer. Geologically, the Australian Alps are composed mainly of very ancient metamorphic rocks, which have been worn down in the course of ages to table-lands, and which slope down rather steeply on all sides. Volcanic rocks cover the table-land to the south of Mount Bogong.

Austra'lian Bal'lot. See BALLOT.

Austra'lian Federation, the political union of the five Australian colonies, together with Tasmania. The first convention looking to this end was held at Hobart in January 1886. The colonies represented were Victoria, Queensland, Tasmania, Western Australia, and Fiji. Another conference took place in 1891, at Sydney, New South Wales, attended by delegates from each of the colonies. A plan of federal government was proposed, resembling in many of its features that of the United States. A draft bill to constitute the Commonwealth of Australia was adopted by the convention, and it was agreed to submit it to the approval of the individual legislatures of the several colonies. This bill met with success in the lower branch of but one colonial legislature — that of Victoria. In January 1895 there was a conference of premiers of five colonies at Hobart, and the Legislative Assembly of New South Wales passed a federal enabling act in November of that year, and notice of motion was given in other legislatures to bring in a similar bill. The first practical step was taken in 1898. A convention of representatives of New South Wales, Victoria, Tasmania, South Australia, and Western Australia, succeeded in drafting a constitution, which was submitted to the popular vote of each of those colonies in June. The constitution provided for a governor-general, appointed by the Crown; a federal parliament, composed of the Crown, represented by the governor-general, a Senate, and a House of Representatives. The powers of the parliament were set forth in 39 articles, and covered trade with other countries, taxation, coinage, weights and measures, foreign corporations, pensions, arbitration, etc. Free trade between the states was recognized. By the terms of the plebiscite, an affirmative vote of substantially one third of the electors of New South Wales, and of one fifth of the electors of each of the other colonies, was required to adopt this constitution. But the election returns in June were fatal to the scheme. While the majorities in the four lesser colonies were overwhelmingly in favor of the constitution, the requisite affirmative vote in New South Wales was not obtained.

On 2 Feb. 1899, a unanimous agreement was reached by the colonial premiers in conference at Melbourne, regarding the unsettled questions referred to them by the colonial legislatures, thus insuring the success of the federation project. In 1900, a bill making federation effective was introduced into Parliament, at London, and passed, the only amendment offered having reference to the royal prerogative. Later in that year the Earl of Hopetoun was appointed by the queen first governor-general. He resigned in May 1902.

Austrasia, âs-trā'shĭa (the East Kingdom), the name given, under the Merovingians, to the Eastern possessions of the Franks, embracing Lorraine, Belgium, and the right bank of the Rhine. These districts, thickly inhabited by Franks, were of great importance at the time of the rise of the Frankish power.

Aus'tria (from the German OESTREICH or OESTERREICH, eastern empire), or AUSTRIA-HUNGARY, the collective designation of several states of central Europe, consisting of two semi-independent countries, each with its own parliament and government, but with one common sovereign, army, and system of diplomacy, and also with a common parliament.

History of the Country till the Year 982.— After the Romans had vanquished the Noricans, 33 A.D., and gained possession of the Danube, the country north of the Danube, extending to the borders of Bohemia and Moravia belonged to the kingdom of the Marcomanni and Quadi; a part of lower Austria and Styria, with Vienna (Vindobona), a municipal city of the Roman empire, belonged to upper Pannonia; the rest of the country, with Carinthia and a part of Carniola, formed a portion of Noricum. Gorz belonged to the Roman province of Illyricum, and Tyrol to Rhætia. These limits became confused by the irruptions of the barbarians. The Boii, Vandals, Heruli, Rugii, Goths, Huns, Lombards, and Avars, in the course of the 5th and 6th centuries, successively occupied the country. But after the year 568, when the Lombards had established their power in upper Italy, the River Ens formed the boundary line between the German tribe of Bajuvarii, the proprietors of the territory above the Ens, and the Avars, who had removed from the east to the banks of that stream. In 611 the Wendi, a Slavonic tribe, appeared on the Murr, Drave, and Save. In 788 the duchy of Bavaria was dissolved, and the Avars passed over the Ens and invaded the counties of the Franks in the Bavarian territory. In 791 Charlemagne forced them to retire to the Raab, and united the territory extending from the Ens to the junction of the Raab with the Danube (the territory below the Ens) with Germany, under the name of Avaria, or the Eastern Mark (Marchia Orientalis), or Austria; and in the 10th century (in a document of Otho III. 996) it was called Ostirrichi, equivalent to the modern Oesterreich. Many colonists, particularly from Bavaria, were sent by Charlemagne into the new province, and a margrave was appointed to administer the government. The archbishop of Salzburg was at the head of ecclesiastical affairs. After its separation from Verdun, in 843, Avaria formed the east boundary of the German empire. On the invasion of Germany by the Hungarians, in 900, Avaria fell into their hands, and was held by them till 955, when the Emperor Otho I., in consequence of the victory of Augsburg, reunited a great part of this province to the empire. By the power and address of its margraves the whole country was joined again with Germany, and in 1043, under the Emperor Henry III. and the Margrave Albert I. (the Victorious), its limits were extended to the Leitha.

Austria under the House of Bamberg till 1282.— From 982 to 1156 the margraviate of Austria was hereditary in the family of the counts of Badenburg (Bamberg); the succession, however, was not regulated by primogeniture, but by the will of the emperor. In ancient documents mention is made of the estates of Austria in the year 1096. After Henry the Proud (Duke of Bavaria and Saxony) was put under the ban of the empire, Leopold V., margrave of Austria, received the duchy of Bavaria in 1138 from the Emperor Conrad. But when the Margrave Henry, son of Leopold, under the title of *Ja-so-mir-Gott* (Yes-so-me-God), had again ceded it, in 1156, to Henry the Lion, the boundaries of Austria were extended so as to include the territory above the Ens, and the

whole was created a duchy with certain privileges. Under this Duke the court resided at Vienna. Duke Leopold VI., the son of Henry, received the duchy of Styria in 1192 as a fief from the Emperor Henry VI., it having been added to the empire by Otho I., in 955, by his victory over the Hungarians. It was this prince who imprisoned Richard Cœur de Lion, king of England. Duke Leopold VII., the youngest son of the former, erected a palace within the city of Vienna, which was long occupied by the Austrian monarchs, under the name of the old castle. Leopold VII., called the Glorious, established the hospital of the Holy Cross, made Vienna, which had adopted a municipal constitution in 1198, a staple town, and granted 30,000 marks of silver for the promotion of trade and commerce. In 1229 he purchased a part of Carniola from the ecclesiastical principality of Freisingen for 1,650 marks, and left the country in a flourishing condition to the youngest of his three sons, Frederick II., surnamed the Warrior. In 1236 this prince was put under the ban of the empire, on account of his joining the alliance of the cities of Lombardy against the Emperor Frederick II.; and Otho, Duke of Bavaria, seized upon his territory above the Ens as far as Lintz. The rest of the country was granted, as a fief by the emperor, to a margrave, and Vienna became an imperial city.

During the emperor's campaign in Italy Duke Frederick recovered the principal part of his lands, and his rights were confirmed by the emperor at Verona, 1245. The rights of Vienna as an imperial city were abolished, and Frederick was to be called king, as sovereign of Austria and Styria; but all his expectations of empire were disappointed by his death in the battle of the Leitha against Bela IV., king of Hungary, 15 July 1246, in the 35th year of his age. Thus the male line of the house of Bamberg became extinct. The period from 1246 to 1282 is styled the Austrian interregnum. The Emperor Frederick II. declared Austria and Styria a vacant fief, the hereditary property of the German emperors, and sent a governor to Vienna, the privileges of which, as an imperial city, were once more renewed. But the female relations of the deceased Duke Frederick, his sister Margaret (widow of the Emperor Henry VI), and his niece Gertrude, by the persuasion of Pope Innocent IV., in 1248, laid claim to the inheritance of their brother. The Margrave Hermann, with the aid of the Pope and a strong party, made himself master of Vienna, and of several Austrian cities. In Styria he was opposed by the governor Meinhard, count of Görz. But Hermann died in 1250, and his son Frederick, who was afterward beheaded in 1268, at Naples, with Conradin of Suabia, was then only a year old. The whole country was distracted by various parties, and the Emperor Conrad IV. was prevented, by disputes with his neighbors, from turning his attention to Austria. In 1251 the states of Austria and Styria determined to appoint one of the sons of the second sister of Frederick the Warrior, Constantia (widow of the Margrave Henry the Illustrious) to the office of Duke. Their deputies were on the way to Misnia when they were persuaded by King Wenceslaus, on their entrance into Prague, to declare his son Ottocar Duke of Austria and Styria, who made every effort to support his appointment by arms, money, and especially by his marriage with the empress widow Margaret. Ottocar wrested Styria from Bela, king of Hungary, by his victory of July 1260, in the Marchfield; and in 1262 forced the Emperor Richard to invest him with both duchies. Soon after, by the will of his uncle Ulrich, the last Duke of Carinthia and Friuli (who died 1296), Ottocar became master of Carinthia, a part of Carniola connected with it, the kingdom of Istria, and a part of Friuli. But his arrogance soon caused his fall. In 1272 he refused to acknowledge Count Rudolph of Hapsburg emperor, and was obliged to defend himself against Rudolph. After an unsuccessful war he was forced to cede all his Austrian possessions in November 1276. In 1277 he attempted to recover these territories, but, in the battle of the Marchfield, 26 Aug. 1278, he was slain, and his son Wenceslaus was obliged to renounce all claim to them, in order to preserve his hereditary estates. The Emperor Rudolph remained three years in Vienna, and then appointed his eldest son governor. But having succeeded in gaining the consent of the electors of Saxony and Brandenburg, of the three ecclesiastical electors, and of the count-palatine of the Rhine, he granted the duchies of Austria and Styria, with the province of Carinthia, to his two sons, Albert and Rodolph, 27 Dec. 1280.

Austria under the House of Hapsburg.—I. From 1282 to 1526. Albert and Rodolph transferred Carinthia to Meinhard, count of Tyrol, father-in-law to Albert. In 1283 they concluded a treaty, by which Albert was made sole possessor of Austria, Styria, and Carniola. Vienna, having again renounced its privileges as an imperial city, was made the residence of the court, and the successors of Rodolph, from this time, assumed Austria as the family title. The introduction of the Hapsburg dynasty was the foundation of the future greatness of Austria. The despotic Albert was assailed by Hungary and Bavaria and in 1298 he won the Roman crown in an engagement with Adolphus of Nassau. After this he undertook the conquest of Switzerland; but was assassinated 1 May 1308, at Rheinfelden, by his nephew, John of Suabia, from whom he had basely withheld his hereditary estates. The inheritance of John now fell to the five sons of the murdered Albert—Frederick, surnamed the Fair, Leopold, Henry, Albert, and Otho. They were forced to purchase of the Emperor Henry VII. the investiture of their paternal estates (consisting, in 1308, of 26,572 square miles) for 20,000 marks of silver. Under their father, in 1301, the margraviate of Suabia was added to the territories of Austria, and the contest with Bavaria ended in Austria obtaining Neuberg. On the contrary, the attempt of Duke Leopold, in 1315, to recover the forest towns of Switzerland, which had been lost under Albert, was frustrated by the valor of the troops of the Swiss confederacy in the battle of Morgarten. In 1314 his brother Frederick, chosen emperor of Germany by the electors, was conquered by his rival, the Emperor Louis (of Bavaria), in 1322, at Mühldorf, and was his prisoner for two years and a half in the castle of Trausnitz. The dispute with the house of Luxemberg, in Bohemia, and with Pope John XXII., induced the emperor, in 1325, to liberate his captive.

Upon this the latter renounced all share in the government, and pledged himself to surrender all the imperial domains which were still in the possession of Austria. But Leopold considered the agreement derogatory to his dignity and continued the war against Louis. Frederick, therefore, again surrendered himself a prisoner in Munich. Moved by his faithful adherence to his word, Louis concluded a friendly compact with Frederick, and made preparations for their common government, 7 Sept. 1325. These preparations, however, were never carried into execution; for the agreement had been concluded without the consent of the electors. Leopold died in 1326, and Henry of Austria in 1327; Frederick also died without children, 13 Jan. 1330, after which his brothers, Albert II. and Otho, came to a reconciliation with the Emperor Louis. After the death of their uncle, Henry, margrave of Tyrol, and Duke of Carinthia (the father of Margaret Maultasch), they persuaded the emperor to grant them the investiture of Tyrol and Carinthia, in May 1335; they ceded Tyrol, however, to John, king of Bohemia, by the treaty of 9 Oct. 1356, in behalf of his son John Henry, or rather of his wife, Margaret Maultasch. In 1344, after the death of Otho and his sons, Albert II., called the Wise, united all his Austrian territories, which, by his marriage with the daughter of the last count of Pfirt, had been augmented by the estates of her father in 1324, and by the Kyburg estates in Burgundy in 1326. Of the four sons of Albert II. (Rodolph, Albert, Leopold, and Frederick), Rodolph II. (IV.) completed the church of St. Stephen's, and died in Milan in 1365, without children, a short time after his youngest brother, Frederick. In 1379 the two surviving brothers divided the kingdom, so that Albert III. (with the Queue) became master of Austria, and gave the other territories to his brother, Leopold III. the Pious. Leopold had made repeated attempts to gain the Hapsburg possessions in Switzerland. He was killed 9 July 1386, on the field of Sempach, where he lost the battle, in consequence of the valor of Winkelried, and Albert administered the government of the estates of his brother's minor sons. Margaret Maultasch ceded Tyrol to him on the death of Meinhard, her only son, who was married to the sister of Albert. She retained nothing but a few castles and 6,000 marks of gold. Her claims to Bavaria also she renounced in consideration of receiving Scharding and three Tyrolese cities, Kitzbühel, Ballenberg, and Kuffstein, and 116,000 florins of gold. In 1365 Leopold III. had bought the claims of the count of Feldkirch for 36,000 florins; for 55,000 florins Austria received Brisgau from the count of Fürstenberg, with the cities of Neuberg, Old Brisach, Kentzingen, and Billingen. The remainder of Carniola and the Windisch Mark, after the death of the last count of Görz, were purchased, together with the county of Pludentz, from the count of Werdenberg, and the possessions of the count of Hogenberg, for 66,000 florins; and the city of Trieste was acquired in 1380 by aiding in the war between Hungary and Venice. Moreover, the two governments of upper and lower Suabia were pledged for 40,000 florins by the king of Rome, Wenceslaus, to Duke Leopold. The Austrian and Styrian lines, founded by Albert III. and Leopold III., his brother, continued for 78 years. In 1395, when Albert III. died, his only son, Albert IV., was in Palestine. On his return he determined to take vengeance on Procopius, margrave of Moravia, for his hostile conduct; but he was poisoned in 1404 at Znaym. His young son and successor, Albert V., was declared of age in 1410; and being the son-in-law of the Emperor Sigismund, he united the crowns of Hungary and Bohemia in 1437, and connected them with that of Germany in 1438. But in the following year the young prince died. His posthumous son, Ladislaus, was the last of the Austrian line of Albert, and its possessions devolved on the Styrian line, 1457.

From this time the house of Austria has furnished an unbroken succession of German emperors. Hungary and Bohemia were lost for a time by the death of Albert V., and, after the unhappy contests with the Swiss, under Frederick III., the remains of the Hapsburg estates in Switzerland. But several territories were gained; and, to increase the rising splendor of the family, the emperor conferred upon the country the rank of an archduchy. The dispute which broke out between Frederick and his brothers Albert and Sigismund, relating to the divisions of their paternal inheritance, ended with the death of Albert in December 1464. In the course of the troubles which resulted from this quarrel the emperor was besieged in the citadel of Vienna by the citizens, who favored the cause of the murdered prince. Sigismund now succeeded to his portion of the estate of Ladislaus and Frederick became sole ruler of all Austria. His son Maximilian, by his marriage with Mary, the surviving daughter of Charles the Bold, united the Netherlands to the Austrian dominions. But it cost Maximilian much anxiety and toil to maintain his power in this new province, which he administered as the guardian of his son Philip. After the death of his father, 19 Aug. 1493, he was made emperor of Germany, and transferred to his son Philip the government of the Netherlands. Maximilian I. added to his paternal inheritance all Tyrol, and several other territories, particularly some belonging to Bavaria. He also acquired for his family new claims to Hungary and Bohemia. During his reign Vienna became the great metropolis of the arts and sciences in the German empire. The marriage of his son Philip to Joanna of Spain raised the house of Hapsburg to the throne of Spain and the Indies. But Philip died in 1506, 13 years before his father, and the death of Maximilian, which happened 12 Jan. 1519, was followed by the union of Spain and Austria; his grandson (the eldest son of Philip), Charles I., king of Spain (see CHARLES V.), was elected emperor of Germany. In the treaty of Worms, 28 April 1521, and of Ghent, 7 May 1540, he ceded to his brother Ferdinand all his hereditary estates in Germany, and retained for himself the kingdom of the Netherlands. The house of Austria was now the proprietor of a tract of country in Europe comprising 360,230 square miles. The Emperor Charles V. immediately increased the number of provinces in the Netherlands to 17, and confirmed their union with the German states, which had been concluded by his grandfather, under the title of the circle of Burgundy. In 1526 Austria was recognized as a European monarchy.

II. From 1526 to 1740. Ferdinand I., by his marriage with Anna, the sister of Louis II., king of Hungary, who was killed in 1526 in the battle of Mohacs, acquired the kingdoms of Hungary and Bohemia, with Moravia, Silesia, and Lusatia, the appendages of Bohemia. Bohemia rejoiced to hail Ferdinand its king. Notwithstanding the divided opinions of the nobles, and the rising fortune of his adversary, John von Zapolya (see HUNGARY), he was raised to the throne of Hungary, 26 Nov. 1526, by the Hungarian Diet, and was crowned 5 Nov. 1527. But Zapolya resorted for assistance to the Sultan, Soliman II., who appeared in 1529 at the gates of Vienna. The capital was rescued from ruin solely by the count of Salm, general of the Austrian army, and the imperial forces compelled Soliman to retreat. In 1535 a treaty was made by which John von Zapolya was allowed to retain the royal title and half of Hungary, and his posterity were to be entitled to nothing but Transylvania. But after the death of John new disputes arose, in which Soliman was again involved, and Ferdinand maintained the possession of lower Hungary only by paying the war-like Sultan the sum of 30,000 ducats annually. This took place in 1562. Ferdinand was equally unsuccessful in the duchy of Würtemberg. This province had been taken from the restless Duke Ulrich by the Suabian confederacy, and sold to the Emperor Charles V.; and when his estates were divided it fell to Ferdinand. Philip, landgrave of Hesse, the friend of Duke Ulrich, took advantage of the opportunity offered him by the embarrassment of Ferdinand in the Hungarian war. With the aid of France he conquered Würtemberg; but France ceded it again to Ulrich in the treaty of Caden, in Bohemia, concluded 29 June 1534, on condition that the province should still be a fief of Austria, and after the extinction of the male line of the Duke that it should revert to that country. Ferdinand received also the imperial crown in 1556, when his brother Charles laid by the sceptre for a cowl. He died 25 July 1564, with the fame of an able prince, leaving 3 sons and 10 daughters. According to the directions given in his will, the three brothers divided the patrimony, so that Maximilian II., the eldest son, who succeeded his father as emperor, obtained Austria, Hungary, and Bohemia; Ferdinand, the second son, received Tyrol and Hither Austria; and Charles, the third, became master of Styria, Carinthia, Carniola, and Görz. But in 1595, after the death of the Archduke Ferdinand, the husband of Philippine Welser, the fair maid of Augsburg, his sons Andrew (cardinal and bishop of Constance and Brixen, and governor of the Netherlands for Spain) and Charles (margrave of Burgau) were declared incompetent to succeed their father, and his possession reverted to his relations. In Hungary the Emperor Maximilian met with far better fortune than his father had done. The death of Soliman at Szigeth in 1566 was followed by a peace, and in 1572 Maximilian crowned his eldest son, Rodolph, king of Hungary; he was afterward crowned king of Bohemia, and was elected king of Rome. In his attempts to add the Polish crown to his Austrian dominions he was equally unsuccessful with his fourth son, Maximilian, who engaged in a similar enterprise after the decease of Stephen Bathori in 1587. Maximilian died 12 Oct. 1576, and Rodolph the eldest of his five sons, succeeded to the imperial throne. The most remarkable events by which his reign is distinguished are the war against Turkey and Transylvania, the persecutions of the Protestants, who were all driven from his dominions, and the circumstances which obliged him to cede Hungary in 1608, and Bohemia and his hereditary estates in Austria in 1611, to his brother Matthias. From this time we may date the successful exertions of the Austrian sovereigns to put down the restless spirit of the nation, and to keep the people in a state of abject submission. Matthias, who succeeded Maximilian on the imperial throne, concluded a peace for 20 years with the Turks; but he was disturbed by the Bohemians, who took up arms in defense of their religious rights. Matthias died 20 March 1619, before the negotiations for a compromise were completed. The Bohemians refused to acknowledge his successor, Ferdinand II., and chose Frederick V., the head of the Protestant League, and elector of the palatinate, for their king. After the battle of Prague, 1620, Bohemia submitted to the authority of Ferdinand. He immediately applied himself to eradicate Protestantism out of Bohemia proper and Moravia. At the same time he deprived Bohemia of the right of choosing her king, and of her other privileges. He erected a Catholic court of reform, and thus led to the emigration of thousands of the inhabitants. This large exodus of inhabitants did much to retard the growth of Bohemia. In fact the religious wars waged upon Bohemian soil for so long a time, dating back to the first outbreaks of the Hussites, with the subsequent agitations and conflicts consequent upon the Reformation, long and seriously hampered that state's general development up to modern times. The Austrian states also favoring, in general, the Protestant religion, were compelled by Ferdinand to swear allegiance to him, and Lutheranism was strictly forbidden in all the Austrian dominions. The province of Hungary, which revolted under Bethlem Gabor, prince of Transylvania, was, after a long struggle, subdued. This religious war dispeopled, impoverished, and paralyzed the energies of the most fertile provinces of the house of Austria. During the reign of Ferdinand III., the successor of Ferdinand II. (1637–57), Austria was continually the theatre of war.

In the midst of these troubles Ferdinand ceded Lusatia to Saxony at the peace of Prague, concluded in 1635; and when the war was ended he ceded Alsace to France, at the peace of Westphalia in 1648. The Emperor Leopold I., son and successor of Ferdinand III., was victorious through the talents of his minister Eugene, in two wars with Turkey; and Vienna was delivered by John Sobieski and the Germans from the attacks of Kara Mustapha in 1683. In 1687 he changed Hungary into a hereditary kingdom, and joined to it the territory of Transylvania, which had been governed by distinct princes. Moreover, by the peace of Carlovitz, concluded in 1699, he restored to Hungary the country lying between the Danube and the Theiss. It was now the chief aim of Leopold to secure to Charles, his second son, the inheritance of the Spanish monarchy, ther-

in the hands of Charles II., king of Spain, who had no children; but his own indecision, and the policy of France, induced Charles II. to appoint the grandson of Louis XIV. his successor. Thus began the war of the Spanish Succession (see Succession Wars) in 1701. Leopold died 5 May 1705, before it was terminated. Emperor Joseph I., his successor and eldest son, continued the war, but died without children, 17 April 1711. His brother Charles, the destined king of Spain, immediately hastened from Barcelona to his hereditary states, to take upon him the administration of the government. He was elected emperor 24 December of the same year; but was obliged to accede to the peace of Utrecht, concluded by his allies at Rastadt and Baden in 1714. By this treaty Austria received the Netherlands, Milan, Mantua, Naples, and Sardinia. In 1720 Sicily was given to Austria in exchange for Sardinia. The duchy of Mantua, occupied by Joseph in 1708, was now made an Austrian fief, because it had formed an alliance with France prejudicial to the interests of Germany. This monarchy now embraced 191,621 square miles. Its annual income was between 13,000,000 and 14,000,000 florins, and its army consisted of 130,000 men; but its power was weakened by new wars with Spain and France. In the peace concluded at Vienna 1735 and 1738, Charles VI. was forced to cede Naples and Sicily to Don Carlos, the Infante of Spain, and to the king of Sardinia a part of Milan, for which he received only a part of Parma and Piacenza. In the next year, by the peace of Belgrade, he lost nearly all the fruits of Eugene's victories, even the province of Temeswar; for he was obliged to transfer to the Porte, Belgrade, Servia, and all the possessions of Austria in Walachia and Bosnia. All this Charles VI. willingly acceded to, in order to secure the succession to his daughter, Maria Theresa, by the Pragmatic Sanction. This law of inheritance was passed 1713–19, and acknowledged one after another by all the European powers.

Austria under the House of Hapsburg-Lorraine.— By the death of Charles VI., 20 Oct. 1740, the male line of the Austrian house of Hapsburg became extinct; and Maria Theresa having married Stephen, Duke of Lorraine, ascended the Austrian throne. On every side her claims were disputed, and rival claims set up. A violent war began in which she had no protector but England. Frederick II. of Prussia subdued Silesia; the elector of Bavaria was crowned in Lintz and Prague, and in 1742 chosen emperor under the name of Charles VII. Hungary alone supported the queen. But in the peace of Breslau, concluded 4 June 1742, she was obliged to cede to Prussia, Silesia, and Glatz, with the exception of Teschen, Jagerndorf, and Troppau. Frederick II., by assisting the party of Charles VII., soon renewed the war. But Charles died 20 Jan. 1745, and the husband of Theresa was crowned emperor of Germany under the title of Francis I. A second treaty of peace, concluded 25 Dec. 1745, confirmed to Frederick the possession of Silesia. By the peace of Aix-la-Chapelle, 18 Oct. 1748, Austria was obliged to cede the duchies of Parma, Piacenza, and Guastalla to Philip, Infante of Spain, and several districts of Milan to Sardinia. The Austrian monarchy was now firmly established; and it was the first wish of Maria Theresa to recover Silesia. With this object in view she formed an alliance with France, Russia, Saxony, and Sweden. This was the origin of the Seven Years' war; but, by the peace of Hubertsberg, 1763, Prussia retained Silesia, and Austria had sacrificed her blood and treasure in vain. The first paper money was now issued in Austria, called state obligations, and the Emperor Francis erected a bank to exchange them. After his death, 18 Aug. 1765, Joseph II., his eldest son, was appointed colleague with his mother in the government of his hereditary states, and elected emperor of Germany. To prevent the extinction of the male line of her family Maria Theresa now established two collateral lines; the house of Tuscany, in her second son, Peter Leopold; and the house of Este, in the person of the Archduke Ferdinand. For these separations Maria Theresa indemnified the country by the confiscation of several cities, formerly pledged to Poland by Hungary, without paying the sum for which they stood pledged; by obtaining Galicia and Lodomeria in the first profligate division of the kingdom of Poland in 1772; and by the capture of Bukowina, which was ceded by the Porte in 1777. In the peace of Teschen, 13 May 1779, Austria received Innviertel, and the vacant county of Hohenembs in Suabia, the county of Falkenstein, and the Suabian territories of Tettnang and Argen; and thus at the death of the empress, 28 Nov. 1780, Austria contained 234,684 square miles; it had lost 16,366 square miles, and gained 34,301. The population was estimated at 24,000,000; but the public debt also had increased to 160,000,000 florins. The administration of the empress was distinguished by substantial improvements in connection with government, agriculture, trade, and commerce, the education of the people, the promotion of the arts and sciences, and of religion. The foreign relations of the kingdom also, even those with the Roman court, were happily conducted by the talents of her minister, Kaunitz.

Her successor, Joseph II., was active and restless; impartial, but too often rash and violent. While a colleague with his mother in the government he diminished the expenses of the state, and introduced a new system in the payment of pensions and of officers. But after the death of his mother all his activity and talent as a sovereign was fully developed. As severe to the military as to the civil officers, he adhered, however, to liberal principles. The censorship of the press was reformed; the Protestants received full toleration, and the rights of citizens; the Jews were treated with kindness; 900 convents and religious establishments were abolished, and even the visit of Pius VI. made no alteration in Joseph's system of reformation. The system of education he subjected to revision and improvement; and he tried to foster manufactures by duties on foreign goods. But his zeal excited the opposition of the enemies of improvement. The low countries revolted, and his vexation probably led him to attempt the exchange of the Netherlands, under the title of the kingdom of Austrasia, for the palatinate of Bavaria under an elector. But the project was frustrated by the constancy and firmness of the next agnate, the Duke of Deux-Ponts, and by the German league concluded by

Frederick II. Joseph was equally unsuccessful in the war of 1788 against the Porte. His exertions in the field destroyed his health; and grief at the rebellious disposition of his hereditary states accelerated his death, which happened 20 Feb. 1790. Joseph II. was succeeded by his eldest brother, Leopold II. By his moderation and firmness he quelled the turbulent spirit of the Netherlands, and restored tranquillity to Hungary. The treaty of Reichenbach with Prussia, 27 July 1790, and the treaty of Sistova, 4 Aug. 1791, led to a peace with the Porte. The unhappy fate of his sister and her husband, Louis XVI. of France, induced him to form an alliance with Prussia, but he died 1 March 1792, before the revolutionary war broke out. Soon after the accession of his son, Francis II., to the throne, and before he was elected German emperor, France declared war against him as king of Hungary and Bohemia. In the first articles of peace, dated at Campo Formio, 17 Oct 1797, Austria lost Lombardy and the Netherlands, and received, as a compensation, the largest part of the Venetian territory; two years previous, in 1795, in the third division of Poland, the Austrian dominions had been enlarged by the addition of west Galicia. In the beginning of the year 1799, the Emperor Francis, in alliance with Russia, renewed the war with France. But Napoleon extorted the peace of Lunéville, 9 Feb. 1801, and Francis acceded to it, without the consent of England. By the conditions of the treaty he was to cede the county of Falkenstein and the Frickthal. Ferdinand, Grand Duke of Tuscany, at the same time renounced his claim to this province and received, in return for it, Salzburg and Berchtesgaden, with a part of the territory of Passau, and was afterward made master of the largest part of Eichstädt, and honored with the title of elector. Austria obtained the Tyrolese archbishoprics, Trent and Brixen, and, notwithstanding its cessions of territory to France, had gained, including its acquisitions in Poland, 9,580 square miles; this made the whole extent 253,770 square miles. The public debt had also increased to 1,220,000,000 florins.

The first consul of France now caused himself to be proclaimed emperor; and 11 Aug. 1804, Francis declared himself hereditary emperor of Austria, and united the Austrian states under the name of the empire of Austria. Immediately after this important act he took arms once more with his allies, Russia and Great Britain, against the government of France. The war of 1805 was terminated by the peace of Presburg, (26 Dec. 1805). By the conditions of the treaty Francis was obliged to cede to France the remaining provinces of Italy; to the king of Bavaria, Burgau, Eichstädt, a part of Passau, all Tyrol, Vorarlberg, Hohenembs, Rothenfels, Tettnang, Argen, and Lindau; to the king of Würtemberg the five towns lying on the Danube, the county of Hohenberg, the landgraviate of Nellenburg, Altdorf, and a part of Brisgau; and to the Grand Duke of Baden the remainder of Brisgau, Ortenau, Constance, and the commandery of Meinau. He received, in return, Salzburg and Berchtesgaden; the elector of Salzburg was compensated by the province of Würzburg; and the dignity of grand master of the Teutonic order was made hereditary in the house of Austria. Thus ended a war which cost the Austrian monarchy, besides the territories just enumerated, 90,000,000 florins, which were carried away by the French from Vienna, and 800,000,000 for the other expenses of the war; of which Francis paid a large proportion from his private purse. After the formation of the Confederation of the Rhine (12 July 1806) Francis was forced to resign his dignity as emperor of Germany (6 Aug. 1806), which had been in his family more than 500 years. The old German, or Holy Roman, empire thus came to an end, and Francis had now only the title of Francis I., emperor of Austria. In 1809 he resolved on a new war with France, aided only by Great Britain, which did nothing more than furnish some pecuniary assistance and made a useless attack on Walcheren. Austria fought courageously, but in vain. The peace of Vienna (14 Oct. 1809) cost the monarchy 42,380 square miles of territory, 3,500,000 subjects, and more than 11,000,000 florins of revenue. The public debt was also increased to 1,200,000,000 florins, and all the paper money in circulation was estimated at 950,000,000.

Napoleon, after tearing from the Austrian monarchy its fairest provinces — the duchy of Salzburg, with Berchtesgaden, Innviertel, western Hausruckviertel, Carniola, and Görz, Trieste, the circle of Villach, a large part of Croatia, Istria, a part of the Grisons, the Bohemian territories in Saxony, all west Galicia, the circle of Zamoski in east Galicia, Cracow, with half the salt works of Wieliczka, the circle of Tarnopol, and many other territories which were given to Russia — formed a personal connection with the ancient family of Hapsburg, by his marriage with Maria Louisa, daughter of the emperor of Austria, and (14 March 1812) concluded an alliance with the emperor Francis against Russia. But the emperor of France was repulsed on his invasion of this country; Prussia rose up against him; and after the Congress of Prague had separated without accomplishing anything, Francis, 12 Aug. 1813, declared war against France, and formed an alliance, 9 Sept. 1813, at Teplitz, with Great Britain, Russia, Prussia, and Sweden, against his son-in-law. In the battle of Leipsic, the Austrian troops took an honorable part. The firmness with which the emperor signed the act of proscription against his son-in-law, and fixed the fate of his daughter and her infant, excited general respect. He signed the same act against Napoleon a second time, when he returned from Elba. He also opposed Murat in Italy. Yet the Austrian cabinet endeavored to provide for young Napoleon in the settlement of the affairs of France. By the Congress of Vienna, 1814–15, Austria gained the portion of Italy which is usually known as Lombardy and Venetia, and recovered, together with Dalmatia, the hereditary territories which it had been obliged to cede. The former Grand Duke of Würzburg, on the contrary, ceded his territory to Bavaria, and again took possession of Tuscany. The final act resulting from the congress was signed in 1820. In 1821 liberal movements in Italy were put down. The July revolution of 1830, in France, cause warlike preparations to be made; but after Great Britain had acknowledged the new government Austria acknowledged it also. Insurrections which took place in Modena, Parma, and the Papal states, 1831–2, were

suppressed without much difficulty. In the London conference relative to the affairs of Belgium Austria took an active share; but in proportion as Great Britain and France became more closely united, Austria entered into more intimate relations with Russia and Prussia. In the Polish insurrection Austria ultimately gave indications of a strong leaning in favor of Russia. The death of the Emperor Francis I., 2 March 1835, and the accession of Ferdinand I. made little change in the Austrian system of government. Metternich still continued at the head of affairs and to foster the reactionary policy. In 1846 the failure of the Polish insurrection had led to the incorporation of Cracow with Austria, but discontent with the government very widely prevailed in the empire. In Italy, the declarations of Pio Nono in favor of reform, and the concessions into which most of the other governments of the Italian peninsula had been hurried, increased the difficulties of Austria. In Hungary the constitutional opposition became stronger and stronger, and latterly, under the guidance of Kossuth and other popular agitators, assumed the form of a great constitutional movement. In 1848 the expulsion of Louis Philippe shook all Europe to its foundations. Metternich found it impossible any longer to guide the ship of state, and the government found itself compelled to grant a free press, and allow the citizens freely to arm themselves. The popular movement made great progress in Hungary; and in Italy a formidable insurrection broke out, threatening the very existence of the Austrian power in the peninsula. In the very centre of the empire, in Vienna itself, the insurrection made equal progress, and the royal family, no longer in safety, removed to Innsbruck. The Austrian monarchy appeared now to be hanging by a thread. The Hungarian diet declared itself permanent, under the presidency of Kossuth. Various ministerial changes took place, and at last the emperor abdicated in favor of his nephew, Francis Joseph. More vigorous measures were now adopted, and Austria, strongly aided by the forces of Russia, succeeded in suppressing the Hungarian insurrection. Haynau, on the occasion, rendered himself notorious by his severity, and Hungary underwent the fate of a conquered country. The year 1855 is memorable in Austrian history for the conclusion of a concordat with the Pope which put the educational and ecclesiastical affairs of the empire entirely into the hands of the papal see. It established an ecclesiastical censorship of the press, and placed all schools, even private schools, under the surveillance of the bishops; it proclaimed the complete independence of the bishops in relation to the civil government, so that all decrees proceeding from Rome might be published without obtaining the royal *placet*, and it authorized the bishops to convoke the provincial councils and diocesan synods without the consent of the civil authority. In 1859 the hostile intentions of France and Sardinia against the possessions of Austria in Italy became so evident that she declared war by sending an army across the Ticino, but after disastrous defeats at Magenta and Solferino she was compelled to cede Milan and the northwest portion of Lombardy to the Sardinian king. In 1864 she joined with Prussia and the other German states in the spoliation of Denmark, but a dispute about the conquered provinces of Schleswig-Holstein involved her in a war with her allies (1866), while at the same time Italy renewed her attempts for the recovery of Venice. Austria had accordingly to show front both in the north and in the south. The southern army under Archduke Albert fought successfully, defeating the Italians under Victor Emanuel at Custozza, 24 June, and driving them back across the Mincio, but the fortune of the northern army under Gen. Benedek was very different. On 3 July Benedek was completely defeated by the Prussian forcesat Königgrätz (Sadowa) in Bohemia, and the road to Vienna lay open to the victors. Francis Joseph now ceded Venetia to Napoleon III., and claimed his intervention to assist in procuring a peace, evidently wishing to make a separate treaty with Italy, so as to be at liberty to employ the southern army against Prussia. This design did not succeed, however. Both Italy and Prussia were willing to accept the mediation of Napoleon, but Italy would not hear of a separate arrangement, and continued the war. On 20 July Admiral Tegetthoff defeated the Italian fleet near the Dalmatian island Lissa; but, on the other hand, the Prussians continued to advance into Austria, and threatened Vienna. Francis Joseph accordingly saw himself obliged to conclude a peace with Prussia 23 August, and a little later peace was concluded with Italy also, 3 October. The result of the war was the cession of Venetia through France to Italy, and the withdrawal of Austria from all interference in the affairs of Germany. (See Seven Weeks' War.)

Since 1866 Austria has been occupied chiefly with the internal affairs of the empire. The first aim of the government was to restore the constitution of the state, which had been established in February 1861, but which had been suspended since 1865 owing to the demand of Hungary for self-government. As Austrian statesmen were anxious for a settlement of the dispute, the Hungarian demands were finally agreed to, and the empire of Austria divided into two parts, the one made up of the Cisleithan or Slavonic-German provinces, the other of the Transleithan provinces, the latter forming together the kingdom of Hungary. These two divisions of the empire were to be entirely independent, except in matters of diplomacy and military and naval matters — to some extent also in matters of finance. This settlement was consummated by the coronation of the Emperor Francis Joseph I. as king of Hungary, which took place at Pesth-Ofen, on 8 June 1867. During the session of the Reichsrath, that is, the diet of the Cisleithan provinces, held in the same year, the important question of the concordat of 1855 came up for discussion. The Liberal majority in the diet were desirous of seeing it entirely repealed, but as they fully recognized the insuperable obstacles in the way of this step, they were content to proceed by separate enactments intended to weaken the power that had been gained to the papal see by the concordat. With this end in view three measures were brought forward, one for the re-establishment of civil marriage, one for the emancipation of the schools from the domination of the Church, and one for the placing of the different creeds on a footing of equality. Before 25 May 1868, all these measures had passed through both houses of the diet, and on

that day they received the imperial sanction. These laws were declared by the Pope to be "abominable," as well as null and void. Further enactments having in view the weakening of the power of the papal see in the state were passed in 1874, and were condemned by the Pope in the severest terms. The fact of the Austro-Hungarian dominions comprising so many different nationalities with different languages has always given the government much trouble, both in the management of internal affairs and in regard to external matters. In the recent revival of the Eastern question, for instance, the course of Austria was hampered by the sympathy shown by the Magyars for the Turks, while her Slav subjects were naturally more favorable to Russia. Previous to the outbreak of hostilities between Russia and Turkey she joined with the other powers in remonstrance with Turkey, but as to the actual struggle remained neutral. At the close of the war in the middle of 1878 Austria took part in the Congress of Berlin, where the settlement of the Eastern question was arranged, and by this congress it was decided that the provinces of Bosnia and Herzegovina should in future be administered by Austria-Hungary instead of Turkey. Since then the external history of the monarchy has been uneventful, but there has been considerable friction at home between the different nationalities and political parties.

Area and Divisions.— The Austrian empire extends from about lat. 42° to 51° N., and from lon. 8° 30′ to 26° 30′ E.; the total area in round numbers is 240,000 square miles. Its greatest length from east to west is about 860 miles; its greatest breadth about 400 miles. It is bounded south by Turkey, the Adriatic Sea, and the kingdom of Italy; west by Switzerland, Bavaria, and Saxony; north by Prussia and Russian Poland; and east by Russia and Rumania. On the shores of the Adriatic, along the coasts of Dalmatia, Croatia, Istria, etc., lies its only sea frontage, which, compared to the size of the monarchy, is of insignificant extent. Besides being divided into the two great divisions above mentioned, the Austro-Hungarian monarchy is further divided into a number of governments or provinces. The following table exhibits the name and area of these governments, with their population in 1890 and 1900:

Natural Features.— Although presenting every variety of surface the prevailing character of the Austrian dominions is mountainous, there being few districts where mountains are not found; while the plains do not occupy more than a fifth part of the whole superficies. The loftiest ranges, and the most extensively ramified, are found in Tyrol, Styria, Illyria, and the southern parts of Austria proper. In some of these regions the scenery is bold and romantic, and has been considered equal to that of Switzerland. The most extensive tracts of low or flat land occur in Slavonia and the southeast and central parts of Hungary; much of this level land is remarkably fertile, but it is met at various points by vast morasses and arid steppes. The principal valleys are found in Tyrol, Salzburg, Styria, and Illyria. Extensive plains stretch along the courses of the rivers, particularly the Danube, the Theiss, and the March. The principal rivers of Austria are the Danube, the Elbe, the Save, the Drave, the Waag, the March, the Inn, the Teiss or Theiss, and the Maros. The Danube for upward of 800 miles is navigable for quite large vessels throughout the whole Austrian territory; while all the others, most of them tributaries of the Danube, are navigable for vessels of smaller size. All the rivers abound in fish. The lakes are numerous and often picturesque, although those in the lowlands, particularly in the plains of Hungary, are rather marshes than lakes. Austria lies between the isotherms of 60° and 50°, and has a climate nearly as various as its surface. The northern regions, between the 49th and 51st degrees of north latitude, have an average temperature resembling that of the north of France. Between lat. 46° and 49° the heat is considerable; and between 42° and 46°, which comprises the whole of South Austria, it is still greater; the winter lasting two or three months only, and being, in general, extremely mild. The principal products of the north are wheat, barley, oats, and rye; in the centre, vines and maize are added; and in the south, olives. The productive capabilities of the soil, however, are not rendered available to their full extent. The wines of Austria are inferior on the whole, with exception of a few choice kinds, including the well-known Tokay. A great portion of the

Divisions.	Area in sq. m.	Population, Dec. 31, 1890.	Population, Dec. 31, 1900.

worst wine is made into brandy. The average produce of wine is about 540,000 gallons, of which Hungary yields by far the largest proportion. The forests cover 69,000 square miles, or one third of the productive soil of the empire, and yield timber of excellent quality, adapted for all purposes. Wild deer, wild swine, chamois, foxes, lynxes, and a species of small black bear, are found in many districts, the fox and lynx being particularly abundant. Herds of a native breed of horses, of small size, roam wild over the plains of Hungary. All the domestic animals of England are known throughout the empire. A large portion of the countries now composing the Austrian empire was at one time submerged by the sea, particularly Hungary, where the general appearance of its vast plains, the nature of their soil, and, above all, the occurrence of fossil sea shells, leave no room to doubt the former dominion of the ocean. Throughout all Austria the Tertiary formation prevails, with a margin of the Secondary formation, stretching to a greater or lesser extent into the surrounding countries, and diversified by patches of igneous rocks of the Tertiary and Alluvial epochs. In mineral productions Austria is very rich, possessing, with the exception of platinum, all the metals. We may more particularly mention gold, silver, iron, copper, lead, zinc, quicksilver, coal, and salt. The total annual value of the mineral products of the Austrian empire is estimated at upward of £12,000,000; of which £2,300,000 represents coal; £2,000,000 lignite; £4,300,000 smelted ores; and £3,400,000, salt.

Manufactures and Commerce.—Manufactures are in the most flourishing condition in Bohemia, Moravia, Silesia, and Lower Austria; less so in the eastern provinces, and insignificant in Dalmatia, Bukowina, and the military frontiers. The total money value of manufactured products amounts to at least £130,000,000, the value of agricultural products to more than £200,000,000. As regards the individual branches of manufacture, there are machines produced yearly to the value of £4,000,000 to £5,000,000, and the supply about equals the demand. In the manufacture of musical and scientific instruments Austria holds a high position; those of Vienna are especially celebrated. The manufacture of stoneware and chinaware is very extensive, being valued at about £2,500,000 yearly, and giving rise to a brisk export trade. The glass manufacture is one of the oldest and most highly developed branches of industry in Austria. The manufactories, about 200 in number, are spread over the whole of the monarchy, but are most numerous in Bohemia, where glass and glasswares of every kind are produced. The yearly value of this class of manufactures is estimated at about £2,500,000, of which a very considerable quantity is exported. The manufacture of metal goods is carried on to a great extent, being valued at about £10,000,000; and some of the iron and steel goods, such as scythes and reaping hooks, have a world-wide reputation. The manufacture of gold and silver plate and jewelry is also important, and the articles of Vienna workmanship compete successfully with the French. The production of chemicals reaches the amount of £5,000,000, and about covers the home demand. As regards articles of food, the sugar from beets has an annual value of about £12,000,000; of beer the production is £4,000,000 in value, the number of breweries is over 2,000; spirits are distilled to the value of £3,500,000. The manufacture of tobacco is a state monopoly, and is carried on in 38, mostly large, establishments. Of textile industries, the silk manufacture, since the loss of the Lombardo-Venetian provinces, has become greatly limited. The manufactures of woolen, hemp, and flax are among the oldest and most important of the state. The first gives employment to about 400,000 persons, and turns out about £14,000,000 worth of goods yearly, of which a considerable proportion is annually exported. In the whole monarchy there are about 650,000 spindles and 65,000 looms employed in woolen weaving. The linen manufacture (including also hemp and jute) gives employment to a greater number of persons than any other branch of industry (many of them in their homes), and produces goods to a greater value. The chief seats of the manufacture are Bohemia, Moravia, and Silesia. The annual produce of the cotton manufacture is next in value to that of woolens. Although about 2,400,000 spindles are in activity, cotton yarn has to be imported. On the other hand, however, excellent cotton cloths are exported. Tanning is carried on to the greatest extent in Moravia, Lower Austria, and Bohemia, yet not sufficiently to supply the demand. The manufacture of leather goods, however, is very large, and in the production of gloves (in Vienna and Prague) Austria stands next to France. Altogether the manufacture of leather and leather goods employs about 200,000 persons and produces goods to about £10,000,000 yearly.

In addition to the general import and export trade, Austria carries on,—partly from its central position in the contient of Europe, and partly from its numerous navigable streams, excellent roads, and in later times its partially completed railway system,—a very considerable amount of business in the transit of goods through her territory to other countries. In 1887 the total value of the imports into Austria-Hungary was, in round numbers, £53,900,000, while the value of the exports was £69,860,000; the respective figures for the year 1897 were £62,940,000 and £63,854,000. These values were exclusive of coin and bullion, the import of which into Austria-Hungary in 1897 amounted to £8,322,000, while the export for the same year was £4,304,000. The principal import is raw cotton, which was imported in 1897 to the value of £4,225,000; wool being imported to the value of £3,209,000; cotton and woolen yarn to the value of £2,433,000; silk and silk goods to the value of £2,725,000; coffee to the value of £2,192,000; tobacco leaf and manufactured to the value of £2,167,000; coal and coke to the value of £3,100,000. Among the other chief articles furs and hides were imported to the value of £1,842,000; leather was imported to the value of £1,783,000; machinery, locomotives, etc., to the value of £1,642,000; hardware and clocks to the value of nearly £1,000,000; books, newspapers, and maps to the value of £1,492,000; grain to the value of £3,400,000; cattle to the value of £1,300,000. Wood formed the chief article of export, the value of this product being in 1897 £7,000,000; next came sugar, value £5,120,000; cattle to the value of £3,800,000. Among other exports of importance were grain to the value of £3,475,000; leather and leather

wares (including gloves), £2,242,000; hardware, £1,533,000; eggs, £3,660,000; coal and coke, £2,850,000; woolen manufactures, £1,542,000; glass and glassware, £1,867,000; paper and paperwares, £909,000; wool, £883,000; malt, £2,042,000; wooden goods, £1,600,000; hides, etc., £1,420,000. Nearly one half of the commerce of Austria is carried on with Germany, the next places being occupied by Great Britain, Italy, Russia, and the United States. Including fishing vessels and small craft, Austria-Hungary, in the beginning of 1897, had 12,447 vessels of all sizes, with a tonnage of 270,250, and employing 34,431 men. Of these 227 of 212,069 tons were sea-going vessels, the coasting vessels being 1,739 in number with a tonnage of 35,515. The principal ports of the empire are Trieste, Pola, and Fiume. In 1898 there were 20,445 miles of railway open for traffic in the empire, of which 10,598 were in Austria, and 9,847 in Hungary.

Money, Weights, and Measures.— On 1 Jan. 1900 a new monetary system went into effect, the coinage being changed from a silver to a gold basis, and the standard coin and money of account being the crown (equal to 20.3 cents in United States gold). Practically the chief medium of exchange is banknotes, of various denominations. The Austrian centner, the weight by which all large quantities are rated, is 123½ pounds avoirdupois. The metze (pl., metzen), the largest dry measure = 1.7 of a bushel, or somewhat less than the fourth part of an English imperial quarter, nine metzen making two quarters nearly. The eimer, the most generally used liquid measure, is equal to 14.94 English wine gallons. The Vienna foot is equal to 12.45 inches English. The joch of land is 1.43 English acre.

Population.— None of the European states, with the exception of Russia, exhibits such a diversity of race and language among their population as does the Austrian empire. The Slavs, who amount to above 19,000,000, or 45 per cent of the total population, are the chief of the component nationalities of the monarchy in point of numbers, forming the great mass of the population of Bohemia, Moravia, Carniola, Galicia, Dalmatia, the kingdom of Croatia and Slavonia, and Northern Hungary, and half the population of Silesia and Bukowina. This preponderance, however, is only apparent, as none of the other races are split up into so many branches differing so greatly from each other in language, religion, civilization, manners, and customs. These branches are the North Slavic Czechs, Moravians, and Slovaks, the Ruthenians and Poles, and the South Slavic Slovenians, Croats, Serbs, and Bulgarians. The Germans, about 10,570,000 in number, are scattered over the whole monarchy and form almost the sole population of the archduchy of Austria, Salzburg, the greatest portion of Styria and Carinthia, almost the whole of Tyrol and Vorarlberg, considerable portions of Bohemia and Moravia, the whole of the west of Silesia, etc.; and they are also numerous in Hungary and Transylvania. The Magyars or Hungarians (7,440,000 in number, or about 16 per cent of the total population) form the great bulk of the inhabitants of the kingdom of Hungary and of the eastern portion of Transylvania. To the Italic or Western Romanic stock belong the inhabitants of South Tyrol and parts of the coast lands and Dalmatia, numbering about 700,000 in all. A considerable portion of the southeast of the empire is occupied by members of the Rumanian (or Eastern Romanic) stock, who number altogether about 2,800,000, and form more than half the population of Transylvania, besides being spread over the southeastern parts of Hungary, Bukowina, and part of Croatia and Slavonia. The number of Jews is also very considerable (above 1,000,000), especially in Galicia, Hungary, Bohemia, and Moravia. There are also several other races whose numbers are small, such as the Gypsies (95,000), who are most numerous in Hungary and Transylvania, and the Albanians in Dalmatia and neighboring regions. The population is thickest in Lower Austria, Bohemia, Silesia, and Moravia; thinnest in Salzburg. Generally speaking, it decreases in density from west to east.

Religion.—The state religion of Austria is the Roman Catholic, and next in numbers is the Greek Church. Calvinism and Lutheranism are also professed by a large body of the people; the former mostly in Hungary and Transylvania, the latter in the German provinces and in Galicia. The civil power exercises supreme control in all ecclesiastical matters, the emperor being, in everything but name, head of the Church; and as no sentence of excommunication, or other ecclesiastical edict, can be issued without the sanction of the Crown, the Pope's direct authority in Austria is somewhat limited. In 1890 there were in the Austrian portion of the monarchy 18,784,063 Roman Catholics, 2,797,089 Greek Catholics united to the Roman Church, 540,715 non-united, 430,849 Protestants, and 1,135,118 Jews. In Hungary and Transylvania there were 8,823,105 Roman Catholics, 1,670,283 Greek united and 2,633,491 non-united, 3,427,896 Protestants, and 724,588 Jews.

Education.— The intellectual culture of the people is at very different stages of advancement among the different races. It is highest in the German provinces and lowest in the east. In Upper and Lower Austria, Salzburg, Tyrol, Moravia, Silesia, and Bohemia, almost all the children of suitable age are in attendance on the public schools; while in Bukowina only about 34, and in Galicia about 59 per cent of them are at the schools. The educational system has been entirely remodeled in recent times. The elementary schools, or those in which the common branches are taught, are designated national schools or schools for the people (*Volksschulen*), and there children have to attend from the end of their 6th to the end of their 14th (in some provinces only their 12th) year. A higher class of elementary schools are known as town schools (*Bürgerschulen*), in which a superior education may be obtained. For the training of instructors for the people's schools, there are 43 normal schools for male teachers and 26 for female. As secondary schools or institutions of a more advanced grade, there are the gymnasia and the "real-schools," as they are called. The gymnasia resemble the best sort of our grammar schools, being intended chiefly to prepare pupils for the universities, great attention being paid in them to the classical languages. In the real-schools a more practical end is kept in view, and modern languages and physical science form the groundwork of the educational course. A complete course in a gymnasium extends over four years, in a real-school either three or four. There

are also schools of an intermediate stamp known as "real-gymnasia." The higher education is provided for by the universities, the polytechnic institutes, and the various institutions in which particular subjects are taught. There are 11 universities in the monarchy, namely, in Vienna, Prague (two — a German and a Bohemian), Pesth, Gratz, Cracow, Lemberg, Innsbruck, Klausenburg, Agram, and Czernowitz. Most of these have four faculties — Catholic theology, law and politics, medicine, and philosophy. There are also several technical high schools in which mathematics, physics, and natural science are the chief objects of study. Besides these there are theological institutions; schools for jurisprudence and philosophy; schools of commerce, industrial arts, agriculture, arboriculture, and mining; military schools, naval schools, art schools, conservatories of music, etc. The principal libraries are the royal library at Vienna, with 450,000 volumes, 24,000 manuscripts, and 7,000 incunabula; and the university libraries of Vienna and Prague.

Constitution, Revenue.— As already mentioned, the Austrian dominions now consist of a German, or Slavo-Germanic, or Cisleithan empire, and a Transleithan or Hungarian kingdom, each with its own parliament, ministers, and government. The same hereditary sovereign rules over both, and they have a common army and navy, and a sort of common parliament known as the Delegations. The Delegations consist of 120 members, one half of whom are chosen by and represent the legislature of German Austria, and the other half that of Hungary, the upper house of each legislature returning 20 and the lower house 40 deputies. In all matters affecting the common affairs of the monarchy the Delegations have a decisive vote, and their resolutions do not require the confirmation of the representative assemblies in which they have their source. The Delegations meet alternately in Vienna and Budapest. Their ordinary mode of procedure is to sit and vote in two chambers, the 60 deputies of Cisleithan Austria forming the one, and the 60 of Hungary the other. But if no agreement can be arrived at in this manner, the two bodies must meet together and without further debate give their final vote, which is binding for the whole empire. The jurisdiction of the Delegations extends specially to all matters affecting foreign affairs, war, and finance. The constitution of German Austria was finally established in December 1867. The provinces have each a diet or legislature of their own for provincial affairs, these diets being 16 in number, one each for Bohemia, Dalmatia, Galicia, Upper Austria, Lower Austria, Salzburg, Styria, Carinthia, Carniola, Bukowina, Moravia, Silesia, Tyrol, Vorarlberg, Görz and Gradisca, and Istria, the municipal council of Trieste having similar functions. The provincial diets are composed of the archbishops and bishops, the rectors of the universities, the representatives of the great estates, of towns, of boards of commerce, of rural communes, etc. The laws passed in these diets have reference to provincial taxation, agricultural, educational, and other matters. The national parliament or legislature of German Austria, called the *Reichsrath* (or council of the realm), consists of an upper house or house of lords (*Herrnhaus*), and a lower house or house of deputies (*Abgeordnetenhaus*). The former is composed of princes of the imperial family, of nobles whose families have a hereditary right to this dignity, of the archbishops, the bishops of princely rank, and of a certain number of life members nominated by the emperor. The lower houses consist of 353 members, elected by all citizens above 24 possessing a small property qualification. The rights belonging to the Reichsrath are: consent to all laws relating to military service; co-operation in the legislation on commercial matters, customs, railways, etc.; and examination of the estimates of the income and expenditure of the state, and other financial matters. The constitution of Hungary, including also Croatia, Slavonia, and Transylvania, dates from the foundation of the kingdom, or about 895 A.D. It rests upon a number of statutes published at long intervals, the principal of these being the *Bulla Aurea* or Golden Bull of Andrew II., granted in 1222, by which the government was defined as an aristocratic monarchy. The legislative power is vested in the king and the parliament (*Reichstag*) conjointly. The latter consists of an upper house or house of magnates, and of a lower house or house of representatives. The house of magnates consists of the archdukes of the imperial family who have attained their majority, 54 ecclesiastical dignitaries, 151 counts, and 36 barons as hereditary members, 84 life members nominated by the sovereign, or elected by the chamber, etc. The lower house (of 453 members) is composed of elected representatives. The Hungarian Reichstag corresponds to the Reichsrath of the Cisleithan provinces, and accordingly only deals with such matters as are common to the provinces belonging to the Hungarian crown. Transylvania is, so far as legislation and administration are concerned, entirely incorporated with Hungary. Croatia and Slavonia, however, have a Landtag or diet of their own, which, like the provincial diets of the Cisleithan portion of the empire, consists of only one chamber, and which is competent to deal with all matters belonging to the interior administration of the provinces, with religion and education, and with the administration of justice. Fiume, which was formerly associated with Croatia and Slavonia, and subject to the Landtag of these provinces, has, since August 1870, been put directly under the central Hungarian government.

There being three distinct parliaments in the empire, there are also three budgets, namely, that for the whole empire, that for Cisleithan, and that for Transleithan Austria. In the budget of the whole empire for 1902 the revenue and expenditure were each estimated at 365,181,966 crowns; in that for Cisleithan Austria the revenue was estimated at 1,685,966,357 crowns, and the expenditures at 1,685,117,944 crowns; and in that for Transleithan Austria the estimated revenue was 1,086,870,018 crowns, the estimated expenditure being a little less. A small portion of the imperial revenue of Austria is derived from customs and other sources, and the remainder is made up by the two divisions of the empire, 70 per cent thereof being contributed by the Cisleithan and 30 per cent by the Transleithan portion.

Recent Politics.— Austria to-day is what Metternich with less truth called Italy, little more than a geographical expression. Three bonds do indeed unite its discordant nationalities; but

for the hasty observer the country might well seem in the last stages of decomposition. There is nothing really Austrian in Austria — no Austrian interests, no Austrian language, or literature, or patriotism, no Austrian nationality, no Austrian standard of civilization; nothing except the emperor, and the army, and the cockpit of the Reichsrath that the races share in common. The Germans form a compact entity by themselves in Upper and Lower Austria and the Duchy of Salzburg. In Bohemia there is a respectable colony of them along the borders of Saxony and Bavaria, over 2,000,000 strong, but even so they are outnumbered by the Czechs in the ration of 3 to 5. All together the German-speaking subjects are about a third of the total population of Austria — some 8,500,000 out of 24,000,000. The Czechs in Bohemia, Moravia, and Silesia number roughly 5,000,000. In Galicia some 4,000,000 Poles hold down a trifle over 3,000,000 Ruthenians. A couple of million Slovenes, Servians, and Croats are scattered over Carinthia and Carniola, while nearly 1,000,000 Italians inhabit the Tyrol. None of these races can alone be said to represent Austria, though all of them claim to; and their mutual wranglings, struggles to realize themselves, struggles to elbow out their neighbors and seize an incontestable ascendency, are the background, and at times something more, of modern Austrian politics. But for the dashing tenacity of the Magyars, Hungary might be as heterogeneous as her partner in the dual monarchy. The Magyars are only 7,500,000 out of nearly 18,000,000, but they are a race with the fierce hardihood and determination of the Teutonic stock and a grace and fascination that are neither Latin nor Celtic, but distinctively their own. Since the two nations entered into a partnership agreement as coequal and sovereign states, the Magyars have devoted all their brilliant energies and the immense force of a concentrated one-idealness to making themselves paramount throughout the southern half of the realm. They revolted against being Germanized, but see no inconsistency in insisting that the Servians, Croats, Rumanians, and Slovenes shall be Magyarized; and they have set about the task with unsparing persistency just saved from relentlessness by their genius for wise compromise. A restricted suffrage, excluding nineteen twentieths of the people from the polls, keeps public affairs in their grasp. The schools have been a much more effective instrument in the development of a national feeling, and the Magyars have thoroughly worked them to that end. Like the Russians and Americans, but unlike the English, the Magyars recognize that where there is difference of speech there will be difference of sentiment, of heart, of interests, and at a pinch perhaps of loyalty, and have accordingly refused to make the preservation of dialects an object of government. Fifty years ago the Hungarian nobles spoke German and a bastard monkish Latin in their homes and diets. To-day the native tongue obtains, among all classes, and the absorption of all manner of outlanders,— German, Slovacks, Jews, Rumanians, and Croats,— by the irresistible and peaceful process of denationalization in the schoolroom, has gone on at such a pace that the Magyars increase nearly three times as quickly as any of the neighboring races. The struggle of the nationalities in Hungary has ended in a more or less resigned acquiescence in Magyar rule.

In Austria, as in Spain, the factory is placed some distance behind the barracks as an element of national welfare, and a contemptuous bureaucracy shackles trade with a hundred entangling regulations. The Magyars, on the other hand, have been as attentive to commerce as to their racial position. Perhaps there is no country in which the state, as such, has done more for industrial development. The really vital domestic problems of Hungary are, indeed, no longer racial, and as freedom of worship is the law, they have never been acutely religious. But in the rise of what is called Agrarian Socialism, there is something that may test Magyar statesmanship severely. Meanwhile the Magyars are the backbone of the dual monarchy. Against the rising tides of Pan-Slavism they present a compact and unbending front. Together with the German empire they may be considered the outposts of Europe against Slav aggression; and even in the domestic affairs of the monarchy their unbreakable unity as a political force has made their influence wellnigh decisive. The *Ausgleich* of 1867,— the partnership agreement between the two halves of the realm,— prescribed that matters of common concern, such as foreign affairs, diplomatic representation, and naval and military matters, should be arranged by 60 delegates from each country, meeting twice a year. The Austrian delegation is made up of Germans, Czechs, Poles, Ruthenians, Italians, whose feuds make steady co-operation all but impossible. The Hungarian delegation, on the other hand, is composed of 55 Magyars and 5 Croatians, working with the directness and harmony of a single man. The consequence is that in the long run the Hungarian view is fairly sure to carry the day. So far each renewal of the *Ausgleich* has brought substantial modifications in favor of Hungary, and the centre of gravity has, in fact, shifted from Vienna to Budapest. The emperor, when driven to it, might go against the German-speaking Austrians, but never against the Magyars; and the Magyars, fully realizing their power, have extorted concession after concession from their unhappy partner; have applied the screw so persistently, that it is becoming a question whether they are not as unpopular among Austrian statesmen as the very Czechs themselves. The troubles of the dual monarchy are due to the failure of the Germans to repeat in Austria the successes of the Magyars in Hungary. "You look after your hordes," said Count Beust to a Hungarian statesman when the Austrian empire became the dual monarchy, "and we'll look after ours." The Czechs of Bohemia have turned to ridicule the count's too valiant declaration. The Germans of Vienna, one must remember, are very different from the Germans of Berlin. Of all the sections of the Teutonic race they appear to have the least robustness of intellect or character and the laxest grip on practical affairs. Indolent, hypercritical, and self-satisfied, they are the emasculated editions of their northern kinsmen. From whatever cause, some paralyzing blight of lassitude and ineffectiveness seems to have eaten its way into their energies. Against their cultured fecklessness the Czechs oppose the elemental force of racial ambition, the driving power of a people that has the conscious-

ness of a great destiny before it and feels itself on the top of the rising wave.

The Germans protest that they have educated themselves beyond the point where race is everything and cannot at this time of day be expected to return to first principles. It is of course tenable that the variety of parties into which the Germans are split up argues an advanced and broad political intelligence. At the same time it makes a poor barrier against the impact of a race that subordinates everything to a single practical end; and unless the Germans are prepared to see a great part of their old ascendency pass away, they must be ready to drop «theorizing,» take up the issue that has been forced upon them, and meet their antagonists with weapons not necessarily of their own choosing. In other words, they need simplifying if they are to combat the Czechs successfully. As it is, the Czechs for the last 30 years have been slowly driving them to the wall. City after city has fallen into their hands; Prague and Pilsen, that only a quarter of a century ago were German in tongue and sentiment, are now Slavonized down to their very street names. And in politics and industry as well as music and literature and the lighter arts, the past hundred years have seen the Czechs advance in a quite wonderful fashion. They have long ceased to fear the Germans, and with the disappearance of fear comes naturally the claim to equality. Moreover, the Czechs have a strong historical case. Four hundred years ago what are now the crown-lands of Bohemia, Moravia, and Silesia formed the Czech kingdom of St. Vacslav; and what is now Hungary was then the kingdom of St. Stephen. The Czechs offered their crown in 1526 to the Hapsburgs, at the same time, for the same reasons, and on the same conditions as the Magyars; stipulating only that they should retain their old rights of self-government. This contract, together with the Pragmatic Sanction, was the legal basis of the Hungarian rebellion of 1848. Th Czechs still use it to point the justice of their demands for a resurrection of St. Vacslav's kingdom, maintaining that their case is on all fours with that of Hungary, rests on the same documents, and is supported by the same coronation oaths. The Hapsburgs never quite lived up to their side of the agreement. They allowed the Turks to overrun Hungary at will, and when the Reformation came and the Czechs gathered round John Huss, they stamped out the heresy in blood and established a strong German colony along the northern borders of Bohemia for the protection of the faith and the suppression of the natives. The Czechs have kept their native tongue alive, and just across their borders are their kinsmen of the Russian empire. The card of Russian sympathy is often played, and after every fresh frustration of their national hopes follows the spectacle of 5,500,000 Czechs cautiously sounding the Czar's «racial instinct.» It is this that lends color to the common charge that the Czechs are disloyal, but it is to be noticed that when the situation is reversed and the emperor makes even the shortest step toward Home Rule, the Germans at once adopt their opponents' tactics, throw themselves into the arms of their Prussian brethren, and vow that sooner than stay and be swamped by a hated and inferior race, they would willingly exchange the Hapsburgs for the Hohenzollerns and enroll themselves among Kaiser Wilhelm's subjects. The suspicion cannot be avoided that these dramatics are at bottom intended for home consumption, and that the tune would be quickly changed if the czar or kaiser were to listen too seriously.

The whole history of the dual monarchy goes to show that real consolidation and unity can be effected only by the seemingly paradoxical method of allowing each nationality the widest possible freedom. Justice toward and equal treatment of all races is the only sure road to peace and permanency. It is a hard one for the Germans to tread, for it means the overthrow of an ascendency once paramount in every corner of the realm; but unless universal suffrage brings to the front an entirely new set of problems, trod it must be. The interplay of these racial ambitions has been complicated, sometimes retarded and sometimes acutely emphasized by a hundred differences of religious, economic, and purely political interests, all of which have representatives in the Reichsrath. They act upon one another under the shadow of the racial issues in a way that no foreigner can disentangle. The confusion of the country is worthily reproduced in the 15 distinct parties and the seven or eight languages that crop up in the Vienna parliament. Austria-Hungary is a polyglot chaos in which even Austrians do not profess to see more than a half light. The prophecies of disruption may therefore appear at least plausible. But it is one of the many paradoxes of the dual monarchy that it seems unable to break up. In part it is protected by the very diversity and number of the antagonisms it is obliged to house. A more visible bond of union is the army, in which all must serve, which is of all races and creeds, and therefore of none, and the atmosphere of which is broadly and impressively imperial. What its actual effectiveness will prove to be like, should it ever be tested, is one of the most interesting military problems of the day. The only force with which it can be compared in the excellence of its units and the variety of its nationalities and tongues is the allied army that rescued the Pekin legations; and the parallel is not altogether hopeful. A polyglot army must of necessity be to some extent a disorganized army, and while the forces of the dual monarchy use German as the language of military command, the rank and file and the bulk of the officers retain their own speech for general purposes. The heterogeneous character of its composition has had a steadying influence on the internal struggles of the dual monarchy, however much it may hamper its efficiency on the battlefield. The army has kept itself largely aloof from politics, and though the Czechs did once attempt to transfer the racial bitterness to the parade ground by answering the roll-call in their own tongue, a sharp rebuke from the emperor was enough to bring them to reason.

A second and equally powerful bond of union is the monarchy. Not only is it accepted everywhere, but the idea of upsetting it in favor of any other form of government has never yet been broached. Even the Kossuth irreconcilables, who would like to see the *Ausgleich* abolished and Hungary direct her own fiscal policy,—a quite possible development,—and manage her own foreign affairs, still do

not propose to sever the personal tie that binds the two countries. And not only is the monarchy secure in the affections of the people, but the dynasty is equally popular. So long as there is a throne it is not conceivable that any one but a Hapsburg should occupy it. This two-fold devotion to monarchy and to the dynasty has been greatly strengthened of late years, partly by the breakdown of parliamentary government and the weariness which has made the people look to the throne as an escape from the turmoil and wranglings of small groups, and partly through the patience and wisdom, the sterling fair-mindedness and competency of the present emperor, as well as the ghastly tragedies of his private life. But it is a curious delusion to argue that just because Francis Joseph is so adequate and well beloved, and comes so near to the ideal of what a constitutional monarch should be, therefore the empire must go to pieces when his moderating and persuasive influence is withdrawn. Such a reign as his is far more than a merely personal triumph; it is the consecration of a system; it exalts the monarchy as well as the monarch, and it smooths out the path for his successors by bequeathing to them an office made more illustrious by his example and memory, more powerful and more deeply based in the hearts of the people. So far from being a signal for dismemberment, the close of the present emperor's reign is more likely to witness a splendid rally round the house and throne of the Hapsburgs. The general peace of Europe would indeed be jeopardized in the event of a scramble for the fragments of the dual monarchy. But no such catastrophe is likely, for the reason that it is to no one's interest to bring it about. It is not for secession from, but for the fullest liberty within, the empire that "the numerous nationalities involved" are struggling. The only genuine secessionists are Herren Wolf and Schönerer and their followers, who wish to incorporate German-speaking Austria with the German empire. It is possible that their wishes may ultimately be gratified, but not in our time, not till after the next European war, if even then, and not till the clericalism of Austrian Germans has considerably toned down. What the Czechs and the other races want, is the same independence as the Magyars possess, and such independence is as inconsistent with Russian as with German domination. It is against their interests to break away from the Hapsburgs. The day of small states has gone by, and a lonely Czech kingdom could not exist for a year by the side of Russia.

Army.— Military service is obligatory on all citizens capable of bearing arms who have attained the age of 20, and lasts up to the age of 42, either in the active army, in the landwehr, or the landsturm. The period of service in the active army is 12 years, of which three are passed in the line, seven in the reserve, and two in the landwehr. In 1900 the standing army numbered 361,693 men (including officers) on the peace footing, and 1,826,940 men and 45,238 officers on the war footing.

Navy.— On account of the recent development of the Italian navy, Austria has found it necessary for her self-defense to have a fleet of her own, and the last ship of a new squadron was launched in 1904. The new ships are remarkable for their armament and speed, and will compare favorably with any equal number and size of ship in the world. Leaving out the ships constructed prior to 1887, the new fleet is composed of two battleships, the Erzherzog Friedrich and the Erzherzog Karl, of 10,600 and 10,100 tons respectively, and 19.25 knots speed. Each will carry four 9.45-inch Skoda guns of 40 calibres and twelve 7.48-inch of 42 calibres. The first will have in addition fourteen 2.75-inch and the other 2 of the same calibre, each being furnished with a full complement of small bore quickfirers. The 7.48-inch guns will fire four rounds a minute.

The next division is composed of three ships of 8,300 tons each, named the Habsburg, Babenberg and Arpad. Their speed is 18.5 knots, and the armaments three 9.4-inch and twelve 6-inch guns each, besides the usual complement of small calibre quickfirers.

Then comes a division of three coast defence ships, the Monarch, Wien and Budapest, of 5,600 tons each and 17 knots speed. Their armament of four 9.4-inch and six 5.9-inch each, with fourteen smaller calibre quickfirers, is extremely formidable for their size, and it is well disposed and protected, entitling them to be reckoned as battleships.

The cruisers of the Austro-Hungarian navy are, in order of size, the Kaiser Karl VI., of 6,250 tons; the Maria Theresa, of 5,370; and the Kaiser Franz Joseph I. and Kaiserin Elizabeth, of 4,060 tons each. Each carries two 9.4-inch guns; the first two eight 6-inch quickfirers; and the last two six 6-inch quickfirers each, with numerous small calibre pieces. Their speed is between 19 and 20 knots, and they hold a place between armored and protected cruisers.

Two ships classed as battleships, launched in 1887, the Erzherzog Rudolf of 6,900 tons and the Erzherzogin Stefanie, of 5,100 tons, may be added to the effective squadron and would raise it to fourteen vessels. Their armament is sufficiently powerful, consisting of three and two 12-inch, six 4.7-inch and six 6-inch guns respectively, with two 2.75-inch pieces each. Their speed is 16 knots.

There are three small cruisers of 2,300 tons each, the Zenta, Jaguar and Aspern; and three torpedo cruisers, of 1,600 to 1,700 tons each, the Panther, Leopard and Tiger. The seven torpedo boat destroyers, range from 310 to 610 tons, of 21 knots speed, and there is a small torpedo boat flotilla, which is being increased. Experiments are also in progress with submarines.

The personnel of the Austro-Hungarian navy is excellent, and should the squadron it can turn out ever be called on to act alone or as part of the naval force of an alliance, it can be relied on to give a good account of itself.

Judiciary.— The courts of first instance comprise 940 *Bezirksgerichte,* county courts, and 71 *Landes und Kreisgerichte,* provincial and district courts; *Geschworenengerichte,* or jury courts being connected with the latter. These courts act as courts of inquiry and have summary jurisdiction. The courts of second instance, or courts of appeal from the lower courts, having the supervision of the criminal courts, comprise 9 *Oberlandesgerichte* or higher provincial courts. There are also special tribunals for military, revenue, shipping, and other matters, including four industrial courts and three commercial courts. The *Oberste Gerichts und Kassationshof,* Supreme Court of Justice and Court of

Cassation, at Vienna, is the final court of appeal. The High Court of Administrative Affairs decides differences between private individuals and public officials, and the Reichsgericht, or Court of the Empire, the conflicts of law and jurisdiction between different authorities.

Bibliography.— Broglie, 'Frederick the Great and Maria Theresa'; Coxe, 'History of the House of Austria'; Gindely, 'History of the Thirty Years' War'; Leger, 'History of Austro-Hungary'; Lowell, 'Government and Parties in Continental Europe'; Ranke, 'History of the Reformation in Germany'; Slegnobos, 'Political History of Europe since 1814'; Whitman, 'The Realm of the Hapsburgs'; Whitman and McIlrath, 'Austria.'

Austrian Succession. See SUCCESSION WARS.

Au'thors, British Society of, an association of authors formed in London in 1883, for social and business purposes. It has a governing committee of 30 members; maintains an attractive club-room and publishes a periodical called 'The Author.' The late Lord Tennyson was its president till his death.

Au'thors Club, an American organization founded in New York in 1882, and incorporated in 1887. It is governed by an executive committee without a president. Any person who is the author of a published book proper to literature, or of creditable literary work equivalent to such a book, is eligible to membership. The club holds meetings semi-monthly, and gives Saturday receptions for ladies in the winter season. It has a library consisting of the publications of its members and another devoted to literary biography.

Au'thors, French Society of, an organization founded in Paris in 1837, for the protection of authors in their rights, and open to any man of letters. It is governed by an elective committee of 24 members, and has a pension fund which provides for aid in work, for sickness and in old age. Besides publishing a journal, the 'Chronique,' the society has collected a large sum of money from pirating publishers.

Au'thors, American, Society of, an organization founded in New York in 1892, and incorporated in 1895, having for its objects the promotion of a professional spirit among authors and a better understanding between authors and their publishers, and, in general, the protection of literary property and the advancement of the interests of American authors and literature. All persons engaged in literary pursuits are eligible to membership. The society has a pension fund for members who may become needy.

Auto de fe, ow'tō dā fā (Spanish); **Auto da Fe** (Portuguese), lit. "act of faith." See INQUISITION.

Auto-intoxication, a poisoning of the body by its own products. In the complicated processes that make up the sum total of human metabolism many products are formed which if not modified in some manner would poison and kill the body. The simplest illustration of this is seen in the function of respiration, in which the carbon dioxid in the venous blood is oxidized in the lungs and thus eliminated. The urine contains a number of bodies which if prevented from leaving the body would cause its death. Thus auto-intoxication may result from the normal products elaborated in the body if these are not modified, or are prevented an outlet. But the problem of auto-intoxication is much more complicated in many of its manifestations. Sick-headache, gout, diabetes, many neuralgias, Addison's disease, myxedema, acromegaly and many other obscure diseased conditions are known to be due to some form of perversion of the normal processes of metabolism and are instanced as forms of auto-intoxication. The general organs of defense in the constant play of these factors may be divided into two general groups, (1) those that have the function of transforming by chemical means many of the poisonous products of the normal metabolism of the body, and (2) those organs that are chiefly concerned in the elimination of these products. To the first group belong the liver, the mucous membranes, the thyroid, lymphnodes, the adrenal glands, the blood cells, the blood serum and the lymph. In the second group are the kidneys, the lungs, the skin, and the intestines.

Classification.— Auto-intoxication may result (1) from the failure of functions of certain organs having a definite chemical function. Pancreatic diabetes, bronze diabetes, pernicious anæmia, myxedema, acromegaly, cachexia, strumipriva, Addison's disease, these all come in this class; (2) by a faulty metabolism whereby normal amounts of waste products are not thrown off. Gout, diabetes, oxaluria, are examples of this type; (3) through retention of the normal physiological products in the organs themselves. Carbon dioxid poisoning is a type; (4) by means of excessive production of physiological or pathological products. Diabetic coma, cystinuria, acetonuria, uremia are types of this form. Such a classification is necessarily very inadequate and will be found to be of service only as a general framework on which a more exact systematization of knowledge may take place. Consult: Herter, 'Chemical Pathology' (1902); Vaughan and Novy, 'Cellulartoxins' (1902). See ANIMAL ALKALOIDS; METABOLISM; PTOMAINE; TOXICOLOGY.

Au'to Sugges'tion. See HYPNOTISM.

Au'tocrat of the Breakfast Table, The, a noted work by Oliver Wendell Holmes, consisting of imaginary conversations around a boarding-house table. The characters are introduced to the reader as the Autocrat, the Schoolmistress, the Old Gentleman Opposite, the Young Man Called John, The Landlady, the Landlady's Daughter, the Poor Relation, and the Divinity Student. It is the most popular of Dr. Holmes' books; and in none of them are his ease of style, his wit, his humor, his kindly sympathy and love of humanity, more clearly shown.

Automatic Telephony. See TELEPHONY, AUTOMATIC.

Autom'atism, in animals the power of movement or of action without any stimulus independent of that arising in the protoplasm of cells and tissues. Thus Descartes regarded animals (other than man) as "automata," and declared that they act independently of any volition, or instinctive or intellectual power or faculty; in other words, that their so-called mental acts are involuntary and mechanical — that they

may be compared to machines. In physiology while automatism is apparently the result of the internal conditions of the living body, yet strictly speaking, says Loeb, no animal movements are exclusively determined by internal conditions. The co-ordinated character of automatic movements, he says, has often been explained by a "centre of co-ordination," which is supposed to keep a kind of police watch on the different elements and see that they move in the right order. "But," he adds, "observations on the lower animals show that the co-ordination of automatic movements is caused by the fact that the element which beats most quickly forces the others to beat in its own rhythm." The swarm-spores of algæ, which possess no ganglion cells, show spontaneity equal to that of animals having ganglion-cells, and he concludes that automatism is due to a chemical cause; that is, the pressure or absence of certain ions, or, in other words, to the chemical constitution of the protoplasm. Consult Loeb, 'Physiology of the Brain' (1901).

Autom'aton, a mechanical contrivance whose actions are arranged to correspond to those of a human being. Friar Bacon had the reputation of having constructed a brazen head which spoke, and Regiomontanus an iron fly, which, after making the tour of the room, returned to its master. Albertus Magnus is said to have spent 30 years in constructing a human figure which advanced to the door when anyone knocked, opened it, and saluted the visitor. In the water-clock presented to Charlemagne by Harun al-Rashid, 12 doors in the dial opened respectively at the hour which they represented; they continued open till noon, when 12 knights issued out on horseback, paraded round the dial, and then returning shut themselves in again. Camus constructed an ingenious toy for Louis XIV., consisting of a carriage drawn by two horses, containing a little figure of a lady with a coachman and attendants. The coachman cracked his whip, the horses moved their legs naturally, and when the carriage arrived opposite the king's seat it stopped; the page stepped down and opened the door; the lady alighted and presented a petition to Louis. The flute-players, the tambour-player, and the wonderful duck of Vaucanson are celebrated for the astonishing ingenuity displayed in their construction. Among the most remarkable automata are the whist-playing and other figures designed by Maskelyne.

Automobile. The word denotes primarily: A vehicle designed mainly for transportation of persons on highways or over unprepared ground, equipped with an internal combustion, hydrocarbon-vapor engine, which furnishes the motive power and forms a structural portion of the vehicle. Secondarily, it is used as synonymous with "motor vehicle," denoting a vehicle moved by inanimate power of any description, generated or stored within it, and intended for the transportation of either goods or persons on common highways. As an adjective the word denotes broadly some relation to mechanically-driven vehicles. Even certain railway cars used on short feeder lines in France, Austria, Germany and Italy are known as "automobile railway cars" because they are driven by means of engines of types first used in motor vehicles, and, having passenger or freight space, also form independent, self-contained transportation units.

The automobile, in the more distinctive primary sense of the word, consists of:

(1) Fuel tank; (2) Carburetter; (3) Engine, with 3a, the Mechanism of the Cooling System, and 3b, the Ignition System; (4) Clutch Mechanism; (5) Power Transmission Mechanism, with 5a, Change-Gear Mechanism, and 5b Differential Gear; (6) Vehicle Frame and Springs; (7) Running Gear; (8) Brake Mechanism; (9) Steering Mechanism; (10) Carriage Work; (11) Lubrication System, and (12) Operating System, including the devices by which the operation of the vehicle is brought under control of hand or foot motions of the driver. These various portions of the automobile form an organic whole, being more or less interdependent, and sharp lines distinguishing one portion from another cannot always be drawn. The classification serves convenience in description, however.

1. *Fuel Tank.*—The source of the power developed by the automobile motor is a liquid hydrocarbon fuel (see HYDROCARBONS), which may be benzine, benzol, gasolene, naphtha, kerosene, crude oil, alcohol (pure or mixed with other hydrocarbons, or water), a solid hydrocarbon, such as naphthaline, that can be liquefied at a low temperature (79° C.), or calcium carbide (see ACETYLENE), throwing off hydrocarbon gas (acetylene) when moistened. In order to be utilized, the liquid fuel must be transformed into vapor, the vapor mixed with oxygen or atmospheric air, and the mixture ignited. Aside from the process of generating an unstable gas by vaporizing the fuel, the principle of the automobile motor is identical with that of the gas engine operated with illuminating gas (see GAS ENGINE).

The fuel tank is usually made of sheet copper and is provided with internal bulkheads to obviate swashing of the liquid. It should have as few seams as practicable, the solder should contain no ingredient soluble in the liquid the tank is intended to contain, and it should be mounted on a rigid foundation to obviate torsion, from which leakage might result. In most gasolene tanks a small air vent in the screw cap by which the charging aperture is closed permits the liquid to be drawn off gradually by gravity through a pipe leading to the carburetter. But the same air vent, if left open, causes loss of fuel by evaporation. By a more modern arrangement a small quantity of exhaust gas is piped into the tank at each exhaust stroke, supplying sufficient pressure to feed the fuel, even if the tank is below the level of the carburetter.

2. *Carburetter.*—Early carburetters were spacious and situated at some distance from the motor, connected by a pipe often 12 to 18 inches long and containing a diaphragm of wire gauze to prevent a flame from accidentally striking back to the vapor and liquid contained in the carburetter. Air was let into the latter from the atmosphere and brought in contact with a considerable area of the liquid (then always benzine, gasolene or naphtha), from which vapor was absorbed either by simple surface evaporation, or by forcing the air through the liquid, or by passing the air at high velocity through a narrow channel containing a wick saturated with the liquid. In all cases the suc-

tion stroke of the motor piston caused the air current.

The composition of the mixture drawn into the cylinder, to be fired, was regulated by an additional air channel leading direct from the atmosphere to the induction pipe. In warm and dry weather the duct leading through the carburetter was contracted and the direct air admission opening was enlarged, while in cold and damp weather this adjustment was reversed. The object was to obtain an explosive charge of unvarying quantity and composition for a motor intended for constant speed and power development, all necessary changes in vehicle speed being effected through the power-transmission gearing. In raw weather ice (from atmospheric moisture precipitated on the metal cooled by the evaporation of the fuel)

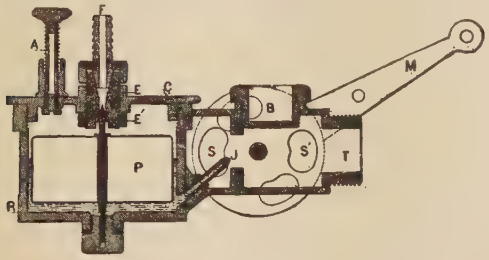

FIG. 1.— SIMPLE MODERN CARBURETTER, WITH AUTOMATIC ADJUSTMENT ACCORDING TO THROTTLE OPENING.

A, Floating plunger. B, Inspection screw to T. C, Cap carrying float feed adjustment. EE', Lock nut to V. F, Gasoline admission pipe. J, Gasoline nozzle. M, Regulating lever having disks formed with two openings to accord with S and S', in wall of mixing chamber. P, Float. R, Float chamber. SS, Air inlets. T, Induction pipe, to engine.

was frequently formed in the carburetter and induction pipe, clogging them. By degrees the method of heating the air, by passing it around the exhaust pipe, was learned, and all pipes were shortened. Still, starting a "cold" motor was an uncertain operation, often requiring preliminary heating of the metal, as it still does (1904) when the heavier oils are used as fuel.

The evolution of the modern carburetter was brought about by the necessity of regulating the force of explosions by a throttling system, to relieve the operator of frequent mechanical gear changes. The steps in this evolution were many and irregular, the most important one consisting in the employment of a nozzle from which the liquid fuel is drawn off in a spray by air suction, to take the place of surface evaporation. Thus the quantity of fuel introduced in each explosive charge is regulated by a mechanical factor which is under control, namely, the air current created by the suction stroke, and not materially affected by temperature and atmospheric conditions. This system requires a modification, however, because an air current will suck liquid gasolene from a nozzle placed in its path in proportion to the square of the velocity of the current (approximately), while the power developed is in simple proportion to the velocity of the piston. An automatic device is therefore required for reducing the air current which draws the spray of fuel, while increasing the current of atmospheric air when the motor speed is being raised, and *vice versa*. The difference in devices serving this purpose constitutes the main difference in carburetters.

3. *Engine.*—In adapting the gas engine to the automobile the first requirement, after devising the carburetter, was the reduction of weight and bulk. The heavy foundation and heavy fly-wheel were undesirable. A small cylinder with a piston working at high speed was preferable to a larger cylinder working with low compression and small piston speed. When weight was cut down and compression of the explosive charge was increased, it was found that the rapid succession of explosions shook the engine and vehicle in a manner destructive to the mechanism and disagreeable to the occupants of the vehicle. By lightening reciprocating parts of the engine, distributing the weight of rotary parts equably with relation to the axis of revolution, by building engines with two, three or four cylinders instead of one, and balancing the explosions in one cylinder against those in an opposed cylinder, but most of all by learning to graduate the volume of the explosive charges according to the requirements for power, excessive shaking and vibration were in course of years considerably reduced.

Equally good results have been obtained with cylinders lying horizontally and standing vertically, the former being more readily "balanced," the latter more easily inspected and repaired. Automobile motor cylinders are made of cast iron, seldom of steel. The pistons are of the trunk pattern, fitting loosely in the cylinders. Circumferential grooves in the pistons contain split iron rings (usually two or three at the upper and one at the lower end) sufficiently elastic to expand snugly against the cylinder wall. The high temperature produced in the cylinders by the successive explosions of

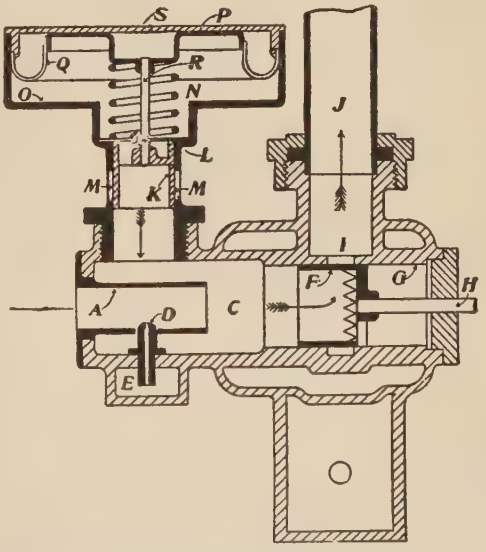

FIG. 2.— COMPLICATED MODERN CARBURETTER, WITH AUTOMATIC ADJUSTMENT ACCORDING TO THROTTLE OPENING AND PISTON SPEED.

I, inlet to induction pipe J to cylinder. F, throttle piston (to uncover aperture I more or less) actuated by rod H to governor. charges compressed 75 to 100 pounds per square inch before ignition preclude the use of packed fits.

Throttling of the explosive charge is accomplished by obstructing the induction pipe between the inlet valve and the carburetter nozzle by means of a butterfly valve, or in any other suitable manner. Excessive speed of the motor under light load or when running idle is obviated by a centrifugal governor acting usually upon the throttle valve, but in some instances upon the exhaust valve. In small motors the inlet valve is usually automatic, opened by the suction in the cylinder against the resistance of a helical spring as in a gas engine; in large motors the inlet valve is frequently actuated from the cam shaft, as is the exhaust valve when opening, and with this construction throttling of the motor is sometimes effected by shutting the inlet valve before the suction stroke is completed.

In four-cylinder motors reduction of the power development was until 1902 commonly effected, when required, by preventing ignition in one or two of the cylinders, and also by shutting the exhaust valve before the exhaust stroke was completed, thereby setting up internal resistance and also reducing the volume of the next explosive charge, while changing its composition by mixing it with the remaining exhaust gases. These methods are now (1904) almost abandoned. The earliest means of reducing the effective power of the motor consisted in retarding the ignition, so that the combustion would not be finished when the exhaust valve was opened. This method is still generally used, but only as an auxiliary to the throttling of the explosive charge.

Mufflers.—When the burnt gases are exhausted from the cylinder they are still of high temperature and of high tension and their escape into the atmosphere is therefore accompanied by a report-like noise. To subdue this noise a muffler is employed, consisting of an expansion box through which the gases must pass and in which the current of the gas is partially obstructed and subdivided. One of the most efficient mufflers consists simply in a box filled with parallel plates turned edgewise against the current of gas.

3a. *The Ignition System.*—When the mixture of gasolene spray and air (usually heated by contact with the exhaust pipe) reaches the inlet valve of each cylinder, the fuel is partially or wholly vaporized and absorbed in the air current. Entering the cylinder, some recondensation takes place if the cylinder walls and piston are cold (as at the start), but the next piston stroke compresses the charge to a small volume (usually ¼ to ⅓ of the whole cylinder volume), and thereby heats its and prepares it for ignition. The means employed for igniting the charge consisted at first altogether, and still occasionally, in a kerosene lamp (later pattern: an alcohol vapor lamp) over the flame of which (later: *in* the flame) a platinum tube was screwed into the upper end, or combustion chamber, of the cylinder. The outer end of the tube was closed and brought to red heat or incandescence by the flame.

By the compression stroke a small portion of the charge was forced into the tube and fired back into the cylinder when it reached the hot portion of the tube. The ignition took place at the highest compression or slightly earlier or later, varying according to the piston speed,

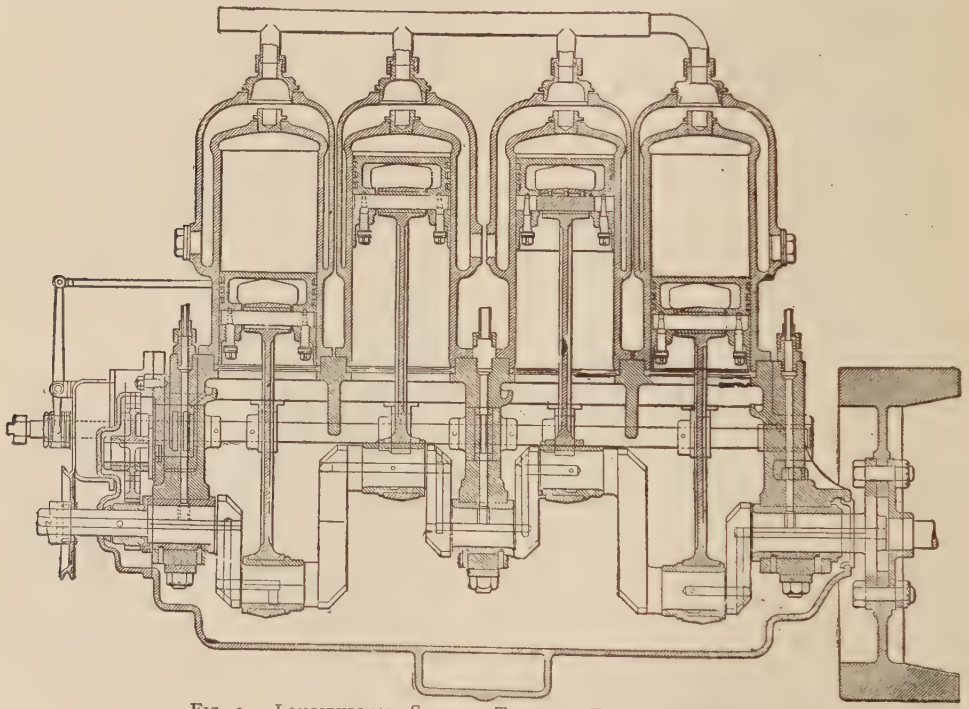

Fig. 3.— Longitudinal Section Through Four-Cylinder Motor and Flywheel Clutch.

Copyright by the Scientific American.

but the variation was insufficient to give the highest power at the highest piston speed and yet not too early for low speed, because the whole charge should be aflame and expanding with maximum force shortly after the power stroke has begun and, when the piston moves with high velocity, this cannot be accomplished unless the ignition begins long before the compression is at its maximum, the time required for spreading the flame being almost constant for a vapor mixture of given composition.

The method was also unadapted for a motor in which the new throttling system introduced

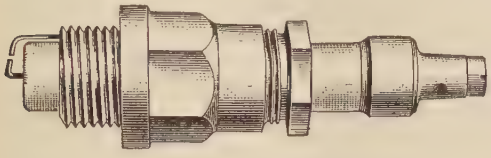

Fig. 4.— Jump Spark Plug.

variations in compression, and the open flame of the lamp was a source of danger in case of gasolene leaks or road accidents. So, when the throttled fuel admission came in vogue, «hot tube» ignition, despite its reliability, was gradually abandoned in favor of the electric spark, produced internally in the cylinder head by (1) a dry battery; (2) an induction coil (see INDUCTION), causing a high-tension current; (3) an interrupter or «trembler,» and (4) a switch turning the current off and on at the proper time, operated from the same camshaft from which the exhaust valve is opened. A «spark plug» contains the two terminal wires, insulated by porcelain, lava or pressed mica within a hollow metal screw plug, and is screwed into the cylinder head. The terminals are about 1-16 inch part, and this is the length of the «jump

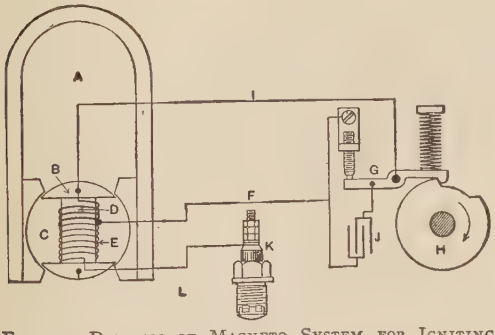

FIG. 5.— DIAGRAM OF MAGNETO SYSTEM FOR IGNITING EXPLOSIVE VAPOR MIXTURE BY PRIMARY CURRENT JUMP SPARK.

A, permanent field magnets; B, armature of H-section; C, armature coil wound in two sections, D and E, connected in series; F, wire to one terminal of circuit breaker G, worked by cam H; I, grounding wire from other terminal of G to metal of armature and thence on to metal work of motor and vehicle; J, condenser in parallel with G; K, spark plug, wired from E's outer terminal.

spark.» The metal mass of the vehicle frame serves to «ground» the current. The wiring throughout is insulated. Instead of a jump spark a «hammer spark» or a «wipe spark» may be used.

The main drawback to this arrangement arises from the fact that the life and potentiality of dry batteries vary greatly, so that they often fail unexpectedly. Storage batteries are used in their place in many European automobiles, but these, too, eventually give out and must be recharged. A dynamo, however, driven by the vapor engine, furnishes a current for ignition so long as the mechanism remains in order, rendering the ignition an automatic function. While the other methods remain in extensive use, the dynamo driven by belt or gear from the motor shaft, is fitted to most high-powered automobiles, especially in the form known as the magneto.

In the further development it became customary to use both the magneto, either high tension or low tension, and a storage battery, the latter being required for starting the engine from the seat by turning on the electric spark in that one of the cylinders in which an ignitable charge remained after the last stop.

3b. *The Cooling System.*— Part of the heat generated by the explosions is transformed into the work of driving the piston, but a large portion is absorbed as heat in the piston, cylinder walls, valves, etc. These, unless artificially cooled, become so hot as to ignite the lubricating oil, and also the next explosive charge before the piston is in position to receive a new impulse. Such premature ignition drives the piston back in the direction opposite that de-

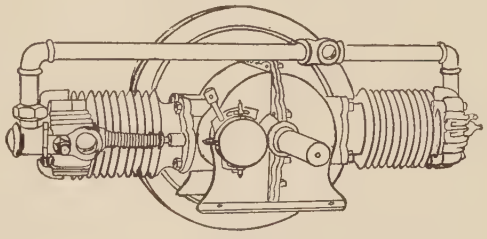

Fig. 6.— Horizontal, Two-Cylinder, Air-Cooled Automobile Engine.

sired and stops the motor. The burning of lubricating oil also leaves a deposit on walls and valves which soon interferes with piston travel, valve action and spark ignition. The means adopted to keep the motor sufficiently cool are in brief as follows:

Small cylinders (up to 2 horse-power) may be ribbed externally, thereby increasing the metal surface, from which heat is lost by radiation and contact with the atomsphere. Rapid motion, constantly bringing fresh cool air to the heated metal, is essential to render this system efficacious. When the motor works at full charges while the vehicle is at rest or moving slowly, renewal of the air must be effected by a blow fan or equivalent means. A few automobiles are operated with air-cooled motors; some of them are now equipped with a fan, but until recently the motors were usually shut down when the cars were at rest, and the vehicles are not adapted for heavy, slow

work. The smaller each cylinder, the more acceptable the air-cooling method, because a small cylinder has more radiation surface in proportion to the volume of vapor burned than a large cylinder.

Ordinarily the automobile cylinder is kept at the proper temperature by means of a "water jacket" surrounding cylinder and valve chamber, a water circulating pump (driven from the motor shaft) and a "radiator" consisting of a nest of coiled tubes. The latter are strung with metal fins, soldered on, to increase the radiation area. A water tank is connected with this system. The order of circulation is from water jacket to radiator, thence to the tank through pump and back to the water jacket. The pump is usually of the centrifugal class, sometimes "rotary" (see PUMPS), and in a few automobiles is omitted, circulation in that case depending solely upon the difference in temperature between the water in the jacket and that in the radiator, the latter being unusually large.

By increasing the dimensions of the pump, to produce more rapid circulation, and reducing the diameter of radiating tubes while increasing their total radiation surface, the amount of water to be carried and the capacity of the tank, have been gradually diminished. With the so-called "honeycomb" coolers the water tank is almost dispensed with, consisting of only two small compartments framing a network of flattened tubes erected in front of the motor, through which air is drawn rapidly by means of an exhaust fan, usually forming the spokes of the engine fly-wheel. The air current in this case is defined within a closed motor hood. In other cases the hood is provided with slits. In the winter when water might freeze and burst water jacket, cylinder or radiator, calcium chloride or glycerine is admixed to lower the freezing point, or a special oil distilled from crude petroleum is used instead of water.

The water jackets were up to 1903 commonly cast integrally with the cylinders, cylinder heads and valve chambers, but the difficult cored castings were often faulty, especially when only cylinder heads and valve chambers were jacketed. More recently sheet copper has been secured to flanges on the cylinders, etc., so as to form a jacket between the copper and the plain cylinder casting, and weight reduction as well as some elasticity (affording security against accidental freezing of the water) have been gained thereby, while the quality of castings has been improved.

With reference to sheet copper jackets, it is now noted, however, that difficulties were experienced in securing the joints against eventual leakage and in 1906 only three or four firms continued to employ this method, while the art of producing sound castings of complicated design and with integral jackets and cylinder heads had advanced greatly.

4. *Clutch Mechanism.*— A vapor engine, like the gas engine, must be started by hand power, or auxiliary power of some kind, as no power is stored in it while at rest. It cannot be started, therefore, under load without an inconvenient effort, and every automobile vapor engine (excluding those used on motor bicycles and motor boats) is arranged to be started running idle to be subsequently connected with its load by a clutch. Often there is a separate clutch for each rate of gear reduction. In earlier automobiles this was the rule, while now (1904) it is the exception. All the various forms of clutches used in other branches of mechanical engineering have been tried on automobiles, all being more or less perfectly adapted to the requirements: That they shall grip a motor shaft revolving at high velocity without sudden seizure; that they shall be automatically self-adjusting to wear within a considerable range and further adjustable by a screw or other convenient means; that the clutch surface shall be large enough and smooth enough to obviate injurious heating when slipping, and that the release shall be positive, without requiring much physical effort.

The clutch most commonly used in those automobiles having the motor shaft disposed longitudinally of the vehicle, consists of a male truncated cone (angle 10 to 12 degrees), engaging a corresponding female cone formed in or attached to the rim of the motor flywheel. The male cone is leather faced, and is secured, slidingly, to the transmission gear shaft, a strong helical spring pressing it forward (or, in later construction, drawing it back) into the female cone. To secure concentricity of the two cones the transmission gear shaft is usually journaled in the end of the motor shaft (carrying the flywheel) by a ball bearing, and end thrust at this point is obviated in modern design. The engagement of the clutch is effected by a clutch lever which releases the spring, permitting the cones to come together. The same action usually releases one set of brakes, which is intended to be used only when the motor is disengaged from the driving gear. After disengaging the clutch it requires a further movement of this lever to set these brakes.

During 1905 and 1906 the cone clutch yielded its popularity for high-class automobiles to the internal expansion clutch, which consists of two segments expanded by toggle levers or similar means against the inside of a drum formed upon the flywheel, and to the multiple-disk clutch, consisting of many small disks secured to the clutch shaft, alternating with an equal number of annular disks secured in the flywheel; both series of disks being keyed against rotation but free to slide.

5. *Power Transmission Mechanism.*— In starting a heavy car from a standstill by clutching a rapidly revolving motor shaft, there would be danger of breaking the connections between the clutch and the rear wheels (which are the driving wheels in nearly all automobiles, so far), or of stopping the motor by the resistance, unless the latter were reduced by gearing permitting the vehicle to move slowly while the motor shaft revolves at high velocity. As motor power is proportional to motor speed, under a given load, the necessity for at least one gear reduction between motor shaft and driving wheels remains, even with modern motors capable of being throttled to low speed, the power of the higher speed being frequently required for overcoming the inertia of the vehicle — on hills, for example.

As a matter of fact, most heavy automobiles have three geared driving connections and one

GASOLINE TOURING CARS.

direct connection for going ahead, and one geared connection for driving backward, while lighter vehicles have one gear reduction for going ahead and one for reverse, besides the direct drive ahead. In all cases the motor speed alone determines the power available at the moment, and the motor speed in conjunction with the driving gear employed determines the vehicle speed. The art of driving an automobile consists largely in using the smallest gear reduction (the «highest gear») and the smallest motor speed that, combined, will produce the desired vehicle speed. Before motors could be throttled to give a wide range of power development, the art of driving consisted largely in the manipulation of the levers by which the gear reduction was changed. The development has been from gear control of the vehicle to throttle control of the motor; under both methods the brakes are freely used as an auxiliary, especially in congested traffic.

Hundreds of transmission systems have been, and are, in use, and are described in textbooks on the subject. The mechanical elements of which they are composed are mainly those well known in machine tool practice: the belt, spur wheel, bevel gear and shaft, the countershaft, sprocket wheel and chain. From 1886 to 1902 belts were employed to transmit power from a transverse motor shaft to a parallel countershaft in automobiles evolved from the model first designed and built by Karl Benz, of Mannheim, Germany, in 1886. By a series of stepped pulleys, any pair of which could be clutched and keyed to the shafts, respectively, this belt system served also as engagement clutch and change-gear device. In commercial competition with toothed-gear transmission, patterned after the vehicle designed by Gottlieb Daimler, of Cannstatt, Germany, also in 1886, the belt system gradually lost favor, probably more by reason of the energy and ingenuity applied to the general improvement of vehicles equipped with tooth-gear transmission and change-gear devices, than owing to any intrinsic superiority of the gear drive. For the present (1904) belt transmission is practically abandoned. A surviving adaptation of the principle is the «expansion pulley» belt transmission system, which also takes the place of all change-gear mechanism. Only one belt is used, which has broad chamfered edges and transverse reinforcing strips sufficiently rigid to permit the belt to ride mainly on the edges over V-pulleys of changeable diameter. When the driving pulley is expanded the driven pulley is correspondingly contracted. The gear ratio may in this manner be altered by insensible graduations. See Pulley.

Fig. 9 shows one pattern of power transmission in a vehicle with a transverse motor shaft. Fig. 10 shows the system of bevel-gear transmission, through change-gear mechanism, to a differential gear on a countershaft and sprocket-and-chain transmission from the ends of the latter to the rear wheels, the rear axle being fixed. Fig. 11 shows the system of bevel-gear transmission, through change-gear, to a differential gear on a divided rear axle which revolves and turns the wheels keyed to it. In modern construction of this type the rear driving axle is relieved of the support of all weight, being contained within a tubular supporting axle, brazed or bolted to the differential gear casing, on the ends of which the wheels are mounted by ball or rolling bearings, while the driving-axle-ends are keyed to the external faces of the wheel hubs.

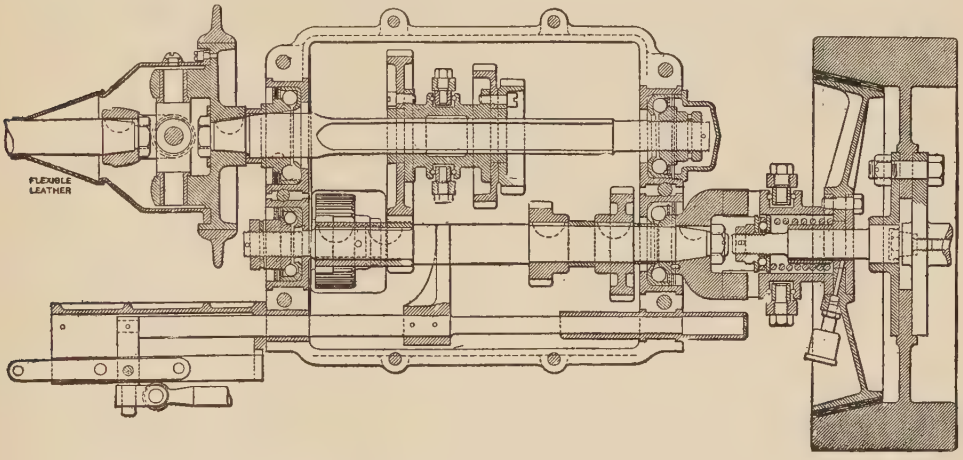

Fig. 8.— Cone Clutch (to the right), Sliding Gear Mechanism and Universal Joint (to the left) to Bevel-gear Shaft.

5a. *Change-Gear Mechanism.*— The primitive change-gear included a clutch or key for each gear ratio. With numerous variations, the general principle is as follows: To the transverse motor shaft, prolonged beyond the flywheel, are rigidly secured spur wheels of varying diameter. On a parallel countershaft are mounted other spur-wheels meshing pairwise with those on the motor shaft, but free to rotate around their own shaft, instead of with it, unless clutched. To a small spur wheel on the motor shaft corresponds a large one on the countershaft, and this combination produces, of course, the low countershaft speed which can be still further reduced by transmitting the motion from a small sprocket wheel at the end of the countershaft to a larger one on the rear wheel of the vehicle.

Suppose the speed is divided by five from motor to countershaft and further divided by three by the sprocket chain ratio, the total reduction is then from 15 to 1; the wheel revolves once for fifteen revolutions of the motor shaft. The vehicle speed will further depend upon the diameter of the rear wheels. If this is about 34 inches, making the circumference about 9 feet, and the motor shaft revolves 900 times per minute or 15 times per second, the rear wheels, revolving once per second, will advance the vehicle 9 feet per second or 540 feet per minute. In ten minutes the car will have traveled 5,400 feet, or somewhat more than a mile, corresponding to between 6 and 7 miles per hour. By throttling the vapor admission the motor speed may be reduced to 200 revolutions per minute, reducing the vehicle speed to 1⅔ miles per hour. In early automobiles, where throttling was not so effective, the brake served to reduce the motor speed by increasing the resistance.

While one pair of spur wheels drives, the several other pairs are, with this system, in mesh, but revolve idly. This accounted largely for the metallic noise of the earlier models. One of the pairs of spur wheels was not strictly in mesh but a small intermediate pinion on a rock shaft transmitted the motion to the spur wheel on the countershaft, thereby reversing its direction and causing the vehicle to be driven backwards when the clutch was applied to this purpose. Clutch levers and change-gear levers were identical, and were so interlocked that only one clutch could be set at one time. Modern developments of this system are much simplified, mainly by the employment of epicyclic gears.

The change-gear system which was developed when the engine was placed in the front portion of the vehicle with the motor shaft in the plane of the lengthwise axis, was designed to reduce noise, wear and waste of power, by having only one pair of spur wheels in mesh at one time. It is known as the clash-gear or sliding-gear system (see Fig. 8). The shaft carrying the cone clutch has a universal joint coupling it to a shaft in prolongation of it, the latter carrying spur wheels of different diameter rigidly secured. It is journaled in an oil-tight casing hung in the vehicle frame. Lower in the same casing is journaled a parallel squared shaft carrying a slidable sleeve with rigidly secured spur wheels so disposed that, in one position of the sleeve, none of these spur wheels is in mesh with any of those in the fixed, upper shaft. But when a fulcrumed fork, acting against a flange of the sleeve causes the latter to slide a short distance, one pair of gears, say, the lowest gear, are engaged. A further motion in the same or the opposite direction, releases the low gear and engages the second gear. A still further motion releases the second and engages the third; and in the same manner the fourth and the reverse are engaged and released. A small pinion on a special rock shaft produces the reverse, as in the older system. The edges of the spur teeth are rounded to facilitate meshing, and the cone clutch is automatically released while a change of gear is made; yet it

requires rapid and resolute manipulation of the change-gear lever (or levers) to avoid burring of the spur wheels.

Ingenious arrangements are made in many cars to have consecutive motions of the gear lever produce a consecutive transition from the lower to the higher gear, and *vice versa*. In some cases the upper shaft is divided into two portions, the rear one of which, in its foremost position, grasps the front portion by a hollow square while all spur wheels are disengaged, thereby transmitting power direct from the motor shaft to the differential gear without speed reduction. The advantage is always bought at the cost of more gear complications for the lower speeds.

5b. *Differential Gear.*—This apportions motion between the two rear wheels, permitting one to revolve faster than the other, as at turns, where the outer wheel describes a longer curve than the inner one. The differential gear used in automobiles was at first the same as used in other mechanical constructions (see DIFFERENTIAL GEAR), consisting of two bevel-gear plates, of equal diameters, mounted on the contiguous end portions of the divided shaft, designed to be revolved, and four bevel-gear pinions journaled radially between the two gear plates and meshing with them. Motion transmitted to the ring holding the outer ends of the pinion shafts, cause both bevel-gear plates to revolve equally, unless one resists more than the other, in which case the small pinions revolve and permit the plate which moves easier to move farther. In the United States a form of differential gear was developed in connection with automobiles, in which straight spur wheels and pinions took the place of bevel-gears.

6. *Vehicle Frame and Springs.*—The need of a special metal frame for supporting the machine portions of an automobile has been realized only by degrees. The small motors of early vehicles were mounted either in the wagon box at the rear of the seat (only one seat), with two radius rods running from the motor shaft to the rear axle (so as to keep the sprocket chain at even tension), or on a rigid frame of angle iron or steel tubes extending from the rear to the front axle. The latter method survived in a few instances up to 1900 and is now observed only in some heavy vehicles intended for slow hauling of goods, in which the absence of spring suspension for the motor mechanism is not so injurious as in fast-moving cars. Metal reaches between the two axles, serving merely to brace the construction, survived longer, but finally disappeared with the general adoption of a rigid steel frame supported by four semi-elliptical springs and carrying the entire mechanism as well as the vehicle body. Some notable American exceptions to this rule have inverted elliptical springs transversely in front instead of the two semi-elliptical springs, giving the front axle more freedom to oscillate, as required when traveling over rough ground. Many popular small American automobiles form another exception, having the entire frame secured by clips to the inactive middle portions of two side leaf-springs, whose bent-down rear and front portions are secured to the rear and front axles, respectively (see Fig. 9).

At first most frames were made of wood or drawn steel tubes brazed together (an adaptation from bicycle construction). Subsequently greater rigidity was attained by armoring the wood with steel flitch plates, or by the use of structural iron or steel in various shapes, bolted and riveted together. This was convenient for experimental work, changes being easily effected. When the types of vehicles became more defi-

nitely accepted. frames pressed in one piece from large blanks of sheet steel made their appearance. P ns of sheet steel joined the side reaches forming a protection underneath against mud and dust and prevented oil drip.

The springs used in automobiles are generally common carriage leaf springs calculated for such weights as they are intended to support. In course of time their length and weight have been gradually increased, with a view to combining strength with great flexibility. In case of side springs extending from axle to axle, as referred to above, this tendency influenced and modified the general design of the vehicles.

7. *Running Gear.*— In this division may be included axles, wheels and tires. Nearly all early automobiles (1890 to 1898) were equipped with wire-spoke wheels, the spokes laced tangentially to the hub on the suspension principle borrowed from bicycle construction. These wheels have given way to stout wood wheels, seldom more than 34 inches in diameter, built around a metal hub and enclosed in an iron ring to which a solid or inflated rubber tire is attached. The pneumatic or air-inflated rubber-covered canvas tire is used almost exclusively for pleasure automobiles, and its maintenance involves from 25 per cent to 50 per cent of the cost of operating a vehicle. On the other hand, air-tires afford a cushioning action, supplementary to that of the carriage springs, which protects machinery and wheels, especially against lateral shocks, in a manner for which no substitute has been found for vehicles intended for a speed above 15 or 20 miles per hour. At such and higher speeds the tire resiliency is characterized by the avoidance of vertical recoil.

Automobile wheels are also made of steel tubing, locked and brazed in a steel hub; elastic wheels with S-shaped spokes of tempered metal leaves have been tried, as well as composite wheels involving a cushioning medium between the felloe and the hub. So far (1904) the wheels have not been dished (to gain strength), as inclined or "set" axle ends do not lend themselves readily to traction from one motive centre, but front wheels are sometimes arranged to revolve in a slightly inclined (2°) plane, with a view to facilitating the steering operation by bringing the ground contact of the wheel directly under the pivot pin, a design of special value on rough ground where slanting impacts at the wheel rim would otherwise tend to turn the wheel or strain the steering gear.

The front axle of automobiles is stationary and frequently bowed down at the middle to permit a low position of the motor. To each end, just beyond the spring clips, is brazed a "knuckle" or fork, in which is journaled a pivot pin carrying at right angles, or slightly inclined, the rock shaft around which the front wheel revolves, usually on ball or roller bearings. The pivot pin is mounted in end-thrust ball bearings. Each pivot pin carries, besides the wheel shaft, a lever arm, projecting either forward and slightly outward, or rearward and slightly forward. The arms are connected by a rod, synchronizing the turning of the two wheels. The steering gear acts upon this rod or upon an additional arm on one of the pivot pins. The "fifth wheel" device has never been generally used in automobiles, being practical only when steadied with the leverage of a long pole, as in horse-drawn vehicles.

The bearings in automobile wheels were first plain "parallel bearings," then mostly ball bearings. Then followed a reaction favoring plain bearings. Lately ball bearings (in Europe) and roller bearings (in America) are usually fitted and, if well made and calculated for their loads, give satisfaction and reduce traction resistance, besides being more durable than parallel or coned shaft bearings.

Rear axles are either stationary (solid, tubular or H-shaped), carrying wheels revolved by sprocket wheels and chains, or rotary and divided near the middle by the differential gear, the wheels keyed to the axle ends and the bearings clipped to the vehicle springs. It was early found, however, that an axle supporting the

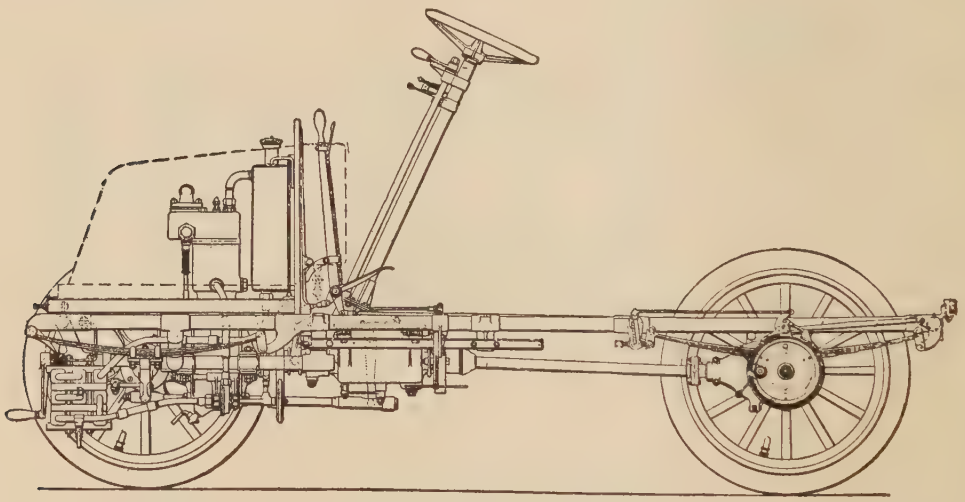

FIG. 11.— SIDE ELEVATION OF AUTOMOBILE CHASSIS.

2. American Touring Car 1906, with Air-cooled 4-cylinder Engine and Dummy Radiator Front.

greater portion of the vehicle's weight should not be subjected to the alternating stresses resulting from rotation, unless it was made much stronger, theoretically, than a fixed axle. Gradually the divided and revolving axle was therefore modified until a design was developed separating motive power from support, as explained under Power Transmission.

(8) Brake and (9) Steering mechanism, and also (10) Carriage work are essentially constructed on the same principles in vapor engine automobiles as in motor vehicles in general and are referred to under Motor Vehicles.

11. *Lubricating System.*— The lubrication of vapor engines presents certain difficulties caused by the very high temperature of pistons and cylinder walls, and the liability of fouling valves and spark points if an excess of lubricant is used. A thin oil of high flash and ignition test is required, but it is of still higher importance that the oil shall not "crack"; that is, split into portions which burn completely when ignited and other portions which leave a residue. The mercantile method of placing different oils on the market under the same name, and the same oil under different names (allowing agents to name it), has obscured lubricating problems and re-

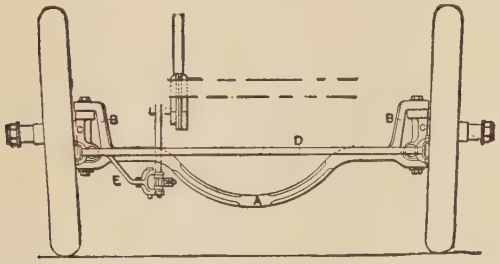

Fig. 12.— Elevation of Automobile Front Axle with Knuckles, Steering Pivot Pins, and Inclined Wheel Shafts.

A, Front Axle; BB, Knuckles; CC, Pivot pins; D, Rod connecting arms on pivot pins; E, connection from arms to steering gear (not shown).

tarded uniformity in practice. With vertical cylinders it is customary to place a quantity of oil in the crank casing and depend upon lubricating the cylinder and connecting rod by the oil splashed from the casing by the rotation of the crank. For horizontal cylinders sight feed drip lubricators regulated by hand have been extensively used, as they still are for steering gear, transmission gear and wheel bearings, but the most approved practice demands a force feed system operated from the cam shaft of the engine, so as to proportion the feed to the engine speed.

It is common practice to stuff the change-gear box with grease (vaseline and graphite is a popular mixture) and to use cylinder oil for all other bearings. Mechanical oilers distributing the oil from a central reservoir, often placed on the dashboard, through a system of canalization and by pressure derived from small positive plunger pumps within the reservoir, driven by gear or chain from the cam shaft, are generally employed.

12. *Operating System.*— The devices by which the operator of an automobile controls the motor, clutch or clutches, the change-gear, brakes, steering wheel and the lubrication system have undergone many changes and remain much diversified. The starting device is nearly always a detachable crank fitting the squared end of the motor shaft, either in front of the vehicle or at the side. The motor, when started, automatically releases the crank, the turning of the shaft pushing the crank out of engagement by a screw action supported by a spring. In many automobiles a small lug prevents the insertion of the crank if the ignition device happens to be adjusted to give an early spark which would start the piston in the wrong direction, and whereby the crank might be thrown violently back, injuring the starter.

The spark-timing handle and the throttle handle are generally placed close to the steering wheel (or steering lever), while one band brake (usually acting on the circumferential ring of the differential gear), and the cone clutch are actuated by one or more pedals. The change-gear lever (sometimes two) and the brake lever (actuating band brakes contracting around, or expanding into, drums in the rear wheels) usually extend through slots in the footboards, or at the side of the vehicle within convenient reach of the operator's right hand. In a few cases the operating devices are at the left side, the operator's seat being there. Automobiles vary more, perhaps, in the arrangement of operating devices than in any other feature of construction, and a brief general description covering established practice is therefore impossible.

In the broadest definition of "automobile," which is sanctioned by common usage, the word may be applied to any mechanically propelled vehicle, whether the source of power is a vapor engine, or steam engine, an electric accumulator or storage battery, stored compressed air or any other form of primary or secondary generator, but historically the word was not coined or applied until (about 1888, it seems) the appearance in France of benzine vapor engine vehicles, while steam cars for common highways antedate locomotives, having been made, especially in England, before the railways were thought of. The development of electric vehicles also began independently of the vapor engine vehicle. If a distinction should be made between automobiles and motor vehicles — and the distinction would be a convenience in nomenclature — the latter term should be the broader one, including all forms of power, while "automobile" should be reserved for motor vehicles equipped with a vapor-explosion engine and driven by purely mechanical transmission of power from the engine shaft.

Recent Development.— From 1904 to 1906 the development of the automobile in America was marked by a very general adoption of four-cylinder engines, even for vehicles of small size, and by a wider use of the air-cooling system, both resulting in a remodeling of the "runabout" style, with its single-cylinder engine in the middle portion of the frame. The single-chain drive to the rear axle was usually replaced by a bevel-gear shaft. The characteristics of the "runabout" were thereby removed; it became simply a "small car" for two persons, often equipped with sliding gear transmission. The epicycle transmission gear, on the other hand, found extensive employment in delivery wagons and trucks, being more easily operated by inexperienced drivers. Two-cylinder engines, of the

horizontal, "double-opposed" type, were commonly used for these business vehicles and were second to the four-cylinder engine in popularity for pleasure automobiles of medium size and power.

In general, the development was toward greater refinement in all details of the vehicles, but at the same time the increased reliability of the gasoline engine was seized upon by some manufacturers as a signal for a return to the "gasoline buggy" type, a vehicle built as an ordinary buggy or surrey placed on a steel frame, however with a horizontal, two-cylinder engine underneath it and a very simple steel cable driving device to pulleys on the rear wheels; the reverse being operated by a small sheave acting by direct frictional contact upon the solid tires of the large dished carriage wheels.

In practically all automobiles the tread pedals, or piano pedals, used for control of clutch and brakes and sometimes for the throttle, as well, were replaced by pedals pushed forward by the foot instead of down.

In accordance herewith, information in regard to steam and electric vehicles for common roads, as well as vehicles propelled through electric motors deriving their current from either a steam or a vapor engine, will be found, together with general information applying to all types, under MOTOR VEHICLES.

MARIUS C. KRARUP,
Formerly Editor of 'The Automobile.'

Automobile Speed Records. The most important affairs in the world of automobiling, from the viewpoints of record-making and breaking, enthusiasm and excitement, are the Glidden Tour, the Auto Show, and the Vanderbilt Cup Race. This latter event, inaugurated in 1904, was, for that year, over a 30-mile triangular Long Island course. The records made and the big attendance, 50,000, stamped this cup race as certain to become a great national annual affair in the realm of outdoor sport. George Heath, an American, was the winner, in a French Panhard. Lytle, also an American, finished third in an American-made car, a 24-horse-power Pope-Toledo. The exact distance was 284.4 miles; time, 5 hours, 26 minutes, 45 seconds; the average rate of speed being 52.2 miles.

The second Vanderbilt Cup Race, held October 14, 1905, resulted in the triumph of Hemery, a Frenchman, in a Darracq car, Heath's Panhard being second. The distance covered was 283 miles; time, 4 hours, 36 minutes, 8 seconds, the average rate of speed being 61.51 miles per hour.

The third Vanderbilt Cup Race, held on October 6, 1906, was won by Louis Wagner, a Frenchman. The distance covered was 297.1 miles; time, 4 hours, 50 minutes, 10 seconds. The average rate of speed per hour being 61.43 miles. More than 250,000 people witnessed the event.

Grand Prix, Sarthe Circuit (France), 766 miles, 12 14.07. Florio Cup Contest, Brescia Circuit (Italy), 311.12 miles, 4.46.47. 1905 Ardennes, Ardennes Circuit, 372.8 miles, 5.58.-32½. 1905 Bennett Cup, Auvergne Circuit, 341.4 miles, 7.10.00. 1906 Ardennes, Ardennes Circuit, 376 miles, 5.38.00.

Auton'omy, the self-government of a state. This power may reside within limited bodies of the same people, such as parishes, corporations, religious sects. These districts or communities may be autonomous, if not absolutely, yet within certain defined limits. They may be said to enjoy a partial, limited, or local autonomy. Autonomy is often used to designate the characteristic of the political condition of ancient Greece, where every city or town community claimed the right of independent sovereign action. Recently the word is more specifically used of territories or provinces, which, while subject in some matter to a higher sovereignty, are autonomous in other respects. Thus the Treaty of Berlin made eastern Rumelia an autonomous province; though subject to the direct political and military authority of the Sultan, it was to have administrative autonomy in all its internal affairs. Egypt possesses a higher autonomy. The self-government enjoyed by the British colonies may be described as a modified form of autonomy.

Autoplate, a machine for making and finishing curved stereotype printing plates for use in printing newspapers, invented by H. A. Wise Wood of New York, the first put into use upon the New York *Herald.* This machine, after a flexible papier-maché matrix, made from a type page, is inserted therein, proceeds to cast printing plates, weighing about 50 pounds each, at the rate of four a minute, and to dress their edges and inner surfaces and prepare them for attachment to the printing cylinders, and this is done automatically — all within the compass of one machine. Previous to the advent of the autoplate such work had been invariably done by hand-worked devices, with which the fastest rate of production attainable was at the rate of slightly less than one plate per minute. So great a change did this invention make in the work of stereotyping upon the larger newspapers, that not only was the machine generally adopted, but in every case the hand apparatus were entirely dispensed with, and sole dependence placed upon the autoplate.

Autran, ō-trän′, **Joseph,** French poet: b. Marseilles, June 1813; d. there, 6 March 1877. His verse is admired for its purity of form and refined sentiment. He attracted attention in 1832 with an ode to Lamartine, 'The Departure for the East.' His works include 'The Sea,' poems (1835); 'Milianah,' an epic (1842); 'Rural Life' (1856); and 'The Daughter of Æschylus,' drama (1848), which won a prize from the French Academy.

Autrefois Convict, ō′tr-fwä′ kôn-ve′, in criminal pleading, a plea made by a defendant indicted for a crime or misdemeanor, that he has formerly been tried and convicted of the same. This plea is similar in form as the plea of *autrefois acquit,* and is based upon the same general principle, to wit: that no man's life or liberty shall be twice put in jeopardy for the same offense. A plea of *autrefois convict,* which shows that the judgment on the former indictment has been reversed for error in the judgment, is not a good bar to another indictment for the same offense. But a prior conviction before a justice of the peace, and a performance of the sentence pursuant to the judgment, constitute a bar to an indictment for the same offense, although the complaint on which the judgment proceeded was so defective

that his judgment might have been reversed for error. The New York Code of Criminal Procedure, § 9, expressly prohibits a second prosecution for the same crime. At common law it is necessary, according to the weight of authority in a majority of the United States, to specially plead former conviction or acquittal. In many of the States, however, by statute, the plea of *autrefois acquit* may be taken advantage of under the plea of not guilty. The statute adopted in New York is similar in its terms to that of many other States. It is provided by the New York Code of Criminal Procedure, § 322, that a plea of former judgment of conviction or acquittal of the crime charged may be pleaded with or without the plea of not guilty.

Au'tumn, the season of the year which follows summer and precedes winter. Astronomically, it is considered to extend from the autumnal equinox, 22 September, in which the sun enters Libra, to the winter solstice, 22 December, in which he enters Capricorn. In popular speech it includes the months of September, October, and November.

Autun, ō-ten, France (ancient *Bibracte*), a town in the department of Saône et Loire, of considerable interest both from its antiquities and from its modern edifices. Of the former the more remarkable are two Roman gates of exquisite workmanship and in good preservation, the ruins of an amphitheatre and of several temples; of the latter the most conspicuous is the cathedral of St. Lazare, a Gothic structure of the 11th century. Pop. (1896) 11,873.

Autunite, a beautiful canary-yellow mineral, occurring in thin, tabular crystals of orthorhombic symmetry, but closely approaching the tetragonal mineral torbernite in form. Both of these minerals are hydrous phosphates of uranium, but while calcium is an essential constituent of autunite, whose formula is $Ca(UO_2)2P_2O_8 + 8H_2O$, it is replaced by copper in torbernite, which is further distinguished by its green color. Autunite has eminent basal cleavage, resulting in a pearly lustre on the basal plane, while on the edges of the crystal the lustre approaches adamantine. It has a hardness of 2 to 2.5 and a specific gravity of about 3.12. Some autunite is beautifully fluorescent. Its name is derived from its most noted locality, Autun, France, where it is found in closely aggregated masses of crystals. Other noteworthy occurrences are in Cornwall, England, in Saxony, North Carolina and South Dakota.

Auvergne, ōvārn'y, a province of central France, now included in the departments Cantal, Puy-de-Dôme, and Haute Loire. The mountains of Auvergne are the highest in the interior of France, the highest of them, Puy-de-Dôme, being 4,805 feet above the sea. It is entirely composed of volcanic matter, and has a regular crater 1,000 feet in circumference, and 300 feet deep. The whole of the cones present the same general character — well-defined craters enclosed by regular cones, on whose sides the lava currents may be traced as easily as on those of Vesuvius.

Auvergne, Mountains of, a branch of the Cevennes, chiefly situated in the departments of Puy-de-Dôme and Cantal (France). The most important peaks are Puy-de-Sancy (6,185 feet), Plomb du Cantal, and Puy-de-Dôme.

Auwers, Arthur, German astronomer: b. Göttingen 12 Sept. 1838. He became assistant in the observatory at Königsberg in 1859, and at Gotha in 1862; in 1866 was made a member of the Berlin Academy and astronomer to it. In his capacity of president of the Astronomical Society he was conspicuously identified with the preparation of the great co-operative catalogue of over 100,000 stars. For his services to astronomy he was made a foreign member of the Academy of Sciences at Washington, from which he also received the Watson gold medal. Among his works are 'Neue Reduktion der Bradleyschen Beobachtungen 1750–62' (1882–8), and 'Katalog von 9,789 Sternen' (1896).

Aux Cayes, ō-kā', a seaport town of Haiti, situated on the southwest coast of the island, about 85 miles west of Jacmel. It has an excellent harbor, a good export trade, and is the seat of an American consular agent. Pop. about 25,000.

Auxerre, ō-sār' (ancient *Antissiodurum*), a town in France, 96 miles southeast of Paris. It is finely situated on a height above the Yonne, which here becomes navigable, but is very poorly built. Its principal edifices are its cathedral of St. Stephen, a splendid Gothic structure, with a finely proportioned interior, and windows containing most beautiful stained glass; the church of St. Germain, with some curious crypts; and a magnificent old episcopal palace, now converted into the Hôtel de Prefecture. The manufactures consist of woolens, hats, wine casks, leather, red and yellow ochre, earthenware, and violin strings; and the trade is chiefly in wood and in the wines of the district. Of these wines the most famous is the white Chablis. Pop. (1896) 15,082.

Auxonne, ō-sŭn' (Latin *Asona* or *Aussona*), a town in France, 18 miles east-southeast of Dijon, on the left bank of the Saône, here crossed by a beautiful bridge of 23 arches. Auxonne is well built, the seat of a court of commerce, and has a communal college, and a public library containing 4,000 volumes; a castle, an arsenal, and a cannon foundry. Pop. (1896) 6,700.

Auzout, ō-zoo', **Adrian,** French mathematician: d. 1691, inventor of the micrometer, still in use among astronomers to measure the apparent diameter of celestial bodies. He was the first who thought of applying the telescope to the astronomical quadrant.

Ava, ā'va, or **Aungwa,** a town in Asia, the former capital of Ava or Birmah, on the Irrawaddy. It has a circuit of about five miles, and consists of an inner and an outer town, each surrounded by a brick wall. Pop. (1891) 39,477.

A'va, Arva, Yava, or **Kava** (*Piper methysticum*), a plant of the natural order *Piperaceæ*, possessing narcotic properties. It is a shrubby plant, with heart-shaped acuminate leaves, and very short, solitary, axillary spikes of flowers. It is a native of many of the South Sea Islands, where

the inhabitants intoxicate themselves with a fermented liquor prepared from the upper portion of the root and the base of the stem. The rhizone is thick, woody, rugged, and aromatic. The intoxicating liquor is prepared by macerating it in water. The narcotic property is ascribed to an acrid resin, *kawine*, present in the root. The taste is unpleasant to those unaccustomed to it, and has been likened to that of rhubarb and magnesia. The intoxication is not like that produced by ardent spirits, but rather a stupefaction like that caused by opium. It is succeeded by a copious perspiration. The habitual use of ava causes a whitish scurf on the skin, which, among the heathen Tahitians, was reckoned a badge of nobility, the common people not having the means of indulgence requisite to produce it. Ava is, like cocaine, a local anæsthetic.

Avadhuta, ä'va-d'-hoo'ta, a member of a mendican sect in southern India addicted to self-torture.

Av'alanche, a mass of snow or ice which slides down steep mountain slopes. On lofty mountains snow would accumulate indefinitely if the excess were not removed by sudden falls or by glaciers which bring it into the valleys, where it melts. Avalanches may occur at any season of the year, but they are most frequent in early spring after the snow has begun to melt from the sun's rays. The water which collects beneath the snow bank loosens it from the ground, and the whole mass may then be precipitated to the base of the mountain. Such avalanches occur regularly in the Alps, where they are known as *grundlawinen.* Another type (*staublawinen*) occurring in the winter season is characterized by the dry and finely divided condition of the snow, and results from the overloading of the snow-fields. A third class is the ice-avalanche, occurring along the course of glaciers. Avalanches are often very destructive, sweeping away trees, houses and everything in their path. Their destructive effects are greatly increased by the wind-blasts which accompany them. Those occurring in winter usually cause the greatest loss of life, as they develop suddenly and without warning; those that take place in spring generally follow a definite path and are more or less regular in their occurrence. The planting of forests on the high slopes sometimes affords protection from avalanches, but when this is not feasible, stone structures are employed.

Aval Islands. See BAHREIN.

Av'alon, Cal., a summer resort on Santa-Catalina Island, established for the purpose of supplying the comforts of life at a minimum cost. It is owned by a joint stock company, and was literally built to order when it was determined to build the town. The sight selected was a desert, with not a tree in sight and only a few shanties of fishermen along shore. Water was found in a neighboring cañon to the north and piped over the hills. The ground was leveled, the hollows filled, and small prominences cut down. The surveyor platted the tract, laid out streets, avenues, walks, and a central plaza or park with provision for fountains. This accomplished, the plumbers followed, and a system of sewerage and water pipes was introduced. The aid of the forester was next called into play, and the streets and avenues were planted with small Australian eucalyptus trees. A wharf was built, a hotel or restaurant, several cottages for the superintendent, a number of tents erected, and what is known as the "tent city" was finished. The tent city is a feature peculiar all along the southern California coast, for the benefit of ranchers and others from the inland cities and towns who desire to escape the heat and enjoy life at the seashore at a minimum cost.

What is known as the "tent city" is more or less peculiar to California, and the local papers, from the heart of the Sierras to the sands of the ocean, during the summer months, all contain glowing advertisements of the "tent city." Such cities, with a population of several hundred, are found at many points on the Pacific coast. The equipment of the "tent city" constitutes a business in itself. At Avalon is a large circus tent which in winter contains furniture of every description. Here, in fact, the "tent city" was in winter quarters, everything being classified and arranged with order and system. In April or May a gang of workmen descends upon the winter quarters, and like magic the vacant lots are filled, and in a day a city is reared as though by the touching of the proverbial button. Each tent is neatly and well furnished, and can be rented for a nominal cost, the owners of the island giving the ground rent and free water, each lot being sewered and perfect in its sanitary arrangement. The visitor can rent a tent for sleeping, a parlor and kitchen, or he can rent a single room. In the centre of the "tent city" is a store where every description of food, carefully prepared and cooked, can be obtained. Near by the Y. M. C. A. has opened a reading room and library.

The questions of the physical and moral welfare of such a community would seem an important and difficult one to manage, but all this and even the amusements are included in the plan, and we have a city where every door is open and where probably the jail is used hardly once in the season. On the borders of the city is a large amusement hall, and in the neighboring grove is a band stand where the finest band in southern California gives an open-air concert from 7 until 9, seats being provided for 1,200 people. No smoking is allowed within the area of the seats. At the end of the concert the band adjourns to the "pavilion," and a ball is given free to the inhabitants of the "tent city" and others. No policeman is in evidence in the town, though guardians of the peace are present in citizen's clothes. In fact, here is a summer municipality of large size, conducted by a corporation that attends to everything; keeps the town clean, provides amusement, sustains a health officer, administers justice through a justice of the peace, provides the government with a post-office, and maintains two daily boats between the island and the mainland — an experiment in government worthy the attention of the pessimist who affects to believe that communities cannot be run by machinery, as this virtually is, so well arranged and systematized are the methods. It might be assumed that a series of stringent and excessive taxes would be imposed upon each resident, but investigation shows that each resident of the tent city of Avalon pays but $2.75 per capita per season for the privileges, which is the

THE CURVING BEACH AT AVALON, SANTA CATALINA, CALIFORNIA.

cost of round trip fare from Los Angeles to the island, a distance of 50 miles, more or less. This and the rent of tent constitute the sole tax. The winter population is generally less than 1,000, but in summer 75,000 persons are to be found at times living within the corporate limits.

Av'alon, the legendary elysium of King Arthur, being his abode after disappearing from the haunts of men; called also *Avilion.* The name is also identified with Glastonbury, and has been given to a peninsula of Newfoundland.

Avalos, ä'va-lōs', the name of a noble Neapolitan family, which included Ferdinand D' Avalos, Marquis de Pescara: b. Naples, 1490; d. 1525. He served with distinction in the army of Charles V., and was taken prisoner by the French at the battle of Ravenna in 1512. He beguiled the hours of captivity by writing a 'Dialogue of Love,' which he dedicated to his wife, the beautiful and accomplished Vittoria Colonna. He soon recovered his liberty, and subsequently displayed extraordinary ability in the wars of Charles V.

Avancini, Nicholas, an ascetic writer of the Society of Jesus: b. 1612; d. 1686. His little book of meditations on the life and doctrine of Jesus Christ which has been translated into several languages and is widely used to-day by members of clergy, first appeared in Vienna in 1665. By reason of its arrangement, its scriptural sources, its pithy suggestiveness, and its practical character, Cardinal Gibbons states that it has been his Vade Mecum, his book of meditations during all the years of his ministry.

Avare, L', la-vär' (The Miser), the title of one of the most famous of Molière's prose comedies, first produced 9 Sept. 1668. It is founded on the 'Aulularia' of Plautus, and was paraphrased by Fielding in his comedy of 'The Miser.' Harpagon is a sexagenarian miser who incarnates the spirit of avarice and has determined to marry a young woman named Mariane, but ultimately prefers his gold to matrimony.

Avars, ä'värz, or **Avares,** a nation of Mongolian or Turkish origin, who at an early period migrated to the regions around the Don, the Caspian Sea, and the Volga. They served in Justinian's army, and later made themselves masters of Dalmatia, pressed into Thuringia and Italy, where they fought with the Franks and Lombards, and extended their dominion over the Slavonians dwelling on the Danube and farther north, as well as over the Bulgarians on the Black Sea. They were at length overcome by Charlemagne, and after 827 disappear from history; but the valley of Erlav, a small tributary of the Danube in Lower Austria, was called the "land of the Avars" as late as the 10th century.

The name is also borne by a tribe estimated to number upward of 100,000, now living in the Caucasus Mountains, noted for their struggle with Russia, in which they were led by Schamyl (q.v.). See also Lesghians.

Avatar, ăv'a-tär', in Hindu mythology, an incarnation of the Deity. Ten avatars are peculiarly distinguished, and four of them are the subjects of *Purânas,* or sacred poems. These 10 are among the incarnations of Vishnu, the supreme God. The Matsya avatar was the descent of the Deity in the form of a fish; Kachyapa or Kûrma, in that of a tortoise; Varâha, as a boar; Nara-sinha, as a monster, half man, half lion; Vâmana, as a dwarf; Parasurama, as the son of Jamadagni. All these took place in the *Satya Yuga,* or golden age. The seventh incarnation was in the form of the four sons of King Dasaratha, under the names of Râma, Lakshmana, Bharata, and Satrughna, in order to destroy certain demons that infested the earth. The achievements of Râma form the subject of the celebrated epic called the Râmâyana. The eighth avatar of Vishnu, in the form of Krishna, is the best known of all, from the fact that it forms the subject of the great Sanskrit epic poem, the Mahâbhârata. Its object was to relieve the earth from the Daityas, and the wicked men who oppressed it. The ninth was in the form of Buddha. The Kalki, or tenth avatar, is yet to come at the end of the *Kali Yuga,* or the iron age. See Vishnu.

Avatcha, a-vä'cha, a volcano and bay in Kamchatka. The volcano, 9,000 feet high, was last active in 1855. The town of Petropavlovsk is situated on the bay.

Ave Maria, ä'vā ma-rē'a (Latin; hail Mary, from *averre*); among the Roman Catholics the beginning of a prayer to the Virgin, whence the whole prayer is called *Ave Maria.* It is the beginning of the salutation which the angel addressed to the Virgin, as he announced to her that she should be the mother of the Saviour (Luke i. 28; "Hail, highly favored, the Lord is with thee; blessed art thou among women."). See Rosary.

Avebury, ā'bėr-ĭ, Lord. See Lubboch, Sir John.

Ave'bury, England, a village in Wiltshire, occupying the site of a so-called Druidical temple, which originally consisted of a large outer circle of 100 stones, from 15 to 17 feet high, and about 40 feet in circumference, surrounded by a broad ditch and lofty rampart, and enclosing two smaller circles. On the neighboring downs are numerous barrows or tumuli, one of which, called Silbury Hill, rises to the height of 130 feet, with a circumference of 2,027 feet at the base, covering an area of more than five acres.

Avellaneda, a-vā'lya-nā'da, Alfonso Fernandes de, the pseudonym of the writer of a sequel to 'Don Quixote,' issued prior to the sequel by Cervantes. See Don Quixote.

Avel'lane'da, Nicholas, Argentine statesman: b. Tucuman, 1 Oct. 1836; d. 26 Dec. 1885. He was professor of political economy in the University of Buenos Ayres; minister of public instruction in 1868–74, and president of the republic in 1874–86. He published several historical and economical works.

Avellaneda y Arteaga, a-vā'lya-nā'da ē är'tā-ä'ga, **Gertrudis Gomez de,** distinguished Spanish poet, dramatist and novelist: b. Puerto Principe, Cuba, 23 March 1814; d. Madrid, 2 Feb. 1873. Under the pseudonym Peregrina she contributed to Andalusian journals many 'Lyric Poems' (1851–54), and afterward wrote a series of spirited novels: 'Two Women,' 'The Baroness de Joux,' 'Dolores,' and others. She gained still higher distinction with the tragedies 'Alfonso Munio,' the hero

of which was her own ancestor, and 'The Prince of Vianna.' Her later compositions had a tone of melancholy; among these are Biblical dramas, as 'Saul' and 'Balthasar'; the spiritual song, 'At the Cross,' and 'The Last Ascent of My Harp' (1850). In the later years of her life she composed 16 plays which still have a place on the Spanish stage.

Avellino, ä'vĕl-lē'nō, a town in Italy, 29 miles east of Naples. It has a square adorned with an obelisk, and possesses several agreeable promenades. Pop. (1901) 23,700.

Ave'na. See OATS.

Avenarius, Richard, German philosopher: b. Paris 1843; d. Zürich 1896. He studied philosophy at the universities of Zürich, Berlin, and Leipsic, and from 1877 to his death was professor of philosophy at Zürich. He wrote on Spinoza's pantheism, published a theory of experience and contributed many papers to magazines and reviews, upon philosophical subjects.

Avenches, ȧ-vänsh', Switzerland, a town in the canton of Vaud, seven miles northwest of Fribourg. It is the ancient Aventicum, capital of Helvetia under Roman rule, and is noted for its Roman relics, notably the ruins of an amphitheatre, and a Corinthian column belonging to a temple of Apollo. In Roman times it was a city of 20,000 inhabitants. The population now is about 2,000.

Av'enel, Mary, a character appearing in Scott's novels, 'The Monastery' and 'The Abbot.'

Avenel, äv-nĕl', **Paul,** a French poet and novelist: b. Chaumont 9 Oct. 1823. He was active in connection with several periodicals, and besides several vaudevilles, he wrote 'The Peasant Woman from the Abruzzi' (1861), a drama; 'The King of Paris' (1860), a historical romance; 'The Calicoes' (1866), scenes of real life. Among several collections of poems may be mentioned 'Alcove and Boudoir,' interdicted in 1855 and re-published in 1885.

Aven'ger of Blood, among primitive peoples the next of kin to a murdered man, upon whom was laid the duty of avenging the crime by killing the murderer. In this custom may be detected the source of the system of criminal law.

Av'entine, the southernmost of the seven hills of Rome, on the left bank of the Tiber, between the river and the Cælian hill. The Circus Maximus lay to the northeast of the Aventine, between it and the Palatine, and the baths of Caracalla were on the southeast.

Aven'turine. See QUARTZ; SUNSTONE.

Avenzoar, ä'vĕn-zō'ăr, or more correctly, **Abu-Merwan-Mohammed - ben - Abdalmalec - ben-Zohar,** Arabian physician of the 12th century: b. Seville, Spain; d. Morocco, 1169. He became eminent in his profession, traveled much, and passed through many adventures, among which was a long imprisonment at Seville. He had the care of a hospital, and composed a work entitled 'Al Theiser,' containing a compendium of medical practice, and including many facts and observations not found in the preceding writers, which was probably the result of his own experience. The report of his having lived to the age of 135 is probably an error arising from his having been confounded with his son, of the same name and profession, who lived at Morocco, and was the author of a treatise on the regimen of health.

Av'erage, in maritime law, is general, particular or petty. General average (also called gross) consists of expense purposely incurred, sacrifice made, or damage sustained for the common safety of the vessel, freight and cargo, or the two of them, at risk, and is to be contributed for by the several interests in the proportion of their respective values exposed to the common danger, and ultimately surviving, including the amount of expense, sacrifice or damage so incurred in the contributory value. Indemnity for general average loss is ordinarily stipulated for in policies against the risks in navigation, subject, however, to divers modifications and conditions. Under maritime policies in the usual form, insurers are liable for the contributions, for loss by jettison of cargo, sacrifice of cables, anchors, sails, boats, delay for the purpose of refitting, voluntary stranding, etc. Average particular (also called partial loss) is a loss on the ship, cargo or freight, to be borne by the owner of the subject on which it happens, and is so called in distinction from general average, and, if not total, it is also called a partial loss. It is insured against in marine policies in the usual forms on ship, cargo or freight, when the action of peril is extraordinary, and the damage is not mere wear or tear, and on the ship covers loss by sails split or blown away, masts sprung, machinery of steamship disabled, planks started, change of shape by strain, loss of boat, breaking of sheathing or upper works or timbers, damage by collision or stranding, by lightning or fire, or in defense against pirates or enemies, or by hostile or piratical plunder. Petty average consists of small charges formerly assessed upon the cargo, to wit: anchorage, pilotage, beaconage, towage, quarantine, etc.

Av'erage Man, An, a society novel by Robert Grant. It is a story of manners rather than plot, concerning itself more with types than with individuals.

A'verell, William Woods, American military officer: b. Cameron, N. Y., 5 Nov. 1832; d. Bath, N. Y., 3 Feb. 1900. He was educated at West Point, and served on the frontier, and in several Indian campaigns till the beginning of the Civil War, when he was appointed colonel of the Third Pennsylvania Cavalry, and assigned to the command of the cavalry defenses of Washington. During the war he distinguished himself on numerous occasions as a cavalry raider and commander, and at its close was brevetted major-general of volunteers. He resigned from the regular army while holding the rank of captain, in 1865, and, under an act of Congress, was reappointed captain in August 1888, and was placed on the retired list in the same month. He was United States Consul-General at Montreal in 1866–9. He invented a system of asphalt pavement now quite generally adopted and the Averell insulating conduits for wires and conductors.

Avernus, ȧ-vėr'nŭs, a small circular lake, now called *Lago d'Averno*, in Naples, kingdom of Italy, between the ancient Cumæ and Puteoli. It is surrounded by hills of a moderate height, which used to be covered with immense woods,

while the atmosphere was charged with unhealthy mephitic effluvia, and occupies the crater of an extinct volcano. By ancient Greek writers, subsequent to Homer, it was fabled to be the entrance to the infernal regions, and to have been the place where Ulysses entered in his visit to the shades. It was also thought that the Cimmerians of Homer dwelt on the banks of this lake. The sibyl of Cumæ is said to have had her grotto here, and Virgil represents her as guiding Æneas when he made his descent (“*facilis descensus Averno*”) to the infernal regions at this place.

Averroes, av-er-rōs′ (corrupted from *Ebn* or *Ibn Roshd*), a renowned Arabian philosopher: b. Cordova, Spain, 1126; d. about 1198. He became a cadi or judge first in Seville and afterward in Cordova. He was accused of rejecting the established religion, and in consequence deprived of his offices, and fled to Fez. Here he was condemned by a spiritual court to recant and undergo a public penance. Upon this he went back to his own country, but was latterly restored to his dignities in Morocco. Averroes regarded Aristotle as the greatest of all philosophers, and explained his writings, with only a slight deviation from his views. Besides commentaries on Aristotle and other philosophical works he wrote also a compendium of physic, called ‘Colliget’ (a corruption of the Arabic ‘Kulliyat,’ or summary), and treatises on jurisprudence, astronomy, grammar, etc. His commentaries upon Aristotle, in a Latin translation, were repeatedly printed at Venice in the 15th and 16th centuries. His ‘Colliget’ also was early translated into Latin, and several times printed. See Renan, ‘Averroës et l’Averroisme’ (1860); Müller, ‘Philosophie und Theologie von Averroës’ (1875).

Aversa, a-vĕr′sa, a town of Italy, nine miles north of Naples, on a plain covered with vines and orange trees. It is the seat of a bishop, and is famed for a kind of almond-cake, called *torrone,* in great demand at Naples. Pop. (1901) 23,477.

A′very, Benjamin Parke, American journalist and diplomatist: b. New York 1829; d. Peking, China, 8 Nov. 1875. He went to California in 1849 and became connected with several papers on the Pacific coast, among them the San Francisco *Bulletin.* In 1872 he was appointed editor of the ‘Overland Monthly.’ From 1874 to 1875 he was United States minister to China. His chief work is ‘Californian Pictures in Prose and Verse’ (1877).

A′very, Elroy McKendree, American writer: b. Erie, Mich., 1844. He served in the Federal army during the Civil War, and has since been prominent in educational matters. Among his many published works are textbooks in physics and chemistry, ‘Words Correctly Spoken’ (1887); and ‘A Popular History of the United States,’ now in progress of publication.

Avery, Otis, American dentist: b. Bridgewater, Oneida County, N. Y., 19 Aug. 1808; d. Honesdale, Pa., 1904. He then took up the study of dentistry, and began the practice of his profession at Honesdale, Pa., where he lived for the greater part of his life. For some years he was the only dentist between Honesdale and Utica, N. Y., and at the time of his death was the oldest practising dentist in the United States.

A′very, Samuel Putnam, American merchant: b. New York, 17 March 1822; d. there 12 Aug. 1904. He became a copper-plate and wood engraver, and subsequently an art publisher and dealer. He was a founder of the Metropolitan Museum of Art; life member of the American Museum of Natural History, American Geographical Society, American Historical Society, American Zoological Society; president of the Grolier Club, and first president of the Sculpture Society. In 1891, with his wife, he created and endowed the Avery Architectural Library, in Columbia University, as a memorial of his deceased son; and in May 1900 presented to the trustees of the New York Public Library a collection of etchings, lithographs, and photographs, numbering more than 17,500 pieces, together with a number of large volumes illustrated by the same arts.

A′very, Waitstill, American lawyer: b. Norwich, Ct.; d. North Carolina, 1821. He practised his profession successfully; was appointed in 1777 attorney-general of North Carolina, and was at the time of his death the patriarch of the bar of that State. He was prominent in the political affairs of the State, being a member of the State congress prior to the Revolution, and of the State legislature after the establishment of peace. In 1777 he was appointed one of a commission to treat with the Cherokee Indians.

A′very's Gores, the name of several tracts of land in Vermont, granted to Samuel Avery in 1791. One of them is in Addison County, nearly on the summit of the Green Mountains, now forming a part of Granville.

Aves, ā′vās, or **Bird Islands,** a group of small islands belonging to Venezuela, valuable for their deposits of guano.

Aves, ā′vēz, the class of vertebrated animals which contains the birds. They have been defined by Dr. Gadow as “oviparous, warm-blooded, amniotic vertebrates, which have their anterior extremities transformed into wings.” The metacarpus and fingers carry feathers or quills; there is an intertarsal joint, and the feet have not more than four toes, of which the first is the hallux. See Birds.

Aves′ta, or **Zend-Avesta,** the Bible of Zoroaster, the sacred book of ancient Iran, and holy scripture of the modern Parsis. The exact meaning of the name “Avesta” is not certain; it may perhaps signify “law,” “text,” or, more doubtfully, “wisdom,” “revelation.” The modern familiar designation of the book as Zend-Avesta is not strictly accurate; if used at all, it should rather be Avesta-Zend, like “Bible and Commentary,” as *zand* signifies “explanation,” “commentary,” and *Avesta u Zand* is employed in some Persian allusions to the Zoroastrian scriptures as a designation denoting the text of the Avesta accompanied by the Pahlavi version or interpretation. The story of the recovery of the Avesta, or rather the discovery of the Avesta, by the enthusiastic young French scholar, Anquetil du Perron, who was the first to open to the western world the ancient records of Zoroastrianism, reads almost like a romance. Du Perron's own account of his departure for India in 1754, of his experiences with the *dasturs* (or priests) during a seven years' residence among them, of his various

difficulties and annoyances, setbacks, and successes, is entertainingly presented in the introductory volume of his work 'Zend-Avesta, Ouvrage de Zoroastre' (1771). This was the first translation of the ancient Persian books published in a European language. Its appearance formed one of those epochs which are marked by an addition to the literary, religious, or philosophical wealth of our time; a new contribution was added to the riches of the West from the treasures of the East. The field thus thrown open, although worked imperfectly at first, has yielded abundant harvests to the hands of later gleaners. With the growth of knowledge of the language of the sacred texts, we have now a clear idea also of the history of Zoroastrian literature, and of the changes and chances through which with varying fortunes the scriptures have passed. The original Zoroastrian Avesta, according to tradition, was in itself a literature of vast dimensions. Pliny, in his 'Natural History,' speaks of two million verses of Zoroaster; to which may be added the Persian assertion that the original copy of the scriptures was written upon twelve thousand parchments, with gold illuminated letters, and was deposited in the library at Persepolis. But what was the fate of this archetype? Parsi tradition has an answer. Alexander the Great,—"the accursed Iskander," as he is called,—is responsible for its destruction. At the request of the beautiful Thais, as the story goes, he allowed the palace of Persepolis to be burned, and the precious treasure perished in the flames. Whatever view we may take of the different sides of this story, one thing cannot be denied: the invasion of Alexander and the subjugation of Iran was indirectly or directly the cause of a certain religious decadence which followed upon the disruption of the Persian empire, and was answerable for the fact that a great part of the scriptures was forgotten or fell into disuse. Persian tradition lays at the doors of the Greeks the loss of another copy of the original ancient texts, but does not explain in what manner this happened; nor has it any account to give of copies of the prophet's works which Semitic writers say were translated into nearly a dozen different languages. One of these versions was perhaps Greek, for it is generally acknowledged that in the 4th century B.C. the philosopher Theopompus spent much time in giving in his own tongue the contents of the sacred Magian books.

Tradition is unanimous on one point at least: it is that the original Avesta comprised 21 *Nasks,* or books, a statement which there is no good reason to doubt. The same tradition which was acquainted with the general character of those Nasks professes also to tell exactly how many of them survived the inroad of Alexander; for although the sacred text itself was destroyed, its contents were lost only in part, the priests preserving large portions of the precious scriptures. These met with many vicissitudes in the five centuries that intervened between the conquest of Alexander and the great restoration of Zoroastrianism in the 3d century of our era, under the Sassanian dynasty. At this period all obtainable Zoroastrian scriptures were collected, the compilation was codified, and a detailed notice made of the contents of each of the original Nasks compared with the portions then surviving. The original Avesta was, it would appear, a sort of encyclopædic work; not of religion alone, but of useful knowledge relating to law, to the arts, science, the professions, and to every-day life. If we may judge from the existing table of contents of these Nasks, the zealous Sassanians, even in the time of the collecting (226–380 A.D.), were able to restore but a fragment of the archetype, perhaps a fourth part of the original Avesta. Nor was this remnant destined to escape misfortune. The Mohammedan invasion, in the 7th century of our era, added a final and crushing blow. Much of the religion that might otherwise have been handed down to us, despite "the accursed Iskander's" conquest, now perished through the sword and the Koran. Its loss, we must remember, is in part compensated by the Pahlavi religious literature of Sassanian days.

Fragmentary and disjointed as are the remnants of the Avesta, we are fortunate in possessing even this moiety of the Bible of Zoroaster, whose compass is about one tenth that of our own sacred book. A grouping of the existing texts is here presented: (1) Yasna (including Gathas); (2) Visperad; (3) Yashts; (4) Minor Texts; (5) Vendidad; (6) Fragments.

Even these texts no single manuscript in our time contains complete. The present collection is made by combining various Avestan codexes. In spite of the great antiquity of the literature, all the existing manuscripts are comparatively young. None is older than the 13th century of our own era, while the direct history of only one or two can be followed back to about the 10th century. This mere external circumstance has of course no bearing on the actual early age of the Zoroastrian scriptures. It must be kept in mind that Zoroaster lived at least six centuries before the birth of Christ.

Among the six divisions of our present Avesta, the Yasna, Visperad, and Vendidad are closely connected. They are employed in the daily ritual, and they are also accompanied by a version or interpretation in the Pahlavi language, which serves at the same time as a sort of commentary. The three divisions are often found combined into a sort of prayer-book, called Vendidad-Sadah (Vendidad Pure); that is, Avesta text without the Pahlavi rendering. The chapters in this case are arranged with special reference to liturgical usage.

Some idea of the character of the Avesta as it now exists may be derived from the following sketch of its contents and from the illustrative selections presented:

1. *Yasna* (sacrifice, worship), the chief liturgical work of the sacred canon. It consists mainly of ascriptions of praise and of prayer, and corresponds nearly to our idea of a prayer-book. The Yasna comprises 72 chapters; these fall into three nearly equal parts.

The greater part of the Yasna book is of a liturgic or ritualistic nature, and need not here be further described. Special mention, however, must be made of the middle section made up by "the Five Gathas" (hymns, psalms), a division containing the 17 sacred psalms, sayings, sermons, or teachings of Zoroaster himself. These Gathas form the oldest part of the entire canon of the Avesta. In them the prophet of the new faith is speaking with the fervor of the Psalmist of the Bible. In them we feel

the thrill of ardor that characterizes a new and struggling religious band; we are warned by the burning zeal of the preacher of a Church militant. Now, however, comes a cry of despondency, a moment of faint-heartedness at the present triumph of evil, at the success of the wicked and the misery of the righteous; but this gives way to a clarion burst of hopefulness, the trumpet note of a prophet filled with the promise of ultimate victory, the triumph of good over evil. The end of the world cannot be far away; the final overthrow of Ahriman (Anra Mainyu) by Ormazd (Ahura Mazda) is assured; the establishment of a new order of things is certain; at the founding of this "kingdom" the resurrection of the dead will take place and the life eternal will be entered upon.

The *Visperad* (all the masters) is a short collection of prosaic invocations and laudations of sacred things. Its 24 sections form a supplement to the Yasna. Whatever interest this diversion of the Avesta possesses lies entirely on the side of the ritual, and not in the field of literature. In this respect it differs widely from the book of the Yashts, which is next to be mentioned.

Yashts (praises of worship) form a poetical book of 21 hymns, in which the angels of the religion, "the worshipful ones" (*Yazatas, Izads*), are glorified, and the heroes of former days. Much of the material of the Yashts is evidently drawn from pre-Zoroastrian sagas which have been remodeled and adopted, worked over, and modified, and incorporated into the canon of the new-founded religion. There is a mythological and legendary atmosphere about the Yashts, and Firdausi's 'Shah Nameh' serves to throw light on many of the events portrayed in them, or allusions that would otherwise be obscure. All the longer Yashts are in verse, and some of them have poetic merit. There are several translations of the Avesta. The best (except for the Gathas, where the translation is weak) is the French version by Darmesteter, 'Le Zend Avesta,' published in the 'Annales du Musée Guimet'. An English rendering by Darmesteter and Mills is contained in the 'Sacred Books of the East,' Vols. IV., XXIII., XXXI.

Aveyron, ạ'vā-rôñ', a department in the south of France. It is extremely mountainous, and is traversed by five considerable rivers, the Aveyron, after which the department is named, the Viaur, the Truyère, the Lot, and the Tarn. Of these, the only one navigable within the department is the Lot. It is only in the west that plains of any considerable extent are found. Agriculture is in a very defective state, but considerable attention is paid to sheep-breeding. Cheese of an excellent quality is made and exported in large quantities. Aveyron possesses valuable coal, iron, and copper mines, besides other minerals. Pop. (1901) 377,559.

A'viary, a house or enclosure, larger than an ordinary cage, for living birds. Out-of-door aviaries are common in the warm countries of southeastern Europe and in Asia, and are also quite numerous in England. The freedom of motion possible for a bird in a good-sized aviary helps to keep them in good condition, and many species which are unable to bear the close confinement of a cage flourish in the larger enclosures. In a climate like that of the United States, where the extremes of temperature are great, outdoor aviaries are uncommon except in zoological gardens. In the New York Zoological Park is an aviary built in 1900, measuring 153 feet long, 72 feet wide, and 55 feet high; at present this is the largest in the world. It is a wire cage, in the shape of a pointed arch, supported by steel frames. It stands among trees, and several are enclosed by it. Game birds, herons, and other large species live in this aviary, and many smaller species, which would suffer out of doors in winter, dwell there during the summer months. See Cage-Birds.

Avicebron, ä-ve'thā-brōn', **Solomon ben Jehuda ibn Gabriol,** Hebrew poet and philosopher: b. Cordova, about 1028; d. about 1058. Of his poetical works, 'The Royal Crown' is the most famous; of the philosophical, 'The Fountain of Life,' written in Arabic, but known only through a Latin translation (re-edited in Münster, in 1895).

Av'icen'na, Arabian philosopher and physician: b. near Bokhara, 980 A.D.; d. 1037. He completed his studies at the early age of 18, and began to practise as a physician. He settled subsequently at Hamadan, at first as physician to a noble lady, afterward as vizier of the emir. On the death of his patron his son and successor refused to recognize him as vizier, and accordingly he lived in retirement at Hamadan. Going in later life to Ispahan, he passed in quietness the last 14 years of his life, and composed the greater part of his works on medicine, logic, metaphysics, astronomy, and geometry. Avicenna left many writings, mostly commentaries on Aristotle. Of his medical works, the principal is called 'Canon of Medicine,' founded on the Greek writers, and in some parts of the East is still an authority. It has been printed in the original Arabic, and there have been many Latin translations of it. His other works have also appeared in translations.

Av'icen'nia, or **White Mangrove,** a genus of *Verbenaceæ,* consists of trees or large shrubs resembling mangroves, and, like them, growing in tidal estuaries and salt marshes. Their creeping roots, often standing six feet above the mud in crowded pyramidal masses, and the naked asparagus-like suckers which they throw up, have a singular appearance. The bark of *A. tomentosa,* the white mangrove of Brazil, is much used for tanning. A green, resinous substance exuding from *A. resinifera* is eaten by the New Zealanders. The genus is named in memory of the Arabian physician, Avicenna (q.v.).

Avie'nus, Rufus Festus, Latin descriptive poet, who flourished about the end of the 4th century after Christ, and wrote 'Descriptio Orbis Terræ,' a general description of the earth; 'Ora Maritima,' an account of the Mediterranean coasts, etc.

Avignon, ạ've-nyôñ' (ancient *Avenio*), a French city, capital of the department Vaucluse, on the left bank of the Rhone. It consists generally of large antique houses, in narrow, crooked, dirty streets. The principal objects of interest are the large and very ancient cathedral; the papal palace, with lofty massive walls and strong towers, and the chamber of the Inquisition. The silk manufacture is the

principal source of employment at Avignon, and the rearing of silkworms is carried on extensively in the district. The city has also manufactories of velvet, woolen, and other goods, hats, jewelry, etc., with silk dye-works, paper-mills, tanneries, etc., and a trade in wine, brandy, iron, cotton, wool, grain, and other articles, of which it is the entrepôt for Lower Dauphiné, Provence, and all Languedoc. Here Petrarch lived several years; here he saw his Laura, who formed the subject of his most beautiful verses, and whose tomb is still to be found in the Franciscan Church. The fountain of Vaucluse is five leagues from Avignon. It belonged to the papal see from 1348 to 1791, and from March 1309 to September 1376 seven Popes in succession, from Clemens V. to Gregory XI., were compelled to reside in this city. The Catholic historians commonly call this period the Babylonish captivity of the Popes. Pop. about 45,000.

Avila, ä'vẹ-la, **Gil Gonzalez d',** Spanish antiquary and biographer: b. 1577; d. 1658. He was made historiographer of Castile in 1612, and of the Indies in 1641. Most valuable works: 'Teatro de las Grandezas de Madrid' (1623); and 'Teatro Ecclesiastico' (1645–53).

A'vila, Juan de, celebrated Spanish preacher, commonly called the "Apostle of Andalusia"; b. Almodavar del Campo, 1500; d. at Montilla 1569. His missionary labors in Andalusia were prosecuted with singular success, until he arrived at the age of 50, when, with a worn-out constitution, he was obliged to desist. His 'Spiritual Letters' have been translated into most European languages.

Avila y Zuniga, ä'vẹ-lā ẹ thoo'nyẹ-ga, **Don Luis d',** Spanish general, diplomatist, and historian; a favorite of Charles V.: b. about 1490; d. after 1552. His chief work, translated into five or six languages, was on the war of Charles V. in Germany.

A'vila, a town of Spain, the capital of the province of Avila, a modern division of Old Castile. It is the see of the bishop suffragan of Santiago, with a fine cathedral, and was once one of the richest towns of Spain. A university founded here in 1482 by Ferdinand and Isabella continued its existence until the beginning of the 19th century. Saint Theresa and several men celebrated in Spanish history were born here. Principal employment in the town is spinning; in the province, breeding sheep and cattle. Pop. about 12,000.

Av'ison, Oliver R., English physician: b. Yorkshire, 30 June 1860. He removed to Canada in youth, and became professor of materia medica, instructor of microscopy and demonstrator of materia medica in the University of Toronto. In 1893 he went to Korea as a medical missionary; the same year he was appointed to the charge of the Royal Korean Hospital, and in the following year became physician to the royal family.

Avi'tus, Marcus Mæcilius, an emperor of the West. He belonged to a Gaulish family in Auvergne, and gained the favor of Constantius, the colleague of Honorious, and of Theodoric, king of the Visigoths. He served with distinction under Ætius, became Prefect of Gaul, and concluded a favorable treaty with the Goths. He afterward retired into private life until the invasion of Attila, when he induced the Goths to join the Romans against the common enemy. Avitus was proclaimed emperor in 455, took for his colleague Marcianus, and died the year following.

Avitus, Saint, bishop of Vienna from 490 until his death in 523. He was the leading champion of his day in the conflict with Arianism and Semi-Pelagianism. A signal victory in a public disputation gained for him the esteem and confidence of King Gundobald, whose son Sigismund he received into the Catholic Church and who was afterward canonized as a saint. His writings have given him a prominent place in early Burgundian-Roman literature. His chief work is a didactic poem in five books, entitled 'De Spiritalis Historiæ Gestis,' and deals with such subjects as the origin of the world, original sin, etc. Another poem in praise of chastity, while inferior in literary merit to the work just mentioned, contains much of value from a historical standpoint.

Aviz, ä'vesh, **Order of,** a Portuguese order of knighthood, created in 1147 by Alphonso I. The knights were then called Knights of Evora, but took their present title, in 1287, from their gallant defense of the fortress of Aviz against the Moors. The order was changed from an ecclesiastical to a civil institution in 1789. The king of Portugal is grand master.

Avlona, ạv-lō'na, a seaport in Albania, protected by the island of Sasseno, the ancient Saso. It is one of the stations of the Austrian Lloyd steamers, and carries on considerable trade with Brindisi, etc. The Christian inhabitants, chiefly Italians, are engaged in commerce, exporting oil, wool, salt, pitch, and especially some 40,000 tortoise shells yearly. The Turks are employed in the manufacture of weapons and woolen fabrics. Valonia, a material exported to England for tanning, is the pericarp of an acorn grown nearby. Up to 1691 the town belonged to the Venetians. Pop. 6,000.

Avocado (ăv'ō-kā'dō) **Pear,** a tropical fruit. See ALLIGATOR PEAR.

Av'ocet, a shore-bird of the limicoline genus *Recurvirostra,* remarkable for its very slender beak, which curves upward toward the end like a cobbler's awl. It is a near relative of the stilt sandpiper, and various species occur throughout the world. The North American species, *Recurvirostra americana* is found in summer throughout the temperate parts of the country, migrating to the tropics in winter. It is about 17 inches in length, brownish-black above and white below, with the head, neck, and chest light cinnamon. Its general habits are those of sandpipers.

Avoirdupois, ăv'ẹr-dū-poiz' (French *avoir du poids,* to have weight), a system of weights and measures in which a pound contains 7,000 grains or 16 ounces, while a pound troy contains 1,760 grains or 12 ounces. All larger and coarser commodities are weighed by avoirdupois weight. The avoirdupois ounce is less than the troy ounce in proportion of 72 to 79.

Avon, ā'vọn, the name of several rivers in England, the most important of which are the following: (1) The Upper Avon, rising in Leicestershire, runs southwest, and falls into the Severn at Tewkesbury. Stratford-on-Avon,

a town on this river, is the birthplace of Shakespeare; (2) the Lower Avon, which rises near Tetbury, in Gloucestershire, and falls into the Severn northwest of Bristol, being navigable as far as Bath; (3) in Monmouthshire; (4) in Wiltshire and Hampshire, enters the English Channel at Christchurch Bay, in the latter county.

A'vondale, a parish of Scotland, in the county of Lanark. At the battle of Drumclog, fought near this place 1 June 1679, Grahame of Claverhouse, the famous Viscount Dundee, was defeated by the forces of the Scottish Covenant. A graphic description of this battle is found in Sir Walter Scott's 'Old Mortality.'

Avranches, ạ-vränsh' (ancient *Abrincæ*), a town in France, about 3 miles from the Atlantic, and 30 miles east of St. Malo. It is pleasantly situated at the end of a long ride, the summit of which was crowned by a magnificent cathedral; built in the 11th century, and destroyed at the revolution. In this cathedral Henry II. did penance before two of the Pope's legates for the murder of Thomas à Becket. One of its bishops was the celebrated Huet, author of the 'Demonstratio Evangelica.' The manufactures are chiefly lace, white thread, and wax candles, and there is some trade in agricultural produce. Pop. (1896) 7,600.

Avul'sion (Latin, *avulsion,* a tearing off), a term denoting the sudden transfer by natural causes of a portion of one man's land to that of another, as when the course of a river is suddenly changed and former boundaries altered. It differs from accretion, which describes a gradual addition to the property of a riparian owner by the action of the water. See ALLUVION.

Awaji, ạ-wä'jẹ, one of the islands of Japan, situated between the main island and Sikokee. Its area is 218 square miles. Pop. 170,000.

Award' is the judgment or decision of arbitrators or referees, on a matter submitted to them. The award should be consonant with and follow the submission, to be binding. It must be final and certain. It must be possible to be performed, and must not direct anything illegal to be done. At common law an award could be oral or written, but in some of the States an award to be valid must be in writing. The New York Code Civil Procedure provides that an award to be valid must be in writing. See ARBITRATION AND AWARD.

Awata (ạ-wä'tạ) **Ware,** a yellow faience called "egg-ware" by the Japanese, manufactured in the village of Awata, a suburb of Kioto, and largely purchased in the United States.

Awe, â, a narrow Scottish lake in Argyleshire, about 28 miles long, and communicating by the Awe with Loch Etive. It is of great depth, has sloping and well-cultivated shores, terminated by ranges of lofty mountains, among which that of Ben Cruachan, rising to a height of 3,670 feet, at its northern extremity, is most conspicuous. A number of islets are scattered over its surface, and on two of them are some beautiful ruins.

Axayacat, ăx'ạ-yạ-kạt, or **Axayacatl,** a Mexican fly, the eggs of which, deposited abundantly on rushes and flags, are collected and sold as a species of *caviare.* The use of these as an article of diet was learned by the Spanish settlers from their predecessors, the native Indian Mexicans, who called the dish *ahuauhti.*

Axayacatl, ä'chạ-yạ-kä't'l, a Mexican emperor: d. about 1477. He was the father of Montezuma, whom Cortez conquered, and reigned 14 years. He was already famous as a warrior when he became emperor of the Aztecs, and inaugurated his reign by a successful expedition against Tehauntepec, and in 1467, conquered anew the cities of Cotasta and Tochtepec. A little later he repelled the tribes who strove to get possession of the Mexican capital, and maintained a vigorous warfare against his neighbors. The palace of Axayacatl, a gigantic pile of stone buildings, became the barracks of the Spaniards. His treasures were discovered by Cortez, within a concealed door, and the chronicler of the conquest exclaims that "it seemed as if all the riches in the world were in that room." They consisted of gold and silver in bars and in the ore, many jewels of value, and numerous rich and beautiful articles of curious workmanship, as imitations of birds, insects, or flowers.

Axe (apparently an original Aryan word), a long-handled tool for wood-cutting. Its essential feature is the helve, though a certain shape is imposed by the nature of its service. The chipped flint of the oldest Stone Age was a tool of all work, to crush, dig, or cut (rather, bruise off), as occasion demanded, and was too heavy and shapeless to be used except by hand. As soon as one was shaped and sharpened to admit of tying a handle to it for a heavier stroke, the axe came into being, and was probably the earliest implement thus differentiated. So natural a device was separately invented by each race early in its history, and made of the material at hand: flint in England and America; whinstone or granite in Ireland, and by the lake dwellers of the Continent; bone by the American Indians and Eskimos; while stone axes are still used by some of the South Sea Islanders. In all these cases and until the use of metal, the handle was secured with a thong, as piercing with an eye was impracticable. The first copper and bronze "celts" were made in the same way. But when casting had become familiar, it was seen that there was no difficulty in casting a hole to thrust the handle in, making a much surer and heavier stroke; and with this "eye" the modern axe appeared. The bronze axe was lightened and better shaped, and in its turn displaced by iron, for which with the progress of invention has been substituted an iron butt inset with a steel cutting part. The old hand forges have for some generations been replaced by immense establishments with developed machinery. The American process consists of cutting the butt from a piece of white-hot iron, punching the eye, then reheating and shaping it by pressure between concave dies; again heating, cutting in the edge a groove, into which the arched steel edge-piece is set, then welding the two and drawing out the axe to a proper edge by trip-hammers at a white heat. The next process is hammering off the implement by a combination of hand and machine work, and restoring the shape lost in drawing out. It is then ground to symmetry, hung on a revolving table in a furnace, and heated over a small

coal fire, at a peculiar red heat, determined by the eye; cooled in brine and then in fresh water, and removed to another furnace, where it receives the last temper. It is next polished to a finish that shows every flaw, and enables it to resist rust and enter wood easily; then stamped, the head painted to prevent rust, weighed, labeled, and packed for sale. The leading axe establishment of the world is the Collins Company, of Collinsville, Conn., whose processes are largely special inventions for the company. It manufactures 5,000 axes and other edge tools daily, besides other miscellaneous goods; and consumes annually 3,500 tons of iron and 1,200 of steel, and 10,000 tons of coal. Nearly 700 men are employed; 13 water-wheels and four steam engines supply the motive power.

Ax'el, or **Absalon,** Danish prelate, archbishop of Lund: b. near Soroë, Zealand, 1128; d. 1201. His family name was Axel. In 1157 he was chosen bishop of Roeskilde or Rothschild. In that age warlike pursuits were not deemed inconsistent with the clerical office, and Absalon was a renowned warrior by sea and land, as well as a zealous ecclesiastic, his avowed principle being that "both swords, the spiritual and the temporal, were intrusted to the clergy." To his exertions as statesman and soldier Waldemar was largely indebted for the independence and consolidation of his kingdom.

Ax'elsen, a powerful Danish family who flourished in the latter half of the 15th century, and the members of which figured in the wars of Christian I. and John IV. of Denmark, and Karl Knutsen and Eric the Pomeranian, kings of Sweden. Peter Axelsen was the head of the family. Of his nine sons, the eldest, Olaf, made himself master of Gothland; the second, Iver, retained that possession, and became a corsair; the third, Eric, was governor of Stockholm; and the fourth Aage, became a Danish councilor of state.

Axholme, an island in Lincolnshire, England, formed by the rivers Trent, Don, Idle, and Vicardyke. Epworth, the home of the Wesleys, is the principal parish. Its area is 47,000 acres. The soil is exceedingly fertile.

Ax'il, in botany, the angle between the upper side of a leaf and the stem or branch from which it grows. Buds usually grow out from the stem in axils of leaves, and this position is naturally termed axillary. In anatomical terminology, the axilla is the armpit.

Axim, ą-shēng', or ăx'ĭm, an important station and port on the African Gold Coast, near the mouth of the Ancobrah River. Inland from Axim, in the basin of that river, and in the district between it and the Prah, gold-mining operations have been carried on on a large scale. It was ceded to the English by the Dutch in 1872.

Ax'inite (Greek, "like an axe"), a mineral usually occurring in broad, acute-edged triclinic crystals, suggestive, in shape, of an axe. It has a glassy lustre, brown or yellow in color, and is translucent and strongly pleochroic. It has a hardness of 6.5 to 7, and a specific gravity of about 3.28. Its exact composition is still doubtful, but it may be described as a calcium and aluminum borosilicate, containing also varying amounts of manganese and iron. Its most important occurrences are in Dauphiné, France, Mount Skopi, Switzerland, in Japan and at Franklin Furnace, N. J.

Axin'oman'cy, a mode of divination much practised by the ancient Greeks, particularly with the view of discovering the perpetrators of great crimes. An axe poised upon a stake was supposed to move so as to indicate the guilty person; or the names of suspected persons being pronounced, the motion of the axe at a particular name was accepted as a sign of guilt. Another method of axinomancy was by watching the movements of an agate placed upon a red-hot axe.

Ax'iom (an assumption), a universal proposition, which the understanding must perceive to be true as soon as it perceives the meaning of the words, though it cannot be proved. It is, therefore, called a self-evident truth. In mathematics, axioms are those propositions which are assumed without proof, as being in themselves independent of proof, and which are made the basis of all the subsequent reasoning. Euclid has assumed 15 axioms as the basis of geometry. Among these are: "The whole is greater than its part"; "Things that are equal to the same thing are equal to one another"; "Magnitudes which coincide, that is, which exactly fill the same space, are equal to one another in every respect." Bacon calls axiom a general principle, obtained by experiment and observation, from which we may safely proceed to reason in all other instances; and Newton gives the name of axiom to the laws of motion, which, of course, are ascertained by the investigation of nature; he also terms axioms those general experimental truths or facts which form the groundwork of the science of optics.

Ax'is (in crystallography). See Crystal.

Ax'is (Latin, of unknown origin), a white-spotted deer (*Axis axis*) of India and the East Indies, known locally among the Hindus as "chitra," among the English as the "hog-deer." It resembles the European fallow deer in size and color, and as it is easily domesticated, is a favorite in European parks. The slender, sharp-pointed horns are not palmated and only a little branched, while the female is hornless. It is timid and usually goes in small herds, in which females largely predominate. It lives in thick jungles near water, and usually feeds in the night. Colored plates, illustrating its varieties, are given in Lydekker's 'Deer of All Lands' (1898).

Ax'minster, a market town in Devonshire, England, 24 miles east of Exeter, on the side of a hill that rises above the River Axe. The only public building worthy of notice is the parish church, a very ancient edifice, containing some interesting antique monuments. Axminster was at one time celebrated for its woolen cloth, and carpet manufactures, and gave name to a special make of carpet having a thick, soft pile. Brushes are now made here, and there are flour and other mills. Pop. (1901) 4,100.

Axolotl, ăx'ō-lŏtl (Mex., "play in the water"), a larval salamander regarded as edible. They are numerous in the lakes about the City of Mexico, are 6 to 10 inches long, and are prepared by either roasting or boiling, and eaten with vinegar or cayenne pepper. The

most extraordinary thing about them, however, is the fact that they are the young of a species of terrestrial salamander (*Amblystoma tigrinum*), well known over all the warmer parts of the United States and Mexico, which in these lakes never transform into adults, but remain permanently in the larval condition, yet become sexually mature when about six months old, so that they are able to breed. This astonishing fact was long unknown. The axolotl has bushy, external gills similar to those which permanently characterize the mud-puppy. It was regarded as a distinct animal, and named *Siredon lichenoides*. The discovery of the truth was made accidentally in Paris in 1865, when some axolotls in an aquarium in the Jardin des Plantes lost their gills and were transformed into perfected amblystomas. A lady, studying in the University of Freiburg, Frl. Marie von Chauvin, then undertook a series of careful experiments with other captives, and worked out the complete history of metamorphosis, which is dependent (at least in Europe) on a very narrow set of favorable circumstances, but differs in no essential degree from that of other salamanders (q.v.). Why the change never takes place in the Mexican lakes is unexplained. The theories in regard to it, and the detailed history of the observations above mentioned, are given by Gadow in 'Amphibia and Reptiles' (1901), with many references to other books and periodicals.

Ax'on, that part of the nerve cell that carries the nervous impulses, the axis cylinder process, or the nerve fibre proper. See Nerve Cell; Nerve Fibre.

Axum, ax-oom', a town in Abyssinia, once the capital of a powerful kingdom, and at one time the great depot of the ivory trade in the Red Sea. The importance of this city and its kings was first made known to us by a stone (*Axumitic marble*) with a Greek inscription, first explained by Salt, who discovered it, and afterward by Buttmann and Niebuhr. The interest in this inscription was increased by the explanation which it afforded of the second half of the Adulian marble. Axum, the place where it was found, still exhibits many remains of its former greatness. Among its ruins are shown the royal throne, and groups of obelisks, originally 55 in number, one of which Salt declared to be the most beautiful that he had seen. Pop. 5,000. See Bent, 'The Sacred City of the Ethiopians' (1893).

Ayacucho, ä'ya-koo'chō, the name of a department of Peru and also of its capital. The department has an area of about 24,000 square miles, and is traversed by both chains of the Cordilleras and watered by numerous rivers. It produces coffee, sugar, cotton, etc. The capital, situated on the main road from Lima to Cuzco, has a cathedral and a university. It was founded by Pizarro in 1539, and long known as Huamanga. A battle took place here, one of the most celebrated in the history of South America, having been decisive of the independence of upper and lower Peru. See Ayacucho, Battle of. Pop. of town 22,000.

Ayacucho, The Battle of, a decisive engagement in the South American struggle for liberty; was fought on 9 Dec. 1824, at and near the Peruvian town of that name. On the one side was the Spanish viceroy of Peru with nearly all that remained of the Spanish power in its last stronghold upon the continent; on the other Gen. Sucre, second in command to Bolivar (the latter not being present), with Colombian troops, and Peruvians led by Gen. Lamar. The viceroy was taken prisoner; the utter defeat of his army made possible the independence of Bolivia (realized the following year), and strengthened the republican governments in all the neighboring states.

Ayala, a-yä'la, **Adelardo Lopez de,** a Spanish dramatist: b. Gaudalcanal, Badajoz, March 1820; d. 30 Dec. 1879. After studying law in Seville, he went to Madrid, where he devoted himself entirely to poetry and speedily won national fame. His first drama, 'A Statesman' (1851), met with immediate success, and was followed in the same year by 'The Two Noblemen,' and 'Penalty and Pardon.' To the modern comedy of manners, his specific domain, he first contributed 'The Glass Roof,' and in 1861 attained to wide reputation with 'Percentage.' Of his other works the most noteworthy are 'The Modern Don Juan' (1863); and 'Consuelo' (1878), a drama.

Aya'la, Lopez de, Spanish historian and poet: b. 1332; d. 1407. He was a prominent statesman and warrior during the reigns of the Castilian kings Pedro the Cruel, Henry II., John I., and Henry III., and is known as the author of a 'Chronicle of the Kings of Castille' (his contemporaries), in which the crimes of Pedro the Cruel are detailed and drawn in colors said to be sometimes overcharged.

Ayamonte, ä'ya-mōn'tā, a seaport town in Spain, near the mouth of the Guadiana, which here forms the boundary between Spain and Portugal.

Aycock, Charles Brantley, American politician: b. Mahunta, now Fremont, Wayne County, N. C., 1 Nov. 1859. He was educated at the University of North Carolina, studied law and began the practice of his profession at Goldsboro, N. C., in 1881. In 1893 he was appointed United States district attorney for the eastern district, and in 1900 was elected governor of North Carolina by a majority which was the largest ever given to a gubernatorial candidate in that State.

Aye-Aye, äï'äï' (native Malagasy name; from its cry), a lemur (*Daubentonia madagascarensis*), about the size of a rabbit, and with teeth like a bat. It is small and brownish, with a long bushy tail. Arborial and nocturnal in habit, it lives in bamboo jungles feeding on vegetables and the larvæ of certain borers. Its feet, as well as its hands, have opposable thumbs, and exceedingly long, naked, flexible-fingers armed with pointed nails, suitable for extracting grubs out of deep crevices.

Ayeen, ä-yēn', or **Akbery,** a valuable statistical description of the Mogul empire as it was in the reign of Akbar. It was compiled by Abul Fazi, the vizier of the Emperor Akbar. There is an English translation of it by Gladwin.

Ayesha, a-yĕ'shä, the daughter of Abu-Bekr, the favorite wife of Mohammed: b. 610 or 611; d. 677 or 678. After Mohammed's death she opposed the succession of Ali, raised an army against him, and was taken prisoner, but dismissed with that spirit of chivalry which had already arisen among the Arabians.

Aylesbury, ālz'bĕr-ĭ, a market town in Buckinghamshire, England, 38 miles northwest of London, in the centre of the fertile valley of Aylesbury. There are many old houses, irregularly but picturesquely built. The parish church of St. Mary is a fine early English edifice, and there are various other places of worship; a county-hall, market-house, clock tower, and corn exchange. There are also baths, a large county hospital, and the only convict prison for women in England. The chief industries are printing, making condensed milk, and poultry-raising for the London market, Aylesbury ducks being widely known, and there are several breweries and flour-mills. Pop. (1901) 9,244.

Ayles'bury Duck. See DUCKS.

Aylesford, ālz'fĕrd, a town in Kent, England, three miles from Maidstone. In its vicinity is the remarkable monument called Kit's Coty House, a kind of Druidical cromlech.

Ayllon, ī-lyōn, **Lucas Vasquez de,** Spanish adventurer: b. about 1475; d. 1526, who, in 1509, occupied the position of counsel at the supreme court of St. Domingo, and was subsequently employed by Fernando Cortes, on a mission to Velasquez. In 1520, he joined an expedition to Florida, treacherously captured a great number of natives, and proposed to found a new colony, but was unsuccessful, and is supposed to have lost his life while engaged in a second expedition to Florida.

Aylmer, āl'mĕr, **John,** English prelate: b. Norfolk 1521; d. 1594. He was tutor to Lady Jane Grey. On the accession of Mary, he was forced to leave his country, but when Queen Elizabeth came to the throne he returned to England; and in 1576 was made bishop of London.

Ayl'mer, Matthew, Canadian military officer: b. Melbourne, P. Q., 28 March 1842. He entered the British army in 1864; retired from the imperial service and entered the Canadian volunteer militia in 1870; and became adjutant-general of the Dominion militia, the highest military office in Canada next to that of the major-general commanding, in 1896.

Ayl'mer-Gowing, Emilia, English poet and reciter: b. Bath, October 1846. She was educated partly in Brighton, partly in Paris, where she received the attention of Lamartine. After a short career on the stage she successfully produced two dramas, 'A Life Race,' and 'A Crown for Love.' Her 'Ballads and Poems,' and 'The Cithern' have become popular, as well as two novels, 'The Jewel Reputation,' and 'An Unruly Spirit.' In 1891 she published 'Ballads of the Tower and Other Poems.'

Ayl'mer, Lake. (1) A Canadian lake, lying 80 miles north of Great Slave Lake on the margin of the forest area. (2) A Canadian lake in Quebec, about 70 miles south of the city of Quebec.

Ay'loffe, ā'lŏf, **Sir Joseph,** an English antiquary: b. about 1708; d. 1781. He was one of the first council of the Society of Antiquaries, a commissioner for the preservation of state papers, and author and editor of several works, of which the best known is his 'Calendars of the Auntient Charters,' etc.

Aymaras, ī'mą-räz', an Indian race of Bolivia and Peru, speaking a language akin to the Quichua. They are physically characterized by great chest development, caused by the rarefied air of the region they inhabit.

Aymon, ā'mŏn, the surname of four brothers, called respectively Alard, Richard, Guiscard, and Renaud, sons of Aymon or Haimon, Count of Oordogne, who figure among the most illustrious heroes of the chivalric poetry of the Middle Ages; but their historic existence must be considered problematical. Their career furnished rich material to the romantic narratives of Italy in the 15th and 16th centuries. A novel, entitled 'The Four Aymon Brothers,' by Huon de Villeneuve, a French poet of the age of Philip Augustus, details very minutely their exploits, and Ariosto conferred a poetical immortality on the family by the publication of his 'Roland,' in which Renaud, the bravest of the four brothers, plays continually the most distinguished part.

Ay'oubites, or **Ayyubites,** the Saracenic dynasty founded by Saladin, which in Egypt supplanted the Fatimite caliphs, about 1171 A.D. Several of the descendants of Saladin, known as Ayoubites, afterward ruled in Egypt, Syria, Armenia, and Arabia Felix. In the 13th century their power was destroyed by the Mamelukes.

Ayr, ār, a town in Scotland, on the river Ayr, and 34 miles south-southwest of Glasgow. The principal streets of modern Ayr are spacious and well paved, and many of the buildings handsome. The most important edifices are several churches of the various denominations; the town-hall and connected offices, in great part completed in 1881, surmounted by a fine spire of older date, 226 feet high; the county buildings; the academy, a celebrated educational institute, the buildings of which are handsome and commodious; the Wallace tower, 115 feet high on the site of a more ancient tower; the free library; the railway station and hotel; a hospital; etc. There is a handsome esplanade along the sea front 1,500 yards long. Two bridges connect Ayr with Newton and Wallacetown, incorporated in the burgh. One of these, opened in 1879, occupies the place of the "New Brig" of Burns' 'Brigs of Ayr,' the "Auld Brig" (built 1252) being still serviceable for foot traffic. There is now also a third bridge farther up the river, besides the railway bridge. Ayr exports manufactured goods, iron, coal, whetstones, etc.; and imports iron-ore, grain, timber, slates, bricks, etc. The harbor lies within the mouth of the river, and is enclosed and protected by a north and a south pier and a breakwater; there being also a wet dock and a slip dock. Shipbuilding is carried on, also tanning, boot and shoe making, the manufacture of carpets, lace curtains, etc. The poet Burns, as is well known, was born in a house which stands within one and one half miles of the town, between it and the church of Alloway ("Alloway's auld haunted kirk"), and a monument has been erected to his memory on a height between the church and the bridge over the Doon. Pop. (1901) 28,624.

Ayr, a river of Ayrshire, Scotland, which after a course westward of 18 miles, finally loses itself in the Frith of Clyde below the town of Ayr.

Ayrer, ī'rẽr, **Jacob,** German dramatist: b. Nuremberg about 1560; d. there, 26 March 1605. Between 1595 and 1605 he wrote more than 100 plays, of which the 'Opus Theatricum' (Nuremberg 1618) contains 30 tragedies and comedies, and 36 Shrovetide plays and vaudevilles. In his dramas the influence of the English stage is apparent.

Ayres, ārz, **Alfred.** See OSMUN, THOMAS ERMBLEY.

Ayres, Anne, American author: b. England, 1816; d. February 1896. She was the first member of an American sisterhood in the Protestant Episcopal Church. She wrote 'Evangelical Sisterhood' (1867); and 'Life of Augustus Muhlenberg.'

Ayres, Romeyn Beck, American soldier: b. East Creek, N. Y., 20 Dec. 1825; d. New York 4 Dec. 1888. He served in the Federal army during the Civil War, and at its close was brevetted brigadier-general and major-general in the volunteer and regular service.

Ayr'shire, an extensive maritime county of Scotland, about 60 miles in length, with a breadth varying from 10 to 26 miles. Its coast line is about 75 miles in length, has several excellent harbors. The singular rock off the coast, known by the name of Ailsa Craig, belongs to the county, as also do one or two other islets. The surface has no great elevations, the highest summits varying from about 1,200 to 1,900 feet. The principal streams are the Ayr, Stinchar, Girvan, Doon, Irvine, and Garnock.

The mineral riches are very considerable. Coal is abundant, especially in the middle and northern parts of the county, and there are over 100 collieries. Extensive seams also of blackband ironstone exist, and are now being actively worked, Ayrshire having become the great seat of the iron manufactures of Scotland next to Lanarkshire. Plumbago is found in some localities; and lead, antimony, and copper are also met with. Limestone and freestone abound. Millstones, of coarse granite, much esteemed for their hardness and durability, are quarried near the north coast, in the district of Cunningham.

The native sheep are bred in great numbers; their wool is coarse and scanty, but the flesh is excellent. The horses of Ayrshire are of superior breed, being hardy, strong, and of large size. The woolen manufactures are extensive, particularly carpets, bonnets, and worsted shawls, which are produced in great quantities. On the coast is the ancient castle of Turnberry, in which Robert Bruce, king of Scotland, is said to have been born, and where he is known to have spent many of his youthful years. It was here that a fire, accidentally kindled, was mistaken by Bruce for an appointed signal, and caused him to cross the sea from the island of Arran opposite to attempt the deliverance of his country. Of the ecclesiastical ruins the most interesting is the abbey of Crossragruel, founded in 1244. The chief towns are Ayr, Kilmarnock, Irvine, Troon, Saltcoats, Largs, and Ardrossan. Pop. (1901) 254,436.

Ayrton, ār-tŏn, **William Edward,** English electrician and inventor: b. London 1847. He entered the Indian telegraph service, having studied electrical engineering with Prof. William Thomson; became electrical superintendent and introduced throughout India the system of determining the position of a fault by electrically testing one end of a line. In 1873–9 he was professor of natural philosophy and telegraphy at the Imperial College of Engineering in Japan; in 1879 became professor of applied physics in London Technical College, and, in 1884, chief professor of physics at the Central Institute, South Kensington. He was elected president of the Institute of Electrical Engineering in 1892. With Prof. Perry, he invented the ammeter, voltmeter, electric power meter, ohmmeter, and dispersion-photometer; and, with Profs. Jenkin and Perry, the system of telpherage. He has been a voluminous writer and is widely known for his 'Practical Electricity.'

Aytoun, ā'toon, **Sir Robert,** Scottish poet: b. 1570; d. London, March 1630, and studied at St. Andrews. He addressed an elegant panegyric in Latin verse to King James on his accession to the crown of England, which had, no doubt, some influence in securing to the author the favor of that monarch. He was at a later period of his life honored with the appointment of secretary to Henrietta Maria, queen of Charles I. During his residence abroad, as well as at the court of England, he lived in intimacy with, and secured the esteem of, the most eminent persons of his time. The poems of Sir Robert Aytoun, for the first time published together in the Miscellany of the Bannatyne Club, are few in number, but are distinguished by their elegance of diction. Several of his Latin poems are preserved in the work called 'Delitiæ Poetarum Scotorum' (1637).

Ay'toun, William Edmondstoune, Scottish poet and prose writer: b. Edinburgh, 1813; d. Blackhills, Elgin, 4 Aug. 1865. He studied at the University of Edinburgh, and passed as advocate in 1840. His first independent work was the 'Life and Times of Richard I.' (1840). In 1848 he published a collection of ballads entitled 'Lays of the Scottish Cavaliers,' which has continued to be the most popular of all his works, and has passed through numerous editions. It was followed in 1854 by 'Firmilian, a Spasmodic Tragedy'; in 1856 by the poem of 'Bothwell'; and in subsequent years by the novel called 'Norman Sinclair,' and various other original works. In 1858 he issued a critical and annotated edition of the 'Ballads of Scotland.' The translation of the poems and ballads of Goethe which he undertook in conjunction with Theodore Martin was less successful than some of his other works. In 1845 he was appointed professor of rhetoric and English literature in the University of Edinburgh — a position which he held till his death. In 1854 he became editor of 'Blackwood's Magazine.'

Ayuntamiento, ą-yoon'tą-myān'tō, the name given in Spain to municipal councils. Firmly established during the struggles with the Moors, the ayuntamientos acquired great influence and political power, the nobility being admitted to them without their class privileges. The Cortes, in 1812, adopted the leading features of the former system. On the return of Ferdinand VII., the ayuntamientos were abolished, but restored in 1837. The ayuntamientos were empowered to make up the lists of electors and jurors, to organize the national guards, to command the police within their own bounds, to direct the apportionment and raising of taxes, and

to manage the funds of the commune. The municipal law of 1870 deprived them of all political authority, and regulated them as administrative bodies, subject in certain respects to the authorities of the provinces, the law courts, and the Cortes.

Aza'lea, a genus of about 25 species of shrubs of the natural order *Ericaceæ,* natives of the northern hemisphere, principally of eastern Asia and North America. By some botanists the genus is united with rhododendron (q.v.), as may be seen below. The species have deciduous or evergreen leaves and showy, often fragrant flowers, usually in terminal umbel-like racemes. They are commonly divided into two groups: the Indian azaleas and the hardy deciduous azaleas, including the Ghent hybrid forms. The Indian azaleas, mostly imported from Holland and forced in greenhouses, are propagated by grafts or cuttings, rarely by seeds. They are planted in loose, moderately fertile soil; sheltered from the sun and watered freely during the summer; repotted in early autumn; and, by special attention, brought into flower as desired from late autumn until early summer. The leading species of the group is *A. indica* (*R. indicum*), of which two varieties, *amœna* and *kœmoferi* are fairly hardy as far north as New Jersey. The members of the hardy group need some protection in the north and in exposed situations to prevent injury to the flower-buds due to sudden variations of temperature. Named varieties are usually propagated by grafts or by cuttings. Seedlings are often grown for their own merits, but are generally used for stocks upon which to graft choicer varieties. The following are among the best known species of this group: *A. vaseyi* (*R. vaseyi*), an excellent North Carolina species with spotted flowers which appear in early May; *A. nudiflora* (*R. nudiflorum*) pinxter-flower, found from Canada to the Gulf of Mexico, has pink, white, or sometimes purple flowers in mid-spring; *A. calendulacea* (*R. calendulaceum*), found from Pennsylvania to Georgia, has large orange- or flame-colored, particularly handsome blossoms in late spring; *A. occidentalis* (*R. occidentale*), a California species, bears fragrant, white, pinkish flowers in early summer; *A. arborescens* (*R. arborescens*), found in the Alleghany Mountains, has fragrant white or pink flowers in June; *A. viscosa* (*R. viscosum*), clammy azalea or white swamp honeysuckle, is found in swamps from maritime Canada to Florida and westward to Arkansas, and bears fragrant white or pink flowers in June or July. Among the Asiatic members of this group the best known are probably: *A. mollis* (*R. molle*); *A. rhombica* (*R. rhombicum*); and *A. pontica* (*R. ponticum*). Consult: Halliday, ‹Treatise on the Propagation and Cultivation of Azalea Indica›; Van Geert, ‹Iconographie des Azalées›; Bailey and Miller, ‹Cyclopedia of American Horticulture.›

Azari'as, Brother (Patrick Francis Mullany), b. 29 June 1847, near Killenaule, County of Tipperary, Ireland; d. 20 Aug. 1893, Plattsburgh, N. Y. (Cliff Haven). His father emigrated to the United States in 1851, leaving Patrick, his eldest son, in Ireland a few years on account of his health. Deerfield, N. Y., a place near Utica, was the new home, where he attended the public school and later the Christian Brothers' academy in Utica. At the early age of fourteen he decided to become a Brother, and on June 29, 1862, Patrick Francis Mullany received the black habit and white collar of a Christian Brother, and henceforth became known to the world as Brother Azarias. At the age of seventeen he was put in charge of a large class; and at the age of nineteen he was professor of mathematics in Rock Hill College, near Baltimore, Md. Ten years later, he was made head of the college. His first book, ‹An Essay Contributing to a Philosophy of Literature› (1874), won him the respect of scholars. His philosophical articles on literature, published in various magazines, were well received, and he was soon in demand as a lecturer before educational bodies, Catholic and non-Catholic. When in the 80's he went to Europe, he found friends everywhere; scholars who had read his books, men like Cardinal Newman greeted him as a friend. He was a promoter of the Catholic Summer School of America, and of several other educational movements. After finishing his course of lectures at the Catholic Summer School at Cliff Haven, 1893, he was too ill to go home or to any of the other meetings where he was expected. His last days were spent in «Blue Point Hotel,» near the Summer School grounds. His published works are: ‹Aristotle and the Christian Church›; ‹Books and Reading›; ‹Culture of Spiritual Sense›; ‹Development of English Literature›; ‹Development of Old English Thought›; ‹Essays Educational›; ‹Essays Miscellaneous›; ‹Essays Philosophical›; ‹Mary, Queen of May›; ‹Mary, Queen of May and Essays›; ‹Phases of Thought and Criticism›; ‹Philosophy of Literature›; ‹Psychological Aspects of Education.›

Azeglio, ad-zā'lyō, **Massimo Taparelli, Marquis d',** Italian author, artist, diplomatist, and statesman: b. Turin, 1801; d. 16 Jan. 1866. In 1816 he accompanied his father to Rome, and there occupied his time principally with painting and music. He was already favorably known as a painter, when, in 1830, he went to Milan, married the daughter of Manzoni, the great novelist, and wrote several romances. The earliest of these, ‹Ettore Fieramosca,› was received with great enthusiasm. His next romance, ‹Niccolò de Lapi,› became equally popular, and is esteemed by Italian critics the best historical novel in any language. Deeply imbued with the spirit of Italian nationality, in 1842 Azeglio made a tour through the provinces of Italy, awakening the revolutionary spirit which troubled the last years of Gregory XVI. After the revolution of 1848 he supported the cause of the king of Piedmont, and, at the head of the papal troops, fought against the Austrians at Vicenza, where he was wounded. In 1849 Victor Emmanuel appointed him president of the cabinet of ministers, an office which he resigned in 1852 to his political adversary, Count Cavour. In 1859, after the peace of Villafranca, he undertook a confidential mission as ambassador extraordinary to England; and was afterward appointed governor of the city of Milan.

Az'imuth, in astronomy, the arc of the horizon comprehended between the meridian of the observer and the vertical circle passing through the star. It is easterly if the star is

observed before, westerly if after, and zero if at the time of culmination. It is usual to connect with the quadrant a graduated, horizontal circle, called the *azimuth circle.*

Azio, Greece, a village on the gulf of Arta, in the district and promontory of the same name. A German archæologist, Dr. Erlinger, succeeded, in 1857, after several years' investigation, in ascertaining the position of the camps of Antony and Augustus, precisely as it was on the eve of the battle of Actium. He found the camp of the latter surrounded by a cincture of redoubts about 5½ miles in extent, which were constructed in stone, and protected by a ditch. In advance of the camp were external works, consisting of several small forts of observation, one of them serving as a telegraph for communicating with the fleet. In the ruins of one of these forts was discovered a tablet in steel, on which signals are traced, resembling somewhat those of the aërial telegraphs.

Azkar Tuarik, an African tribe of the Tuariks, who inhabit the desert country between Ghat on the north and the tracts of the Kelowi Tuariks on the south, between lat. 21° and 26° N. They were first visited and made known to the European world by the British central African expedition of Barth, Overweg, and Richardson. The country in the north is a barren plain, with scarcely any vegetation, and with isolated granite peaks, and few or no animals. The southern portion, bordering on the Kelowi Tuariks, is the uninhabited central region of the great desert. The inhabitants of Azkar, like the rest of the Tuariks, belong to the Berber and not to the negro race. They are fanatical Mohammedans in religion, hating both Pagan and Christian. They are monogamists. They are a warlike aristocracy, divided into 5 *tiyusi,* or clans, and subdivided into 30 divisions or *fayas,* each of which has a separate chief.

Azmari, the name applied to a set of vagrant beggars in Abyssinia, part of whom form the music bands of the Abyssinian army, while the rest exercise their musical voices in the street, especially on religious holidays.

Azo, or **Azzo,** or **Azzolinus, Portius,** an Italian lawyer, d. in 1200. He professed jurisprudence at Bologna with such éclat that the college could not contain all his auditors, so that he had to take to the public square.

Azoben'zene. See BENZENE.

Az'o Colors. See COAL TAR COLORS.

Azo'ic, the name given to the earliest geological period, before the appearance of life on the earth. It includes the oldest rocks, mostly granites, gneisses, and schists, in which there are no traces of organic remains. The term is practically synonymous with Archæan.

Azores, or **Western Islands,** a Portuguese archipelago, in the mid-Atlantic, between lat. 36° 55′ and 39° 55′ N. and between lon. 25° 10′ and 31° 16′ W. Stretching over a distance of 400 miles, their nine islands are divided into three distinct groups — Sta Maria and Saõ Miguel in the southeast; Terceira, Saõ Jorge, Pico, Graciosa, and Fayal in the middle; and Flores and Corvo in the northwest. Of these, Flores lies 1,176 miles west of Cape Rocca in Portugal, 1,484 miles southwest of Falmouth, and 1,708 miles east-southeast of Halifax. In 1431–53 the Azores were taken possession of by the Portuguese. They were at that time uninhabited; but that they had been visited by the Carthaginians is proved by Punic coins found on Corvo. They seem to have been known to the Arabian geographer Edrisi in the 12th century; and they are marked distinctly on a map of 1351. The Portuguese colonists called the whole group Azores, from *acor* or *azor,* a hawk; and they named two individual islands, Corvo and Saõ Jorge, from Corvi Marini and San Zorze, which, according to a map of 1375, had been previously seen in the western ocean. In 1466 Alfonso V. made a life grant of the island of Fayal to his aunt, the duchess of Burgundy, and from this circumstance many settlers migrated thither from Flanders.

The total area of the group is 919 square miles, and the population (1890) 255,594. The area, population, and the maximum altitude of the different islands are as follows: Sta Maria (38 square miles; 5,880; 1,889 feet); Saõ Miguel (299 square miles; 107,000; 3,854 feet); Terceira (164 square miles; 45,391; 3,435 feet); Graciosa (24 square miles; 8,718); Saõ Jorge (91 square miles; 18,000); Pico (173 square miles; 27,904; 7,613 feet); Fayal (69 square miles; 26,264); Flores (54 square miles; 10,700; 3,087 feet); Corvo (7 square miles; 1,000). The capital is Angra, in Terceira; but Ponta Delgada, in Saõ Miguel, is a larger town. The Azores are of volcanic origin, and with the exception of Corvo, Flores, and Graciosa, are still liable to eruptions and violent earthquakes, the worst of 21 shocks since 1444 having been those of 1591, 1638, 1719, and 1841. Hot mineral springs are numerous; and the baths of Furnas, in Saõ Miguel, are much resorted to by invalids. The coast is generally steep and rugged; the interior abounds in ravines and mountains. Perhaps the greatest want of the group is a good harbor. The Azores are regarded as a province, not a colony, of Portugal, and as belonging to Europe.

Az'ote, a name formerly given to nitrogen; hence substances containing nitrogen and forming a part of the structure of plants and animals are known as azotized bodies. Such are albumen, fibrine, casein, gelatine, urea, kreatine, etc.

Az'otine, a substance procured by decomposing wool by the action of steam at 150° C. under a pressure of five atmospheres; the product, afterward dried by evaporation, contains nitrogen completely soluble in water. Azotine is mixed with dried blood for a fertilizer.

Azov, ä-zōf′, a town in the south of Russia, on the Don, seven miles from its mouth. The sand and mud deposited by the river have choked up the port, so that its trade and shipping have dwindled away, and the inhabitants depend mostly on fish-curing. Azov was built nine miles from the site of the ancient Greek colony of Tanaïs; and when, in the 13th century, it was taken possession of by the Genoese, they altered its name to Tana. They were driven out of it by Timur (Tamerlane) in 1392. In 1471 it was taken by the Turks, and in 1696 by Peter the Great; and it was finally ceded to Russia in 1774. Pop. (1897) 27,500.

Azov′, Sea of (ancient *Palus Mœotis*), an arm of the Black Sea, with which it is united by the Straits of Kertch. Its length, southwest to northeast, is about 168, its breadth about

80 miles; greatest depth, near its north side, not more than 8 fathoms. The western part, called the Putrid Sea, bordering on the Crimea, is separated from the main expanse by a long sandy belt, called Arabat, along which a military road has been formed. The sea teems with fish. Of the islands it contains, Benesch, the largest, has an area of 65 square miles.

Azpeitia, ath-pā'e-tya, a town in Spain, 18 miles southwest of San Sebastian. A mile from it is the famous convent of Loyola, now converted into a museum and built by the Roman architect, Fontana, in 1683. It includes the tower of the Santa Casa, in which St. Ignatius of Loyola, the founder of the Society of Jesus, was born in 1491. Here every year in July a great festival is held in his honor, to which pilgrims flock from all quarters. Pop. about 7,000.

Azrael, ăz'rā-ĕl, in Mohammedan mythology, the angel of death.

Az'rek, the principal stream of Abyssinia, which, after a winding course through Abyssinia and Sennaar, falls into the Nile above Gerri.

Az'tec Club, an organization formed to preserve the memories of the war in Mexico, established in Mexico in 1847.

Az'tec Confederacy. The name Aztecs (properly Aztecas) is currently used for all the Nahua (q.v.) tribes in Mexico at the time of the Spanish conquest. It belongs at most only to the seven more closely cognate tribes which occupied the valley of Mexico, and is by some restricted to the one tribe which built Tenochtitlan, or Mexico City, and is so used for convenience here. The name is from the unidentified place (generally assumed as northward) whence they came, Aztlan, variously interpreted as "heron place," "heron-clan place," "white place," and "seacoast"; the best opinion makes it Jalisco or Michoacan, on the west coast of Mexico. Apparently some time from the 9th to the 11th century they invaded the plateau of Anahuac ("waterside," lake district), where tribes of the same stock were already living, and took possession of several commanding points; the chief pueblo being that of the Aztecs or Toltecs at Tollan (now Tula), some 40 miles north of Mexico City, a leading pass from the north into the valley of Mexico. Driven from this by the warfare of the other natives the Aztecs moved south into the valley, and established themselves in the salt marshes where the outlet of lakes Chalco and Xochimilico flows into Lake Tezcuco, amid which in 1325 (the first absolutely sure date in their history) they built Tenochtitlan, now the city of Mexico. They converted it by dikes and causeways into an island, and gradually made it another Venice, a stone town intersected with canals, the strongest position in Mexico. For more than a century, however, they were tributary to the great pueblo of Azcaputzalco, near them on the western shore of the lake. Gradually they formed a stable military organization and more stable civil society; in 1375 they elected their first "chief of men," war chief and priest in one — Acamapichtli, often styled in books "the founder of the Mexican empire"; and under the fourth chief, Izcoatzin, allied themselves with Tezcuco on the eastern lake shore. The two destroyed Azcaputzalco about 1430 and deported the surviving inhabitants to Tlacopan, near Mexico, which was made tributary to the latter. Tenochtitlan, Tezcuco, and Tlacopan then formed a league (the Aztec Confederacy, formerly termed the "Aztec empire"), purely for plunder and tribute, not at all for government or incorporation. The tribute was not only of food and similar supplies, a certain amount of land being cultivated for the benefit of the confederacy, but what was still more coveted, human victims for their gods, to be afterward eaten by themselves; sometimes of warriors for raids on others. The spoil was divided into five parts, Tenochtitlan and Tezcuco each taking two and Tlacopan one. In its less than a century of life, this league made some 30 pueblo towns tributary, principally to the east toward the gulf and southeast toward the Isthmus of Tehuantepec — a range of 8,000 or 10,000 square miles out of the 750,000 in the present Mexico. Even this was in no sense a military occupation of the country, much less the foundation of a state. Within a few dozen miles were great independent pueblos such as Cholula and Tlascala, the latter a strong and warlike settlement of some 30,000 people, who waged war to the knife with the Aztec confederacy, defeated their plundering assaults again and again, and aided other pueblos in resistance. Montezuma (q.v.), who acceded 1502, was heavily defeated by them and by the towns in Michoacan, but won success on the gulf coast; and when the Spaniards came, the southern Mexican peninsula was a mass of seething savage hatreds and feuds, no two tribes of the natives having any community of feeling or interest that could prompt them to unite with one another rather than with the foreigner. See Cortes; Mexico; Montezuma.

The Aztec tribe was divided into 20 clans or *calpullis,* each clan occupying several contiguous communal houses, each of which held several hundred persons; besides a clan office building where assemblies were held and strangers entertained. It was governed by an elected council, with a civil and a military head as in Rome, the latter being also constable. Each clan had its special rites, priests, and temple. It was divided into four phratries, each having among other duties that of exacting compensation for murders, and each ward had its own precinct, constituting four wards or quarters of the town, its arsenal, and its captain. These captains were called "darthouseman," "man-slasher," "bloodshedder," and "chief of the eagle and cactus," the latter being chief executioner, and not eligible for the chieftainship of the tribe. The supreme government of the Aztecs was by a council of 20, one from each clan, who must not be a sachem, but a member of the clan council; he was called the "speaker," and the tribal council the "speech-place" (parliament, literally). It met every 10 days at least, and oftener if called together. Once in 80 days there was a special session attended by all the leading clan and phratry officials and priests, to reconsider unpopular decisions. The tribe, too, had a dual executive, civil and religious: a sachem who was civil magistrate and chief judge; and a war chief called "chief of men," and also some priestly functions, though there was a high priest also.

He was originally chief only of the Aztecs; but about 1430 (probably on occasion of the destruction of Azcaputzalco), was made chief of the confederate army. He was elected by the tribal council and the clan war chiefs and leading priests, and could be deposed by them. His official residence was in the tribal office. From the time of the first chief, Acamapichtli, the office remained in a single family, like the old Aryan kingship.

The social and religious organization was a peculiar mixture of the lowest barbarism and the beginnings of civilization. There was no private property in land or dwellings; each man could keep a garden plot for his use, but it was his no longer than he used it. Family life had emerged from savage promiscuity: descent was reckoned in the male line, marital infidelity was punished, and remaining unmarried was not permitted except by special dispensation,— contumacy being punished by being made an outcast, a serf if a man and a prostitute if a woman. Slavery had thus begun in a small way; but the habitual use of prisoners of war as slaves had not, it being preferable to sacrifice and eat them. Agriculture was still primitive; but irrigation was practised to some extent, and horticulture was beginning to develop. The roads were only narrow trails; but they facilitated collection of tribute, and served military and trading purposes as well. The houses were generally of adobe brick, but many of the great pueblos were of stone, so that the towns looked like castellated cities. There were tessellated marble floors, finely worked and colored tapestries, and beautiful feather-work, vases, goblets, and censers of fine marbles and precious metals exquisitely wrought. There were regular weekly markets, which, though trade was by barter, indicated a large development of personal property and of superfluity above subsistence. There were elaborate pleasure-grounds, menageries, and aviaries, baths and fountains, and pleasure performances of dramas and singers, acrobats and jugglers. Yet the people were cannibals, and their religion was of the most hideous character, albeit with regularly organized priesthood and temples and altars. On one side the society touched the South Sea Islands, on the other it almost rose to ancient Egypt and was above Homeric Greece.

Az'tec Treasure-House, The, a romance by Thomas A. Janvier. It purports to be a narration of the thrilling adventures of a certain Prof. Thomas Palgrave, Ph.D.; an archæologist who goes to Mexico to discover, if possible, remains of the early Aztec civilization.

Azuay, ä-thoo-ī', a province of Ecuador, with an area of about 11,150 square miles. The cinchona tree is found here in abundance. Pop. (1890) 132,400.

Azulai, ä'zoo-lī, **Hayim David,** 18th century Jewish bibliographer: b. Jerusalem. His life was mainly spent at Leghorn. Of his numerous works, the best known is 'Shem-ha-Gedôlîm' (the names of the great), a bibliography containing the names of over 1,300 Jewish authors and more than 2,200 of their works.

Azuni, äd-zoo'ne, **Domenico Alberto,** Italian jurist: b. Sassari, Sardinia, 1749; d. 23 Jan. 1827. He became judge of the tribunal of commerce at Nice, and in 1795 published a work in which he endeavored to reduce maritime laws to fixed principles, and which appeared in French in 1805, under the title of 'Droit Maritime de l'Europe.' Napoleon appointed him one of the commissioners for compiling the new commercial code.

Az'ure, the heraldic term for the color **blue,** represented in engraving by horizontal lines.

Az'urine, a European cockroach, blue in color.

Azurite, one of the commonest ores of copper, a basic copper carbonate, having the formula $2CuCO_3.Cu(OH)_2$. Its hardness is 3.5 to 4 and specific gravity about 3.8. It is a mineral of rare beauty, its usual color being a rich Prussian to azure blue, from which fact its name is derived. Its color is, however, often so dark as to appear nearly black, this frequently being true of its crystallized forms. These are very varied and complex, and belong to the monoclinic system. They are often transparent and have a most brilliant vitreous to adamantine lustre, and are beautifully striated, while their frequent association with bright green malachite adds much to the beauty of the specimens. These two minerals sometimes occur in stalactitic forms, the one encircling the other. Such specimens have been extensively cut and polished in cross sections and worked up for various ornamental purposes. The finest material of this kind comes from Morenci, Arizona, this locality also yielding exceptionally fine crystallized specimens rivaling those from its other most celebrated localities, Bisbee, Ariz., and Chessy, France. Its occurrence at the latter locality, which has been famous for many years, has led to the frequent use of the name «chessylite» for azurite, especially in Europe. Many other localities yield choice specimens, the copper mines of the western portion of the United States being especially celebrated. In New Mexico curious pseudomorphs of native copper after azurite «balls» occur in large numbers, while pseudomorphs of malachite after azurite are very common.

Az'ymites (Lat. *azymus,* unleavened), a term applied by the Eastern to the Western Church because the latter used unleavened bread in the administration of the Eucharist. In the Western Church the point has never been regarded as of vital importance. The matter was considered at the Council of Florence (1439). The Western Church, called the Greek schismatics Prozymites.

Azzarkal, az'ar-käl', Arabian mathematician and astronomer: b. Cordova in the first half of the 11th century. He was royal astronomer of Al-Mamoun, king of Toledo. He invented divers instruments for making observations, constructed a water-clock of extraordinary dimensions, as well as a planisphere and an astrolabe, upon new principles.

Azzubeydi, a'zoo-bī'dē, **Mohammed Ibn el Hasan,** Arabian lexicographer: b. Seville, 927; d. 982. He was cadi of Seville and preceptor of Hischeam, son and heir of the Sultan. He wrote an abridgment of the great biography of the Spanish grammarians, by Khalil; a treatise on grammar, and a work upon the character of the syntax of the Arabic language.

B

B the second character in our alphabet, holds the same relative place in the alphabet of all European languages except the Russian and two or three others, as Servian and Bulgarian: in these alphabets the symbol B holds the third place, yet it stands not for our mute B but for a labial (not denti-labial) V or W; while in the second place stands a modified form of B with the same phonetic value as our B. The Russian alphabet is derived from the scheme of the monk Cyril, one of the first evangelists of Bulgaria, who translated into the language of the Sclavonians parts of the Bible. To do this it was necessary to contrive new characters for designation of sounds alien to the Greek language, and to modify existing Greek characters. But as in his time,—the 9th century,—and at a much earlier date, the current phonetic value of B was, as it still is, labial V, Cyril retained the symbol B as representing that V sound, while for the mute labial B he devised the symbol Б. With this exception the character B has from immemorial time held the second place in the alphabets of all the Aryan languages of Europe, as well as in Hebrew and Aramaic, Phœnician, Arabic, and Coptic. The most ancient form of this symbol, both in Greek and Latin, was 𐌑 with two angular loops, which were afterward rounded. The most ancient form of the symbol B among the Phœnicians was not unlike the Arabic figure 9, namely, 𐤁. The Greeks not only added a second loop but they reversed the position of the loop by setting it on the right of the upright stem; and they similarly transposed the loop of the Phœnician sign 𐤓 which they made P (rho, our R). The difference between the two labials B and P is that P is an absolute mute, in pronouncing which the voice is completely obstructed before the lips are drawn apart, while B is sonant, though the lips be still compressed: in the effort to pronounce B the voice is heard even before the lips are parted; but in pronouncing P no sound is heard while the lips are compressed; and when they are opened there is emission of breath but no voice. B and P substitute each other in words common to two or more languages and in transmutations of words within one language. Examples: Latin pila is English and German ball. Bretzel is commonly pronounced pretzel; but it is of the same origin as the English word bracelet, from Latin brachiale, an armlet, bracelet; and bretzel means also handcuffs. B is nearly allied also to F, Th, V, and W; thus beech (German buche) is represented in Greek by phegos and in Latin by fagus; whale is from the same source as Greek phalaina and Latin balaena; habere in Latin becomes in French avoir; caballus, Latin, is French cheval; German liebe, English love; Latin labium, French lèvre. V and B are little discriminated in Spanish and we have in one of the epigrams of Martial proof that in his day natives of Vasconia (Navarre) pronounced B as V and *vice versa* when he wittingly scores the bibulous habits of that people by saying that for them not without reason vivere (to live) is bibere (to drink): so that one of that nature might say vivimus ut bibamus, and the meaning would be either, we live to drink or we drink to live. In the Roman catacombs in sepulchral inscriptions of the 2d and 3d centuries of our era, vixit (lived), is in very many instances written bixit; and the name of a virgin martyr of that age is written Bibiana, and that form is retained in the Roman martyrology instead of the correct form Viviana.

B. A. C., the abbreviation used by astronomers in referring to 'The Catalogue of Stars of the British Association for the Advancement of Science,' by Francis Baily, London, 1845.

Baader, bä'dėr, **Benedict Franz, Xaver von,** German physician and philosopher: b. Munich, 1765; d. 1841. He studied engineering, became superintendent of mines, and was ennobled for his services. He was deeply interested in the religious speculations of Eckhart, St. Martin, and Böhme, and in 1826 was appointed professor of philosophy and speculative theology in the University of Munich. The main purpose of his life as revealed in his lectures, books, and correspondence, seems to have been a reconstruction of society along ethical religious lines, not entirely in harmony with conventional ideas. To the allied princes he addressed a memorial in 1814 upon the necessity of a closer union between politics and religion.

Baal, bā'ăl, a Semitic word denoting lord or ruler, and used to designate the Supreme Deity, by the Phœnicians and Chaldæans, and most of the Oriental nations, in the time of the Exodus. Baal seems to have been the sun-deity and was the same as Bel or Belus of the Babylonians and Assyrians, whose language was cognate to the Syriac and Phœnician. Collateral with these, may be placed the Osiris and Isis of Egypt, and the Gad and Meni, so frequently mentioned in the Scriptures, whom the Jews worshipped in the days of Jeremiah, having incorporated them into their own cultus from that of the Phœnicians or the Carthaginians.

The Scriptures give us an account of the facility with which the Jews embraced, and the tenacity with which they retained, the worship of Baal, who was identical with Moloch. Manasseh, the 16th king of Judah, set up altars to Baal in groves and high places, prepared for the purpose, and made his children pass through the fire to that god. Israel also was no less involved in this departure from the monotheism of the Mosaic system, to the duo-theism of Chaldæa. In Samaria, the capital of Israel, after the revolt of the 10 tribes, Baal was extensively worshipped, until the time of Jehu, who destroyed the altars of Baal, and tore down the high places of his worship. When the Jews were reproved by the prophet for their idolatry, they insisted that ever since they had left off sacrificing to the queen of heaven, they had been consumed by sword and famine. As early as the times of the Judges, the whole Jewish people served Baal and Ashtoreth, and the vocabulary of Palestine geography attests the domestication of Baal-worship among the inhabitants, in the frequency with which the word Baal appears as a component part of the names of towns and cities, as Baalath, Baal-meon, Baal-peor, and Baal-tamar. Remnants of Baal-worship have descended either through the Jews or the Gentiles even to our own time, and exist to-day in nearly all Christian countries. In Sir John Sinclair's statistical account of Scotland, he describes a ceremony which used to be celebrated in Scotland on 1 May (O. S.), in which the inhabitants of a district, having assembled in a field, dug out a square trench in which they built a fire and baked a cake, and cutting it into as many pieces as there were persons, and blacking one piece over with charcoal, threw them into some convenient receptacle, when each one, blindfolded, drew a piece. He who drew the black piece was sacrificed to Baal, to propitiate his favor for the coming year. The same ceremony was long observed in some parts of Scotland and Ireland, except that the person who drew the black piece was made to leap three times through the flames, instead of being sacrificed, a similar substitution to that instituted by Manasseh, who "made his sons pass through the fire to Moloch." This ceremony is known by the name of Beltane, or Baal-tine.

Baal-zebub, bā-ăl'ze-bŭb. See BEELZEBUB.

Baalbek, bäl'bĕk, a locality in Syria, in a fertile valley at the foot of Antilibanus, 40 miles from Damascus, famous for its magnificent ruins. Of these, the chief is the temple of the Sun, built either by Antoninus Pius or by Septimius Severus; a rectangular building 290 by 160 feet. Some of the blocks used in its construction are 60 feet long by 12 thick; and its 54 columns, of which 6 are still standing, were 72 feet high and 22 in circumference. Near it is a temple of Jupiter, of smaller size, though still larger than the Parthenon at Athens, and there are other structures of an elaborately ornate type. Originally a centre of the sun-worship, it became a Roman colony under Julius Cæsar, was garrisoned by Augustus, and under Trajan acquired renown as the seat of an oracle. Under Constantine its temples became churches, but after being sacked by the Arabs in 748, and more completely pillaged by Tamerlane in 1401, it sank into hopeless decay. The work of destruction was completed by an earthquake in 1759. See Franberger, 'Die Akropolis von Baalbek' (1892); Baedeker, 'Syria and Palestine' (1894).

Baanites, bā-ă-nīts. See RELIGIOUS SECTS.

Baar, bär, a plateau in Germany, in the province of Baden and Würtemberg, formerly constituting a county of the Furstenberg principality. It contains the sources of the Danube.

Bab Ballads, The, a collection of humorous verses by W. S. Gilbert (q.v.) published in 1868. They form the source of several of the librettos of the Gilbert and Sullivan operas.

Bab-el-Mandeb, bäb'ĕl-män'dĕb (Arabic, the gate of tears, so called from the danger arising to small vessels from strong currents), the name of the strait between Arabia and the continent of Africa, by which the Red Sea is connected with the Gulf of Aden and the Indian Ocean. The Arabian peninsula here throws out a cape, bearing the same name as the strait, rising to the height of 865 feet. About 20 miles distant stands the wall-like coast of Africa, rising in Râs es Sean to the height of over 400 feet. Within the strait, but nearer to Arabia, lies the bare, rocky Island of Perim, since 1857 occupied by the British as a fort; its guns commanded the entrance to the Red Sea. The strait on the east side of this island is called the Little Strait, and that on the west the Great Strait.

Baba, bä'bạ (the old), in Slavonic mythology, a thunder-witch (the devil's grandmother), represented as a little, ugly old woman, with a monstrous nose, long teeth, and disheveled hair, flying through the sky in an iron mortar. By the Czechs she is called now the iron, now the golden, Baba. It is also a Turkish word, signifying father, originating, like our word papa, in the first efforts of children to speak. In Persia and Turkey it is prefixed as a title of honor to the names of ecclesiastics of distinction, especially of such as devote themselves to an ascetic life; it is often affixed in courtesy, also, to the names of other persons, as Ali-Baba. A cape near the northwest point of Asia Minor is known as Baba.

Bába Búdan, bä'bạ boo'dăn, a spur of the West Ghâts, Mysore, India, extending east for 15 miles, leaving a narrow opening at its west end for the passage of the Bhadra, and then south in an unbroken line for 20 miles, enclosing between itself and the main chain of the Ghâts a rich, but unhealthy valley. To this spur belong three peaks above 6,000 feet high, among these Mulaina-giri, 6,317 feet, the highest in the West Ghâts. On the slopes of Kalhatti, one of these peaks, is a hill station, a resort of Europeans during the heat. Coffee was first planted in India on another part of this spur toward the close of the 17th century, by a Mohammedan saint named Bába Búdan.

Bab'bage, Charles, English mathematician and inventor of a calculating machine: b. near Teignmouth, England, 26 Dec. 1792; d. 18 Oct. 1871. He was educated first at the Totnes Grammar School, and Peterhouse College, Cambridge, where he became closely associated with Herschel (afterward Sir John) and Mr. Peacock, then tutor of Trinity College. Being in possession of an independent fortune, Babbage was in a position to devote all his time and

energies to his favorite studies — mathematics and mechanics. In 1822 we find him broaching the idea of a difference engine, by which intricate arithmetical calculations could be correctly and rapidly performed. Through the recommendation of the Royal Society he received, in 1823, a grant from the government of £1,500 for the construction of such a machine. After a series of experiments lasting eight years, and an expenditure of £17,000 (£4,000 of which was sunk by the originator of the scheme, the balance voted by the government), Babbage abandoned the undertaking in favor of a much more complicated work, an analytical engine, worked with cards like the jacquard loom. The government, alarmed at the probable demands, refused to support Babbage in his new adventure, and as a quarrel ensued with his engineer, who withdrew his tools, the pet project was never completed. The machine, along with some 400 or 500 plans, was presented in 1843 to the King's College Museum, London. Among the many treatises he published on subjects connected with mathematics and mechanics, the most valuable and interesting are: 'On the Economy of Machinery and Manufactures'; 'The Decline of Science'; and an autobiographic sketch, 'Passages in the Life of a Philosopher.' In 1828 he was appointed Lucasian professor of mathematics in his university, an office he held for 11 years. In 1832 and 1834 he stood for Finsbury in the Radical interest, but was unsuccessful. He was one of the founders of the Royal Astronomical Society, and a Fellow of the Royal Society.

Bab'bitt, Isaac, American inventor: b. Taunton, Mass., 26 July 1799; d. 26 May 1862. He learned the goldsmith's trade; early became interested in the production of alloys; and in 1824 manufactured the first britannia ware in the United States. In 1839, he discovered the well-known anti-friction metal which bears his name, Babbitt metal (q.v.). For this discovery, the Massachusetts Charitable Mechanics' Association awarded him a gold medal in 1841, and subsequently Congress voted him $20,000.

Bab'bitt Metal, an alloy of copper, tin and antimony, invented and patented in 1839, by Isaac Babbitt (q.v.) of Boston. It is soft and nearly white, and is widely used as an anti-friction metal. The proportions of the constituent metals vary considerably in modern practice. Babbitt's original alloy contained 24 parts of tin, 4 parts of copper, and 8 parts of antimony. Many engineers prefer a larger proportion of tin, and the following mixture is recommended as giving a tough and very serviceable metal: Tin, 96 parts; copper, 4 parts; antimony, 8 parts. Lead is also added, in many cases, on account of its cheapness. In small amounts it is not usually objectionable, but the Babbitt metal that is sold in the market, ready-mixed, usually contains a considerably larger proportion of lead than its price would indicate. The alloy is usually melted and run, while fluid, directly into the bearings on which it is to be used, a space from an eighth to half an inch thick being left for it between the box and the shaft that is to be supported.

Bab'cock, Earle Jay, American educator: b. St. Charles, Minn., 11 June 1865. After working extensively with the United States Geological Survey he was appointed in 1902 director of the State School of Mines of North Dakota, and professor of chemistry and geology in the State University. He is the author of many special scientific articles and of geological reports.

Bab'cock, James Francis, American chemist: b. Boston, 23 Feb. 1844; d. Dorchester, Mass., 20 July 1897. He studied at Lawrence Scientific School, and became an analytical chemist and chemical expert. He was State assayer and inspector of liquors in Massachusetts, 1875–85, and city inspector of milk in Boston, 1885–89. While state assayer he brought about the insertion in the liquor statutes of the definition of the term "intoxicating liquor," known as the 3-per-cent limit. He is the inventor of the fire extinguisher which bears his name; a popular lecturer on scientific subjects; and has appeared as an expert chemical witness in important trials. He has published several reports on sanitation and the chemistry of food.

Bab'cock, Maltbie Davenport, American Presbyterian clergyman: b. Syracuse, N. Y., 3 Aug. 1858; d. Naples, Italy, 18 May 1901. He was graduated from Syracuse University in 1879, and Auburn Theological Seminary in 1883. He filled most successful and popular pastorates at Lockport, N. Y., Baltimore, Md., and at the Brick Presbyterian Church in New York. While on a visit to the Levant in 1901 he was seized with the Mediterranean fever and died in the International Hospital at Naples. A posthumous volume of his prose and verse, edited by his wife, appeared in 1901, entitled 'Thoughts for Every-Day Living.'

Bab'cock, Orville E., American military officer: b. Franklin, Vt., 25 Dec. 1835; d. 2 June 1884. He served with distinction in the Civil War, was a member of Gen. Grant's staff, and was made a brigadier-general of the regular army at the close of the war. When Grant was elected President, Babcock became his private secretary, and the superintending engineer of several important public works. He was indicted in 1876 for taking part in revenue frauds, but on his trial was acquitted.

Bab'cock, Stephen Moulton, American educator: b. Bridgewater, N. Y., 22 Oct. 1843. He was educated at Tufts College, Cornell University, and at Göttingen, Germany; and was graduated from Tufts College in 1866. He gave special attention to the chemistry of milk and its products, and was the inventor of the Babcock milk-tester. He was instructor of chemistry at Cornell University in 1875–6; professor of agricultural chemistry at the University of Wisconsin; and chemist to the New York State Experimental Station in 1888–1900. He is the author of numerous articles on the composition of milk and butter, and joint author with G. C. Caldwell of 'A Manual of Qualitative Chemical Analysis.'

Bab'cock, Washington Irving, American shipbuilder: b. Stonington, Ct., 21 Sept. 1858. He was graduated at the Brooklyn Polytechnic Institute in 1876, and at Rensselaer Polytechnic Institute in 1878. He was employed at the Roach Shipyard, Chester, Pa., in 1878–85, and with the Providence and Stonington Steamship Co., New York, in 1885–7; was superintendent of the Union Dry Dock Co., Buffalo, N. Y., in 1887–9; manager of the Chicago Shipbuilding Co., in 1889–99, becoming president of the latter in 1900.

Ba'bel, Tower of, the name of a structure in the Plain of Shinar, Mesopotamia. According to the 11th chapter of Genesis, it was begun by the descendants of Noah subsequent to the deluge, but not allowed to proceed to completion. It has commonly been identified with the great temple of Belus or Bel, one of the chief edifices in Babylon, and the huge mound called Birs Nimrud is generally regarded as its site, though another mound, which to this day bears the name of Babil, has been assigned by some as its site. Babel means literally "gate of God." The meaning "confusion" assigned to it in the Bible really belongs to a word of similar form. See BABYLON.

Babenberg, bä'bĕn-bĕrg, a princely Franconian family, whose castle occupied the site of the later Bamberg Cathedral. They were most prominent in the wars of the 10th century. The Austrian dynasty of 976–1246 was formerly believed to be sprung from them.

Baber, bā'bẽr (or "The Tiger"), the historical surname of Zehir-ed-din-Mohammed, the conqueror of Hindustan and founder of the so-called Mogul dynasty: b. 14 Feb. 1483; d. 26 Dec. 1530. Baber was of mixed Turkish and Mongol origin, but in feeling, as in personal characteristics, he was a Tartar (Turk), and often in his memoirs speaks most contemptuously of Mongols or Moguls. Yet Hindu ignorance has designated the throne which he established in India as that of the Great Mogul. At the age of 12, on his father's death, he ascended the insecure throne of Ferghana in Turkestan; soon after he was attacked on all sides by his uncles and other neighboring princes, which obliged him, in his turn, to assume the aggressive. Accordingly, at the age of 15, Baber seized on Samarcand, the capital of Timour, but, while thus engaged, a revolution at home deprived him of his sovereignty. After many years of an adventurous and romantic career, he raised an army, entered Hindustan, and was met by Ibrahim, the ruling Sultan of that country. The two armies fought the battle of Paniput, which decided the fate of India, on 21 April 1525. Baber, with his army of 12,000 men, completely overthrew that of Ibrahim, numbering 100,000, and entered Delhi in triumph. Difficulties and fresh foes had still to be encountered and mastered, but in the battle of Sakri, in February 1527, Baber utterly defeated the opposing Hindu princes, and then proclaimed himself Padishah, or emperor of Hindustan.

Babeuf, bä-bẽf', or **Babœuf, François Noel,** French communist, who called himself Caius Gracchus: b. Saint-Quentin, 1760; d. 28 May 1797. He founded in Paris a journal called the 'Tribune of the People' (1794), in which he advocated his system of communism, known as Babœuvism, and contemplating absolute equality and community of property. His followers were called Babœuvists. Betrayed in a conspiracy against the directory, aiming to put his theories into practice he was guillotined in Paris. His principal works were 'Perpetual Register of the Survey of Lands' (1780), and 'On the System of Population (1794). See Advielle, 'Histoire de Babeuf et du Babouvisme' (1884).

Bâbi, bä'be, the name of a modern Persian sect, derived from the title, Bâb-ed-Din (gate of the faith), assumed by its founder, Mirza Ali Mohammed, a native of Shiraz, who, in 1843 undertook to establish a new religion from a mixture of Mohammedan, Christian, Jewish, and Parsee elements. His controversies with the *mollahs* shortly led to his confinement to his own house, where he formulated his doctrines, privately instructed his disciples, and increased his pretensions. The sect soon became numerous; but on the accession of Nasir-ed-Din in 1848, apprehending persecution, they took up arms, proclaiming the advent of the Bâb as universal sovereign. The insurgents were reduced by famine, and most of them executed (1849–50). The Bâb had held aloof from the revolt, but was arrested and put to death, after a long imprisonment, in 1850. His successor was recognized in the youthful son of the governor of Teheran, who retired to Bagdad, where he afterward lived quietly. An attempt of three believers to assassinate the Shah, in 1852, led to a persecution of the sect; numbers were tortured and burned, among them Gurred-ul-Ain. Bâbism is at present widely diffused in Persia; its members live in apparent conformity to orthodox Mohammedanism, but privately holding the Bâb's doctrines, which are contained in an Arabic treatise, 'Biyan' (the exposition), written by the founder himself. They form essentially a system of Pantheism, with Gnostic and Buddhistic additions. All beings are emanations from the Deity, by whom they will ultimately be reabsorbed. Bâbism enjoins few prayers, and those only on fixed occasions; encourages hospitality and charity; prohibits polygamy, concubinage, and divorce; discourages asceticism and mendicancy; and directs women to discard the veil, and share as equals in the intercourse of social life. See Andreas, 'Die Babis in Persien' (1896); Browne, 'A Traveler's Narrative Written to Illustrate the Episode of the Bâb' (1892).

Bab'ington, Anthony, English Roman Catholic gentleman: b. Dettrick, Derbyshire, 1561; d. 20 Sept. 1586. He associated with others of his own persuasion to deliver Mary, Queen of Scots, but the plot being discovered, the conspirators were executed.

Bab'ington, Churchill, English philologist: b. Leicestershire, 1821; d. 13 Jan. 1889. He was educated at St. John's College, Cambridge, and was Disney professor of archæology there in 1865–80. He was a voluminous writer on ornithology, botany, archæology, numismatics, etc.; and a contributor to Smith's 'Dictionary of Christian Antiquities.'

Bab'ingtonite, a native, anhydrous silicate of calcium, iron and manganese, associated with an iron silicate having the composition $Fe_2(SiO_3)_3$. It is greenish-black in color, with a vitreous lustre, and crystallizes in the triclinic system. It occurs in Norway, Italy, and the British Isles, and in the United States has been found at Gouverneur, N. Y., and perhaps also at Athol, Mass. Its hardness varies from 5.5 to 6, and it has a specific gravity of about 3.36. The mineral was named for Dr. William Babington.

Babirussa, bäb'ĭ-roo'sa, a wild hog of the East Indies, remarkable for the long, exposed, canine teeth of the male. The upper tusks, instead of growing downward in the usual way, turn and grow upward through the skin on each side of the snout and curve backward until, in old animals, they may be 8 or 10 inches long,

and reach nearly to the eye. These hogs, which inhabit Celebes and Bouru, are almost hairless, long-legged, and active, and feed upon fallen fruits instead of rooting in the ground. One cannot see that the great tusks are of any present use, but Wallace suggests that they were useful to the ancestors of these pigs under different conditions, and were then kept worn down by service.

Babism, bäb'ĭzm. See BABI.

Babo, bä'bō, **Josef Marius von,** German poet: b. Ehrenbreitstein, 14 Jan. 1756; d. 5 Feb. 1822. He was professor of fine arts at Munich in 1778, and of æsthetics at Mannheim, and later became director in the Munich Military Academy, and superintendent of the theatre. He was the author of 'Otto of Wittelsbach,' a tragedy (1781); 'Oda' (1782); 'Dagobert, the Frankish King' (1787); 'The Pulse,' a comedy (1804), etc.

Baboo, bä'boo, or **Babu,** a Hindu title of respect equivalent to Sir or Mr. It is usually given to wealthy and educated native gentlemen, especially when of the mercantile class.

Baboon, băb-oon', a large, long-haired, terrestrial monkey of Africa or Arabia, belonging to the genus *Cynocephalus,* of the family *Cercopithecidæ.* All are of large size, have elongated, blunt muzzles, with nostrils at the extreme end, and great canine teeth which together give the face, when seen in profile, a dog-like aspect. The naked parts of the face, as well as the great callosities upon the buttocks, are often brilliantly colored. Some also have shaggy manes, and all add to their repulsive appearance a fierceness of disposition which makes them more feared than perhaps is necessary, for they rarely, if ever, have attacked human beings. All of the species go about in troops under the guidance and protection of several old males. They are rare in wooded regions, preferring rocky and bushy districts, like those in northern Africa, in Arabia, and in southeastern Africa. As their fore and hind limbs are of nearly equal length, and very stout, they go mostly on all fours, galloping swiftly and climbing rocks with agility. Their food is principally vegetable — fruits, berries, young sprouts, etc; but they also eat insects, worms, snails, and such young birds or small animals as they are able to catch. They do great damage to the plantations of the native Africans, ruthlessly spoiling much more than they are able to eat. The ancient Egyptians seem to have trained them to pick fruits, but within recent times their confinement in menageries, where they live and breed well, is the extent of their domestication. There is nothing attractive about any of them, either in appearance or disposition.

Among the best known is the great Arabian or sacred baboon, or *hamadryad* (*Cynocephalus hamadryas*), the one represented upon Egyptian monuments, and venerated by the primitive Egyptians. It is supposed that their habits of noisy activity at sunrise, as though adoring the sun-god, is the basis of this very ancient form of worship. Mummies of baboons are commonly found in tombs in the Nile valley; and the species itself is still abundant from the Sudan to southern Arabia. It is ashy gray in color, and has a heavy mane. The great baboon of South Africa, common in the wilder mountains of Cape Colony, is the chacma (*Cynocephalus porcarius*), which is dark-brown and has long hair but no mane, and a tail about half the length of the body, terminated by long, black tufts. This is the one most commonly seen in menageries. The mandril (*Cynocephalus mormon*) is still larger, exceeding a mastiff in size. It has short legs, a mere stump of a tail, and an enormous head, with a crest of greenish hair upon the forehead, and a beard which is orange-yellow; while the naked parts of the face consist mainly of a huge nose, light-blue in color, the skin of which is folded into ridges. The naked buttocks are bright scarlet. This ugly brute is one of the most ferocious and justly dreaded animals of the Congo forests. In the same region lives a second similar species called the drill (*Cynocephalus leucophæus*), which differs mainly in lacking the bright colors and ribs of the nose of the mandril. Several other baboons live in West Africa, but are not well known, although one reddish-brown species, the Guinea baboon (*Cynocephalus sphinx*) is commonly seen in the hands of showmen. A large monkey of southern Abyssinia, looking like a black, clipped French poodle, is substantially a true baboon, although it belongs to another genus; it is the gelada (*Theropithecus gelada*). Consult 'Cassell's Natural History,' Vol. I. (1885).

Ba'brius, a Greek fabulist whose fables in verse are variously referred to the time immediately preceding the Augustan age, and to the 3d century of our era; his name also shows variants, as Babrias, Gabrius. Till 1842 only a few fragments of Babrius were known to be extant; but in that year, in the Laura of Mount Athos was discovered a manuscript containing 123 of his fables. In 1846 Sir George Cornewall Lewis published them together with the pre-existing fragments, and in 1859 or 1860 appeared a good English version by James Davies. The fables have also been edited by W. G. Rutherford (1883) and by Crusius (1897).

Babuyanes, bä'boo-yän'ez, or **Madjicosima Islands,** a number of islands lying about 30 miles north of Luzon, and generally considered the most northern of the Philippines. The chief islands are Kamiguin, area 54 square miles; Babuyan Claro, 36 square miles; Calayán, 37 square miles; Fuga, 21 square miles; and Dalupiri, 20 square miles. They are subject to the Loo-Choo Islands; aggregate population about 12,000.

Bab'ylans or **Babyllus, Saint,** a bishop of Antioch between 237 and 250. He declined to admit to public worship the Emperor Philip, who had murdered his brother Gordianus in order to gain the throne. In the Roman calendar his day is celebrated on 24 January; in the Greek on 4 September.

Bab'ylon, See BABYLONIA.

Babylon, N. Y., village in Suffolk County, Long Island, 37 miles east of New York; popular as a summer resort on account of its fine beach, and as a rendezvous for sportsmen by reason of its opportunities for fishing. Pop. (1900) 2,157.

Babylonia. Discoveries of the recent decades seem to confirm the idea that Babylonia is the cradle of civilization. The country, which is nearly enclosed by the Tigris and Euphrates from Bagdad to the Persian Gulf, is bounded on the north by Mesopotamia; on the east by the

1. Bearded Ape (Cynocephalus silenus).
2. Chacma (Cynocephalus porcarius).
3. Tufted Baboon (Cynopithecus niger).
4. Hamadryad (Cynocephalus hamadryas).
5. Gelada (Cynocephalus gelada).
6. Mandrill (Cynocephalus mormon).

plain of Elam; on the south by the Persian Gulf; and on the west by the Arabian desert. It constitutes the largest portion of the country now known as "Irâq el Arabi." A considerable part of this alluvial plain has been made through deposits by the river. This land-making process continues at the present time at the rate of about 70 feet per year.

At one time the plain was covered with a perfect network of canals which carried agricultural prosperity to every part of the land. The neglect of these has changed the conditions of the country so completely that instead of a fertility which was once the wonder of the ancient world, a cheerless waste now presents itself. Some months of the year the country is partially covered with swamps and marshes, while the remaining portion is a desolate plain.

Here and there throughout the land are to be seen mounds of débris, every one of which covers the remains of a long-forgotten civilization. About the middle of the last century a number of English explorers, Loftus, Layard, and Taylor, visited the ruins of some of the important cities. Through their tentative investigations Nuffar (Nippur or Calneh), Warka (Uruk or Erech), Senkera (Larsa), Muqayyar (Ur), Abu Shahrain (Eridu), besides Babylon, Borsippa, and other cities were located. A few decades later Rassam, also an Englishman, discovered that the ruins known as Abu-Habba represented the ancient Sippara; and decided definitely also that Tell-Ibrahim was Kutha (Cutha). The ancient names of most of these cities were known through the Old Testament.

The first methodical and extensive excavations in the country were begun by the French, under De Sarzec, at Tello (Shir-pur-la), in 1876. These were followed in 1889 by those of the Americans, representing the University of Pennsylvania, under Peters, for about six months, followed by Hilprecht and Haynes. For a few months in 1894 Scheil, a Frenchman, in the interest of the Turkish government, excavated at the ruins of Abu-Habba (Sippara). The Germans under Koldewey and Moritz devoted several months to the exploration of two sites known as El-Hibba and Surghul; but in 1900 Koldewey began systematic excavations among the mounds of ancient Babylon. It is expected that the Germans at Babylon, the French at Tello, and the Americans at Nuffar will continue their operations for many years.

The excavations at Tello and Nuffar have been exceptionally fruitful in important results, especially those conducted at the latter place by the University of Pennsylvania. At Tello were uncovered the remains of an ancient civilization of the 3d and 4th millenniums B.C., representing the Sumerian people. The Nippur excavations yielded antiquities of the Semitic race as well as the Sumerian. At this city the excavators were able to examine the remains of the longest period of occupation known up to the present time. The lowest stratum of débris yielded antiquities which belong to the 7th millennium B.C., while the city continued to be inhabited until about 1000 A.D.

The earliest inhabitants of the country, which was known in the early period as Shumer (Biblical Shinar), are called Sumerians. By the aid of the statues and inscriptions discovered, the physiognomy and customs of this people become comparatively well known. The remains of their civilization as regards sculpture, engraving, etc., are of an exceptionally highly developed character as revealed by the antiquities, some of which are remarkable for their beauty and the fineness of their execution. They show that the flower of art in this country belongs to about the 4th millennium B.C. Their writing also, instead of being primitive, is so far removed from the original hieroglyphs that in many instances the pictorial outline can no longer be recognized. These things demonstrate the fact that back of that which is now known as the earliest there must be a long period of development covering many centuries.

The Sumerians spoke an agglutinative tongue which belongs to that great unclassifiable group of languages known as Turanian. Clay was principally used as their writing material. The impression made by the stylus upon the soft clay has the appearance of a wedge, for which the Latin word *cuneus* is used; hence cuneiform writing. The characters, having ideographic and phonetic values, are made up from one to a dozen or more wedges. There are over 500 characters, some of which have many values. For the different characters and combinations of two or more, about 20,000 values are already known.

It has not been ascertained whence the Sumerians or Semites came. In 4500 B.C. the latter had already entered the land. They gradually conquered their predecessors, the Sumerian people, and adopted their script for their own language. Side by side these two people lived in the country until the amalgamation known to us as Babylonian was more or less complete; at least the Semitic population succeeded in superseding the Sumerian, whose identity seems to be practically lost in the later period. The Sumerian language, however, continued to be used by the Babylonians until the close of their history, especially for official, legal and liturgical purposes.

The number of inscriptions, small and large, discovered in Babylonia up to the present time, number fully 150,000. At Tello, De Sarzec unearthed a library containing about 30,000 tablets belonging to the time of Gudea 3000 B.C. The temple library at Nippur, although only one twelfth part excavated, has yielded to Prof. Hilprecht over 20,000 tablets belonging to the 3d millennium B.C. It contained mathematical, astronomical, medical, historical, linguistic, religious, etc., texts, arranged and classified according to subjects. Besides the clay tablets, cylinders, and prisms, most important documents in stone have been found, which have furnished the data upon which the knowledge of the early period is largely based.

Through other sources, particularly the Babylonian duplicates found in Ashurbanapal's library at Nineveh, considerable is known concerning the literature of this people. Notably might be mentioned the Creation and Nimrod epics, the Deluge story, which greatly resemble the Biblical accounts; Ishtar's descent into Hades; the Etana legend; Adapa and the South Wind, etc. Here properly should be mentioned also the codes of laws upon which the decisions of the kings and judges were made, particularly the code of Hammurabi (Amraphel, Gen. xiv.), discovered by the French, in Susa, under De Morgan. It consists of 282 laws written on a stela which stands over seven feet high. This had been carried away by the old national enemy

of Babylonia, the Elamites. Very extensive also is the knowledge of the customs and manners of the people gained through the thousands of contract tablets dated in the reigns of kings of all periods. Practically every kind of legal and domestic contract imaginable, mortgages, deeds of sale, promissory notes, guarantees, etc., the archives of business firms, notably the Egibi House of Babylon, and the Murashu Sons of Nippur have been found. Most valuable for the decipherment of the inscriptions have been the syllabaries, or sign lists, in which the different values of characters are given. Commentaries; lists of gods, names, places, temples, animals, stones, etc.; incantations, hymns, penitential psalms, prayers, etc., are included among the tablets discovered.

The earliest inscriptions reveal a polytheism in a developed state. Most of the gods have Sumerian as well as Semitic names. Until the religion of the Sumerians, or of the Semites, prior to their occupation of this country is known, it will be impossible to ascertain with which people the different gods and religious conceptions originated. The pantheon, which was practically different in every period of Babylonian history, is exceedingly large. Some of the gods mentioned most frequently in the inscriptions are: Anu, Bêl, and Ea, the important triad of the early period; Merodach, Shamash, Sin, Ishtar, Nergal, Nebo, Nusku, Ninib, Gula, etc.

Each city had its temple, which was dedicated to some particular god; for example, Ekur, at Nippur, was sacred to Bêl; Esaggil, in Babylon, to Merodach. In addition to the patron deity, shrines to other gods were found in each sanctuary. At Nippur, besides Bêl, 24 other gods were worshipped, for whom shrines were set up within the temple precincts. Through the researches of Prof. Hilprecht in the trenches at Nippur, and in connection with the inscriptions discovered, the real conception of a Babylonian temple and its tower is made known for the first time. The temple had an inner and outer court, both of which were nearly square, the latter being somewhat smaller than the former. The prominent feature of the temple architecture was the *ziggurrat*, or storied-tower, which occupied nearly one third of the area of the inner court. In close proximity to the tower stood the temple proper, where the sacrifices were offered. The ziggurrat consisted of quadrangular platforms, one superimposed upon the other, on the top of which was to be found the shrine. The number of platforms varied according to the period and ability of the builder. In the 3d millennium B.C. the number generally appears to have been three. The ziggurrat had its origin in the earliest pre-Semitic period, when it was regarded as the tomb of the god. At that time it was the central feature of a fire necropole, or cemetery. The Sumerians cremated their dead. In an early stratum at Nippur one of their crematoriums was found. The remains of the incineration were placed in jars, thousands of which were found buried around the ziggurrat. It is not known what the Semites did with their dead, but when they became the dominant people of the land the conception of the temple and ziggurrat seems to have been changed, for thereafter no burials are found within the courts of the temple.

In their cosmology the Semitic Babylonian conception of the earth was a mountain over which the god Bêl ruled. This they believed extended down into Ea's region (subterranean waters), and also that it reached up unto that of Anu (Heaven). They regarded the ziggurrat as symbolical of the earth, the dominion of Bêl. In their inscriptions, therefore, concerning the building or restorations of these towers, the following expression is repeatedly found: «I laid the foundations of the ziggurrat in the breast of the earth and built it up that its head was in the heavens» (compare the story of Babel, Gen. xi.), thus showing that the ziggurrat was a representation of Bêl's kingdom, the earth.

In connection with the temple library at Nippur a school or department of instruction was found. Within its rooms were discovered textbooks, and exercises of the students. At Sippara a school similar in character was also found. The complete excavation of all important Babylonian cities will doubtless bring to light a temple, a library, and a school in each.

Recent investigations show that in a general way the Babylonian chronology coincides fairly well with the Hebrew from about the time of Abraham. A great many rulers prior to Hammurabi (Abraham's co-temporary, about 2200 B.C.) are known through their inscriptions. King Nabonidus, the historian and archæologist (556–538) stated that Naram-Sin had founded the temple of Shamash at Sippara 3,200 years before his time. This in round numbers would make his father, Sargon's date 3800 B.C. Sargon was a powerful ruler; having conquered all the city kingdoms of his land, he extended his conquests as far as the Mediterranean. Many pre-Sargonic rulers are also known, of whom notably may be mentioned Lugalzaggisi, about 4500 B.C., who conquered the ancient world from the Persian Gulf to the shores of the Mediterranean. A number of important rulers of Tello also belonging to this period are known. Between Sargon and Hammurabi several dynasties are more or less completely filled out. Among the important rulers whose names are known should be mentioned Gudea about 3000 B.C., who held sway over the whole of Babylonia; Ur-Gur about 2700 B.C., who erected temples in Ur, Nippur, Erech, and other cities; and also his son Dungi, who extended his rule over parts of Elam and Syria. Hammurabi about 2200 B.C. inherited a throne which was subject to Larsa, but this mighty sovereign overthrew its king and also Elam's, and succeeded not only in uniting the petty principalities under one rule, but he reorganized them in such a way that the kingdom had an uninterrupted history for several centuries. Hammurabi was the sixth king of the first dynasty of Babylon. This was followed by the so-called second dynasty of Babylon; the foreign dynasty of Cassite rulers; 1580–1180 B.C., the dynasty of Pashi 1177–1043, and other rulers. During the period which followed, Babylonia was subject to Assyria until the powerful Neo-Babylonian rule began with the Chaldæan Nabopolassar, 626–605, and his son Nebuchadrezzar II. 605–562. These were succeeded by Evil-Merodach, 562–560; Neriglissar, 560–556; Labosoarchod, 556; and Nabonidus, 555–538. With the overthrow of the latter and his son Belshazzar, the Achæmenian rule began, which continued until the time of Alexander the Great. This

Lower—Mounds covering the Temple of Bêl.

great conqueror was followed by the Seleucid and Arsacid kings. Under the Parthians all that remained of Babylonian culture died out, when the knowledge of the language and writing was entirely lost. Jews continued to live on some of the mounds of Babylonia until about 1000 A.D., when finally the country was given up to the Bedouin and the Arab.

Bab'ylo'nian Exile, or **Captivity.** It seems to have been part of the statecraft of the ancient Assyrians to remove the people of conquered nations and plant them in unoccupied parts of the dominion, as far distant as possible from the home country of the victims. This custom grew out of civil and geographical conditions. The degree of national intercourse requisite for maintaining a proper ascendency over the subjugated nation could not be maintained if they were allowed to remain in their own land. Consequently, deportation was necessary — a process which has come to be designated in our language by the word captivity. Anciently, deported nations were not treated with that cruelty we are in the habit of associating with the captive. The captivity of the Jews, who are more especially to be treated in this article, demand the preceding remarks in order to aid in a proper understanding of the frequent notices we find in the Scriptures of the consequence to which these people attained in their foreign residences. There are two Babylonish captivities of the Jews, having their beginnings at different times, although their endings were synchronous. In the civil dissensions following the death of Saul, and culminating at the death of Solomon, the tribes north of the mountains of Ephraim, and those east of Jordan, separated from the rest, leaving Judah and Benjamin in the naturally fortified province of the south. To the north of the revolted tribes lay the kingdom of Syria, then powerful and extensive. Syria had an old feud with Israel, ever since David had made Damascus, the Syrian capital, tributary to himself. Rezon had regained the city under Solomon, but was "an adversary to Israel all the days of Solomon." The attention of Syria was now turned to the defenseless condition of the revolted tribes. They had no longer the fortifications and fastnesses from which David had sallied forth to the northern plains at the foot of the Anti-Lebanon. Judah had, meanwhile, made a treaty, in the reign of Asa her third king, with the Syrian power, who, by his counsel and stratagem, had been induced to break a former league with Israel (1 Kings xv.). Judah also, fearing inroads from the north, had built two new fortifications in the passes of Benjamin (Geba and Mizpeh), and used all her arts to keep herself in favor with Syria, and on the other hand turned her pampered ally against the revolted and unprotected tribes at the north. Israel, tired at length of the continual exposures to Syrian invasion, and exasperated at the immunity and prosperity of the rival Judah, formed a conspiracy with Syria (during the reign of Pekah in Israel and Ahaz in Judah) against her southern antagonist. In the emergency Judah appealed to the Assyrian power, and Tiglath Pileser came against Israel, carried captive a portion of its inhabitants, and then marched upon Syria, slew its king, subdued its capital, and absorbed it into the Assyrian empire, from which it reappears only in the time of Alexander the Great. The successor of Pileser, exasperated by an attempted conspiracy of Hoshea with the king of Egypt, took Samaria, and subdued Israel to a tributary relation, taking away to Babylon the people whom Pileser had left in the first deportation. Thus was accomplished the first captivity of the numerically most powerful branch of the divided house of Israel (721 B.C.). They were first in the subjugation to foreign power from purely geographical considerations. A little more than a hundred years after, Judah, from her mountain fastnesses, followed Israel into the Assyrian empire, in the second great Babylonish captivity. Disregarding some chronological differences, Judah seems to have been progressively carried into captivity, like Israel, by at least two, and perhaps three successive deportations. The first was 598 B.C., and was probably made with the direct object of colonizing the city of Nineveh, which the Assyrian monarch was then endeavoring to restore. The second was in the reign of Zedekiah. Judah had for three successive reigns been heavily tributary to Assyria. Zedekiah rebelled against the tribute, and, like Israel, further exasperated her master by calling upon Egypt in her extremity. In revenge, Nebuchadnezzar burnt the temple and city, put out the eyes of Zedekiah, and led away the people to Babylon, and so ended the Jewish kingdom (588 B.C.), never again to be restored to a national existence; for when, 70 years after the second captivity, the permission to return was given, only a very small part of the Jewish people were in a condition to desire a removal, having become thoroughly naturalized in their foreign dwellings; and even if they had desired it, it would have been only a return to a Medo-Persian satrapy, not to the glory of their ancient kingdom and temple-worship. They remained by the rivers of Babylon and wept. See Daniel; Ezekiel; Ezra; Jews.

The term "Babylonish Captivity" is frequently applied by writers of Church history to the residence of the Popes at Avignon for nearly 70 years.

Bacacay, ba-kä'kī, Philippines, a town in the province of Albay, Luzon Island. It is situated on the Gulf of Albay. Pop. 10,550.

Bacalao, bä'ka-lä'ō. See Cod.

Bacara, ba-kär'ra, Philippines, a town of Luzon in the province of Ilocos Norte. Pop. 13,735.

Baccanarists. See Jesuits.

Baccarat, bä-ka-ra', a town of France, in the department of Meurthe-et-Moselle, having the most important plate glass works in France. Pop. (1900) 6,772.

Baccarat', a game of Italian origin played with ordinary playing cards; very simple in details and freer from complications than most games at cards. Any number of players may participate, and as many packs of cards may be used as necessary, the number being increased to correspond with the number of players. The member of the party selected to act as banker deals out the cards from a box, after they have been shuffled. The face cards each count 10, and the others according to the numbers of their spots. After the bets have been made, the banker deals two cards to each of the players, including himself, but the other players must receive their cards before the banker is served. The aim of the players is to make the numbers 9, 19, 29, or as nearly those as possible, as 8, 18, and 28. Any player is at liberty either to "stand" or to be "content" with the two cards at first dealt, or to call for more, at the risk of exceeding 29, when his stake is forfeited to the dealer. If, after the first distribution of two cards to each, any player has a "natural,"—that is, a sum making 9, or next in value, 19,—he declares it wins, and the banker pays all who hold superior hands to his own, and claims from those holding inferior hands. The players stake their money separately, there being, in fact, as many separate games in progress as there are players, and the spectators may wager their money on any one of them, all of which must be accepted by the banker. Prior to the banker making a start, he names the amount of the bank. Any one sitting down at the table has the right to call the whole of the bank, selecting the left or the right on which to pick up the cards. Previous to the banker dealing the cards, it is the duty of two croupiers, one on the right and the other on the left, to count up the stakes deposited on either side, and then make up the bank. Thus the banker knows, to the smallest coin, the exact amount of his liabilities.

Bacchanalia, bäk'ka-nā'lĭ-a, feasts in honor of Bacchus, or Dionysos, characterized by licentiousness and revelry, and celebrated in ancient Athens. In the processions were bands of Bacchantes of both sexes, who wandered about rioting and dancing. They were clothed in fawn skins, crowned with ivy, and bore in their hands *thyrsi,* that is, spears entwined with ivy, or having a pine cone stuck on the point. These feasts passed from the Greeks to the Romans, who celebrated them with still greater dissoluteness till the Senate abolished them, 186 B.C.

Bacchante, bäk-kän'tē, a person taking part in revels in honor of Bacchus.

Bacchiglione, bäk'kē-lyō'nē, a river of northern Italy. It rises in the Alps, passes through the towns of Vicenza and Padua, and enters the Adriatic near Chioggia, after a course of about 90 miles.

Bacchus, bäk'kŭs, or **Dionysos,** the god of wine. His history is one of the most perplexing in the Greek mythology. Semele was pregnant with him by Zeus, but became a victim of the craft of Hera. Zeus hastened to save the unborn fruit of his embrace, and concealed it till mature in his own thigh. He afterward committed the infant to Hermes, who carried him to the nymphs of Nysa in India, where he grew and prospered. His teacher was Silenus, afterward his constant companion.

In the vales of Nysa Bacchus invented the preparation of a beverage from grapes, and taught the planting of vines. To spread the knowledge of his invention he traveled over almost the whole known world, and received in every quarter divine honors. Drawn by lions he began his march, which resembled a triumphal pomp, with a great suite of men and women, Sileni, Satyrs, and Mænades. Inspired by the presence of the god, rejoicing, brandishing the *thyrsus,* and crowned with vines and ivy, they danced around him, shouting, "*Evoe! Eleleus!*" over hill and valley, accompanied by the tones of Phrygian flutes and timbrels. The Thebans would not acknowledge his divinity, and Pentheus armed himself against him. Bacchus resolved to punish the crime, and inspired the women with a fury which drove them from their dwellings to wander on Mount Cithæron. Pentheus himself was torn in pieces by his own mother and her sisters, to whom he appeared a wild beast. Bacchus punished the daughters of Mynias, who derided his feasts, with frenzy and transformation. At Naxos some Tuscan sailors attempted to carry him off to Italy, supposing him from his purple robe to be the son of a king. They fettered him; but the fetters fell off, vines and ivy entwined the vessel, and kept it fixed in the midst of the sea: the god transformed himself to a lion, and the seamen, seized with madness, leaped into the waves, where they were changed into dolphins. On the other hand, he rewarded such as received him hospitably and rendered him worship, as, for instance, Midas, who restored to him the faithful Silenus.

His love was shared by several; but Ariadne, whom he found deserted upon Naxos, alone was elevated to the dignity of a wife, and became a sharer of his immortality. To confer the same favor on his mother, Semele, he descended into the realms of Pluto, and conducted her to Olympus, where she was henceforth called Thyone. In the dreadful war with the giants he fought heroically, and saved the gods from impending ruin. During the rejoicing for victory Zeus joyfully cried to him, "*Evan, evoe!*" (Well done, my son!), with which words Bacchus was afterward usually saluted. We find him represented with the round, soft, and graceful form of a maiden rather than with that of a young man. An ornament peculiar to him is the tiara. His long waving hair is gathered behind in a knot, and wreathed with sprigs of ivy and vine leaves. He is usually naked; sometimes he has an ample mantle hung negligently round his shoulders; sometimes a fawn skin hangs across his breast. The earlier bearded Bacchus is properly of Indian or Egyptian origin. His head is sometimes shown with small horns (the symbol of invincible force). In his hand is borne a *thyrsus,* or a drinking cup. The bull, panther, ass, and goat were symbolically associated with this god.

Lower—Excavations in the Temple area. Pavement of Ur-Gur, 2700 B. C. Pre-Sargonic strata in the foreground.

The feasts consecrated to Bacchus were termed *Bacchanalia, Dionysia,* or in general *Orgia.* They were celebrated with peculiar solemnity in Athens, where the years were universally reckoned by them, and during their continuance the least violence toward a citizen was a capital crime. The great Dionysia were celebrated in spring. The most important part of the celebration was a procession representing the triumph of Bacchus. This was composed of a train of Bacchantes of both sexes, who were masked, clothed in fawn skins, crowned with ivy, and bore in their hands drinking cups and rods entwined with ivy (*thyrsi*). Amidst this mad crowd marched in beautiful order the delegated bodies of the *phratria* (corporations of citizens). They bore upon their heads consecrated baskets, which contained first-fruits of every kind, cakes of different shape, and various mysterious symbols. This procession was usually in the night-time. The day was devoted to spectacles and other recreations. At a very early hour they went to the theatre of Bacchus, where musical or dramatical performances were exhibited. Thespis, known as the inventor of tragedy, is said to have introduced into the Bacchic performance an actor who carried on a dialogue with the *coryphæus* (leader) regarding the myths narrated of Bacchus or some other divinity. The chorus surrounding its leader, stood on the steps of the altar of Bacchus, while the actor occupied a table. Some regard this as the origin of the stage. The vintage festivals in rural districts were celebrated by Bacchic processions, ruder in form than those of Athens, but characterized by the same wild license and ribaldry. Coarse ridicule of individuals was a marked feature of these occasions.

Bacchylides, băk-kĭl'ĭ-dēz, Greek poet who flourished about 470 B.C.; a native of Julis, a town on the Island of Cos. He was a cousin of the still more famous lyric poet Simonides, with whom he remained for some time at the court of Hiero in Sicily. He traveled also in the Peloponnesus, and is said to have been a rival of Pindar. Until recently, this poet was known to the modern world only in fragments of beautiful versification. In 1895, however, a well-preserved text was discovered and published, and Bacchylides has now taken permanent place as a master of Greek verse. An English translation of the poems appeared in 1897.

Bacciocchi, bä-chŏk'kē, **Felice Pasquale,** Corsican captain: b. Corsica, 18 May 1762; d. Bologna, 27 April 1841. In 1797 he married Maria Elisa Bonaparte. In 1805, when Napoleon made his sister Princess of Lucca and Piombino, Bacciocchi was crowned with his wife. After the emperor's fall, he lived quietly and in reduced circumstances at Bologna.

Bacciocchi, Maria Anna Elisa Bonaparte, the eldest sister of Napoleon Bonaparte: b. Ajaccio, Corsica, 1777: d. 7 Aug. 1820. She married Felice Bacciocchi, and was created by her brother, in 1805, Princess of Lucca, Piombino, Massa, and Carrara, and in 1809 Grand Duchess of Tuscany. She shared her brother's fall and spent her last years in Austria, dying on her estate near Trieste. Her only son died in 1833, and her only daughter, the Countess Camerata, in 1869.

Bach, bäH, **Alexander von.** Austrian statesman: b. Loosdorf, 4 Jan. 1813: d. 15 Nov. 1892. He was minister of justice in 1848, of the interior in 1849–59; and, subsequently, ambassador to Rome. In 1855, he negotiated the concordat with the papacy which brought Austria into submission to the Roman Church.

Bach, Heinrich, German musician: b. 16 Sept, 1615; d. 10 July 1691. He was the father of Johann Christoph and Johann Michael Bach; organist at Arnstadt.

Bach, Johann Christian, German musician: b. Erfurt, 1640, d. 1682. He was a son of Johannes Bach, the great uncle of Johann Sebastian Bach.

Bach, Johann Christian, German musician: b. Leipsic, 1735; d. 1782. He was a son of Johann Sebastian Bach, and was organist in the Cathedral of Milan 1754–9, and in London, 1759–82, from which residences he was surnamed "the Milanese" and "the English." He composed operas, masses, *Te Deums,* etc.

Bach, Johann Christoph Friedrich, German musician: b. Leipsic, 1732; d. 1795. He was a son of Johann Sebastian Bach, and was for a long period music master to Count Schaumburg at Bückeburg.

Bach, Johann Michael, German composer and instrument maker: b. 1648; d. 1694. He was a son of Heinrich Bach and the father-in-law of Johann Sebastian Bach.

Bach, Johann Sebastian, German musician and composer: b. Eisenach, 21 Mar. 1685; d. Leipsic, 28 July, 1750. Bach was the most profound and original musical thinker the world has ever seen. He is the master of masters; from him most of the great composers have drawn inspiration. When Mozart heard one of his pieces at Leipsic, in 1788, he exclaimed: "Thank Heaven! here at last is something new that I can learn from." "Not Bach (brook) but 'Ocean' should be his name," Beethoven exclaimed. Mendelssohn made enthusiastic efforts to revive the interest in Bach. Schumann helped to found the Bach Society and urged students, if they would become thorough musicians, to make Bach their daily bread. Chopin confessed that before giving a concert he locked himself up a fortnight with nothing but Bach to play. Franz devoted a great part of his life to adapting this master's works for use in modern concert halls. Liszt and Rubinstein adored and played him. Wagner, as he grew older, played Bach more and more; his vocal compositions he pronounced the most perfect ever written; and he said that the proper interpretation of them was the noblest task for contemporary musicians. The only dissenting voice in this chorus of praise was that of Berlioz; but, as Saint-Saëns (one of the principal worshipers), has pointed out, this was due solely to the fact that Berlioz was not familiar with the works of Bach. His pre-eminence is the more remarkable when we remember that he was born as early as 1685; but it seems perhaps a trifle less astonishing when we bear in mind that Johann Sebastian inherited the accumulated musical gifts of a long line of ancestors. "Throughout six generations," says Forkel, "there were hardly two or three members of this family who did not inherit a natural talent

for music, and make the cultivation of this art the principal occupation of their life." For more than a century there were so many representatives of this widely-scattered family that in one place, at any rate (Erfurt), town musicians came to be called "Bachs," even when that family did not happen to be represented among them. After the culmination had been reached, however, in Johann Sebastian, the family-tree soon withered, although some of his sons play a quite considerable rôle in musical history.

At the age of 10, Johann Sebastian was left an orphan, in care of his older brother, John Christoph, who appears to have been jealous of the boy's musical gifts. Christoph had got together a collection of the best German organ music of the time, which Sebastian was very eager to get at and study. Denied access to it, he managed to smuggle it into the garret, where, for six months, he busied himself making a copy of it on moonlit nights. But the brother at last discovered his secret and took away from him both the copy and the original. This is only one instance of many showing how Sebastian was determined to educate himself in face of all obstacles. Several times he went on foot to Hamburg — a distance of twenty-five miles — to hear the famous organist Reinken; subsequently he made a similar trip to hear the illustrious organist Buxtehude at Lübeck. This happened when he himself was already busy as organist and choirmaster at Arnstadt. Previously to that he had, as a boy, helped to support himself by joining a choir of boys who sang at funerals and weddings, as well as in church and in the street. He missed no chance to practice on the violin, the organ, and the piano — or, rather, the harpsichord and clavichord, which were the predecessors of the pianoforte. To these tasks, and to his efforts at composition, he often devoted whole nights. He got his first salaried position (as violinist) in 1703 at Weimar, but left this post after a few months for that of organist at Arnstadt. It was thence that he made the trip (a foot tour of over 200 miles) to Lübeck, already referred to, to hear Buxtehude. He had obtained a four weeks' leave of absence, but was so delighted with his opportunities for improvement at Lübeck that he remained four months, until peremptorily called back. The church consistory of Arnstadt took this occasion to reprimand him, not only for prolonging his leave of absence, but for neglecting rehearsals, going to a wine cellar during the sermon, allowing a strange maiden to make music in the choir, and for "having made extraordinary variations in the chorals, and intermixing many strange sounds, so that thereby the congregation were confounded." Yet, with all his faults, they loved him still and allowed him to remain at his post, till he left of his own accord, having secured a position as organist at Mühlhausen. Here, too, however, he did not remain long, as still better opportunities presented themselves to him at Weimar, where the Duke Wilhelm Ernst had his court. This duke was deeply interested in the religion of the German Protestant Church and was glad to avail himself of the services of Bach, who was destined to become the chief representative of the music of that church, as Palestrina was of the Catholic Church. Here Bach remained nine years, during which time he wrote many of his master works for organ and church choir. In 1717 he accepted a position in Köthen which involved a complete change in his activity. Instead of having an organ and a choir to occupy his time he had the duty, as Kapellmeister, of writing and rehearsing works for the orchestra as a whole or for groups of orchestral instruments (chamber music). In 1720 he was a candidate for the post of organist at the Jacobi Kirche in Hamburg; but, although he was at this time already famous as an organist, he failed to get the place, an obscure young man having secured it after paying $1,000 for the office. Three years later Bach became the cantor of the Thomasschule at Leipsic and director of the music in the two principal churches; this position he held twenty-seven years, till his death, 28 July 1750, at the age of 65.

Bach was twice married and became the father of 20 children; 5 sons and 5 daughters died before him, while 6 sons and 4 daughters survived him. His first wife was also a Bach — a cousin; she died in 1820, while he was on a concert tour. Eighteen months after her death he married a girl of 21 who was also musical; yet none of the 13 children by this second marriage attained as high a rank as some of the seven by the first wife. The second wife helped him copy his MSS. (which he was constantly revising) and in course of time her handwriting came to resemble his so closely that the two were hard to distinguish. In no way did Bach differ more widely from his great contemporary, Handel, than in his family life; Handel died a bachelor. There were times when Bach found it difficult to bear the material burden of his large family, but he was not so poor in his lifetime as is usually supposed. His income from various sources was, it is true, only about $500 at the best; but the purchasing power of that sum was equal to $3,000 in our day. It was after his death that the pinch of poverty was felt; his widow died in an almshouse; he himself was buried in a pauper's grave. For more than a century no one knew the exact place of this grave; the circumstances of its discovery read like a detective story. Some years ago it became necessary to rebuild the old Johannis Church in Leipsic, and, in connection with this, to remove the bones from that part of the adjoining cemetery in which Bach was believed to have been buried. The director of the archives, Wustmann, took this opportunity to search for Bach's grave. He had found in the books of the Johannis Hospital an item stating that $4 had been paid for Johann Sebastian Bach's oak coffin, which gave him his principal clue, for oak coffins were seldom used in those days. Near the place where Bach was believed to have been buried he found two oak coffins, one containing the remains of a young woman, the other the bones of a man, whose skull was so unique as to arouse the suspicion at once that it was Bach's. It was placed in the hands of the famous anatomist, Prof. His, who, after a long series of comparative investigations, came to the conclusion that there could be no doubt whatever that the skull was Bach's. He embodied his argument in a brochure, "Forschungen über Bach's Grabstette und Gebeine." The fact that Bach's con-

temporaries thus took no note of his burial place is disgraceful evidence that they never dreamed he was destined to rank as the greatest of all musical geniuses. Further evidence of this lies in the circumstance that he really brought about his death by his efforts to save some of his unappreciated MSS. from destruction by engraving them on copper plates. This led to serious trouble with his eyes; two operations by an English surgeon were followed by total blindness, which made it impossible for him to complete his great work, "The Art of Fugue". He dictated for its final number a choral, "When we are overwhelmed by Woe," and died not long afterward.

The thematic catalogue of his works contains 1,110 instrumental and 1,936 vocal numbers. All of them combined probably never brought him in as much as the $1,175 paid at a Berlin auction sale a few years ago for three of his MSS. Until 1829, when Mendelssohn, after overcoming a good deal of opposition, succeeded in producing the wonderful 'Saint Matthew's Passion' in Berlin, for the first time since its composer's death, the great Leipsic Cantor was looked on, in Mendelssohn's words, as "a mere old-fashioned big-wig stuffed with learning." That work opened the eyes of the musicians to their colossal stupidity, and from that year to the present time Bach's fame has been growing in a steady crescendo. In 1851 a Bach Society was formed at Leipsic for the printing of a monumental edition of Bach's works by Breitkopf and Härtel. For nearly half a century (up to 1896) a huge folio volume was issued every year, and after its completion the Bach Society began to make efforts for multiplying performances of these works, the majority of which constitute even now an unsurveyed Klondike. Bach himself does not appear to have been chagrined by the neglect of his works during his lifetime. "We find in him," writes Abdy Williams, "little of that desire for applause, for recognition, which is usually one of the strongest motives in an artist. He was content to labor as few men have labored, in a remote corner of Germany, simply for art and art alone." To cite Bach's own words: "The sole object of all music should be the glory of God and pleasant recreation." At the same time, it is obvious that he would have been gratified if he had won, as composer, some of the honors which fell to him abundantly as player. Of the esteem in which he was held as organist and clavichordist, two anecdotes give the best illustration. In 1717, while on one of his concert tours, he happened to be in Dresden at the same time as the famous French organist and harpsichord player Marchand. The Dresdeners thought this was a good chance for an international contest, and Bach was induced to offer the Frenchman a challenge. It was accepted, and all the details had been arranged; but when the hour arrived there was no Marchand. He had taken "French leave" that morning on the fast coach! Many years later, in 1747, Bach accepted a repeatedly given invitation to visit Frederick the Great at Potsdam. The king was delighted to see him. Without allowing him to take off his traveling clothes, he made him improvise on all his pianos and organs in his palace, and again and again he exclaimed: "There is only one Bach!"

It has been said of Bach that music owes almost as much to him as a religion does to its founder. This is true especially of two branches — the organ and choral music. Both as a writer for the organ and a player he has had no equal. The best account of this phase of his art is contained in Pirro's 'Bach, the Organist, and his Works for the Organ;' the author's aim being to make it easier to play Bach "in the Bach spirit." He refers to the great composer as "the man who suddenly surpassed all that had been done before him while at the same time anticipating all that was to be written in the future." The organ works are contained in vols. XV, XVII, XXXVIII, and XL of the Breitkopf and Härtel edition. Some of them are best known to music lovers through their superb arrangements for pianoforte by Liszt, Busoni, and others. Quite as striking is Bach's pre-eminence in choral music. The vocal works make up more than 30 vols.; among them there are 4 of chamber music with voice, 9 of passions, oratorios, and masses; and no fewer than 17 of church cantatas. It is known that he wrote 5 complete sets of these cantatas for all the Sundays and holidays in the year; probably there were about 350 in all, but of those only about 200 have been preserved. The greatest choral works in existence are Bach's 'Saint Matthew Passion' and his Mass in B minor. Schumann preferred the 'Saint John Passion' even to the Saint Matthew. Three other passions written by Bach are lost. Concerning this class of works Wagner exclaimed: "What opulence, what fullness of art, what power, clearness, and withal simple purity, speak to us from these unrivaled masterworks!" They are made up of arias, recitatives, chorals, and other choruses, beside the instrumental accompaniment. The arias are sometimes embroidered after the fashion of the time, but usually they are simple, chaste, and delightfully melodious. Indeed, Bach was so full of melody that it overflows into his recitatives, which are, at the same time, often highly dramatic and emotional, foreshadowing Wagner's. If Bach had written operas they would have been more dramatic than Handel's; but the opera was (apart from the *Lied,* or lyric art song, which had not yet been created), the one form of music which Bach avoided. As for the choruses in his works, they are of incomparable grandeur, and at the same time of great difficulty. All the parts are melodious; indeed there is in these works little practical difference between the chorus singers and the soloists. Many of the choruses are stately chorals — the hymns introduced into the Church by Luther and perfected by Bach. These were sung by the trained choir, the harmonies being too elaborate for the congregation. In his own churches Bach found the means of execution lamentably inadequate. The singers and students could barely master the technique; of the inner spirit they had no conception.

Of Bach's orchestral scores, also, it may be said that all the players are, in turn, soloists. His harmony is "a manifold melody;" it forms the bridge between the mediæval polyphonic and the modern harmonic styles. In his orchestral accompaniments, a favorite device is an *obligato* part for some string or wind instrument playing a duet with the solo voice. His

works for orchestral instruments alone comprise three overtures and six concertos. Among his compositions for violin there are three suites and three sonatas that are unique, inasmuch as they have no pianoforte accompaniment but are complete in themselves, the polyphonic or harmonic accompaniment being played together with the melody by the violinist; for the violincello, also, there are six sonatas and suites of this kind. While it is true that in all of his works the organ style prevails more or less, there is nevertheless a keen instinct (far ahead of the time in which he lived) for what is idiomatic, or peculiar to each instrument. This is particularly true in regard to the pianoforte compositions. In these, Bach is more modern than Haydn, Mozart, or even Beethoven. While writing for the imperfect clavichords and harpsichords of his time he had in his mind a prophetic vision of the modern grand piano; on that alone can justice be done to his superb compositions of this class. His preludes and fugues, his inventions, suites, toccatas, fantasias, etc., are the fountain head of modern music. Of special importance is the 'Well-tempered Clavichord,' a collection of 48 preludes and fugues, two in each key, arranged in the order of chromatic ascent. Hans von Bülow called this "the Old Testament in music." It is indispensable to every student; but it is infinitely more than a group of studies. "We find these fugues," wrote Rubinstein, "of a religious, heroic, melancholy, grand, serious character; in one respect only are they all alike — in their beauty! And then the preludes, whose charm, variety, perfection, and splendor are simply incomparable! That the same composer who wrote those organ compositions of overwhelming grandeur could also write such delightfully humorous gavottes, bourrées, gigues, such melancholy sarabandes, short piano pieces of such charming simplicity, transcends belief. These remarks refer to his instrumental works alone, but if we add to them his gigantic vocal compositions, we are led to the conclusion that the time will come when it will be said of Bach as of Homer: 'This was not written by one man but by several.'" Rubinstein's reference to the gavottes, etc., calls attention to the fact that Bach was not above writing dance music; a great deal of it, in fact. He also did much to improve the technique of pianoforte playing, especially in the matter of fingering (use of thumbs). He would have been the first to adopt all modern improvements, and in playing him, therefore, the pedal, for instance, should be used as freely as in playing Chopin. And while it was not customary in Bach's day to write expression marks, it is idiotic to suppose that he played his pieces without changes in loudness and pace. Here students should follow the guidance of Liszt and Bülow. The more Bach's works are studied from this point of view, the more does he seem a modern romanticist, and his works music of the future, even more than music of the past.

Bibliography.— Spitta's 'Bach,' in 2 vols. (English by Bell & Maitland) is the most elaborate and authoritative work. Of shorter books the most serviceable is that by Abdy Williams, which also contains a classified list of Bach's works and a bibliography. Consult also Parry: 'The Evolution of the Art of Music;' Apthorp: 'Musicians and Music Lovers;' and vol. IV of the 'Oxford History of Music;' 'The Age of Bach and Handel' by Fuller Maitland.

HENRY T. FINCK,
Musical Critic 'Evening Post,' New York.

Bach, Karl Philipp Emanuel, German musician: b. Weimar, 14 March 1714; d. 14 Dec. 1788. He was the son of Johann Sebastian Bach and was court musician in the service of Frederick the Great in 1740–67. He wrote on the theory of piano playing and was a voluminous composer of piano music, oratories, etc.

Bacharach, bäH'a-raH, a town of Germany, situated on the Rhine, 12 miles south of Coblenz. The vicinity produces excellent wine, which was once highly esteemed. The view from the ruins of the castle is one of the sublimest on the Rhine. Pop. (1900) 1,904.

Bache, bāch, **Alexander Dallas,** American scientist: b. Philadelphia, Pa., 19 July 1806; d. 17 Feb. 1867. He was graduated from the United States Military Academy, at the head of his class, in 1825; became professor of natural philosophy and chemistry at the University of Pennsylvania in 1828; was the organizer and first president of Girard College, 1836, where he established a magnetical and meteorological observatory, and was appointed superintendent of the United States Coast Survey, in 1843. In the last office he performed services of lasting and invaluable character. He was regent of the Smithsonian Institution in 1846–67; an active member of the United States Sanitary Commission during the Civil War; and president of the National Academy of Sciences in 1863. Besides a long series of notable annual reports of the United States Coast Survey, he published a report on 'Education in Europe' (1839), and 'Observations at the Magnetic and Meteorological Observatory at the Girard College' (3 vols. 1840–47).

Bache, Benjamin Franklin, American surgeon: b. 1801; d. 1881. He was great grandson of Benjamin Franklin. He established a laboratory in New York which during the Civil War was of great service to the Federal army.

Bache, Franklin, American chemist: b. Philadelphia, 25 Oct. 1792; d. 19 March 1864. He was appointed professor of chemistry at the Philadelphia College of Pharmacy in 1831, and at the Jefferson Medical College in 1841. He published 'System of Chemistry for Students of Medicine' (1819), and was one of the authors of Wood & Bache's 'Dispensatory of the United States' (1833).

Bache, George M., American naval officer: b. in the District of Columbia, 12 Nov. 1840; d. 11 Feb. 1896. He was graduated at the United States Naval Academy, in 1860, and commanded the ironclad Cincinnati in the various engagements on the Mississippi River, until she was sunk by the Vicksburg batteries, 27 May 1863. He was highly commended by Admiral Porter, Gen. Sherman, and Secretary Welles for his conduct in the last engagement. Subsequently, he took part in both attacks on Fort Fisher, and, in the second one, 15 Jan. 1865, led the naval assault on the fort. He was retired with the rank of commander, 5 April 1875.

Bache, Hartman, American military engineer: b. Philadelphia, Pa., 3 Sept. 1798; d. 8 Oct. 1872. He entered the United States

Topographical Corps; and for 47 years was constantly employed on surveys and on works of hydrographic and civil engineering. On 13 March 1865 was appointed brigadier-general, and 7 March 1867 was retired. His most notable achievements were the building of the Delaware breakwater and the application of iron-screw piles for the foundation of lighthouses upon sandy shoals and coral reefs. He retired from active service, 1867.

Bache, Sarah, American philanthropist: b. Philadelphia, Pa., 11 Sept. 1744; d. 5 Oct. 1808. She was the only daughter of Benjamin Franklin, and the wife of Richard Bache. During the Revolutionary War she organized and became chief of a band of patriotic ladies who made clothing for the soldiers, and in other ways relieved their sufferings, especially during the severe winter of 1780.

Bache, Walter, English pianist: b. Birmingham, 19 June 1842; d. London, 26 March 1888. In 1858 he studied music in the Leipzig Conservatorium under Hauptmann, Richter, Plaidy, and Moscheles. In 1862 he went to Rome, and from that time till 1865, when he returned to London, studied with Liszt, of whose style and compositions he became an ardent admirer and advocate. Upon his return to London he instituted annual concerts, at which he put forward Liszt's music, and lived long enough to see the indifference of the public toward his master change to open admiration. For several years prior to his death Bache was professor of the pianoforte at the Royal Academy of Music, and it was mainly due to his efforts that the Liszt scholarship was established in that institution.

Bachelder, Nahum Josiah, American statesman; b. Andover, N. H., 3 Sept. 1854. Educated at Franklin Academy, Taunton Hill School, Andover; and became prominent farmer. Was nominated by the Republicans and elected governor of New Hampshire in 1902.

Bacheller, Addison Irving, America novelist: b. Pierpont, Saint Lawrence co., N. Y., 26 Sept. 1859. He was graduated at the Saint Lawrence University in 1882, from 1882–3 was a member of the staff of the *Daily Hotel Reporter* of New York city, and in 1884 became a reporter for the Brooklyn *Times*. In the latter year he established the Bacheller Syndicate for the purpose of supplying literary matter to periodicals, and for 14 years was a director of that syndicate. He was for a short time editor of *The Pocket Magazine,* and subsequently joined the editorial staff of the *New York World,* but remained in that capacity for a short time only. His novels, the scenes of which are laid in northern New York, include: 'The Master of Silence' (1890); 'The Still House of O'Darrow' (1894); 'The Unbidden Guest;' 'Eben Holden' (1900); 'D'ri and I' (1901); 'Darrel of the Blessed Isles' (1903); 'Candlelight' (1903); 'Virgilius' (1904); etc.

Bach'elor, a term anciently applied to a person in the first or probationary stage of knighthood who had not yet raised his standard in the field. A knight bachelor is one who has been raised to the dignity of a knight without being made a member of any of the orders of chivalry such as the Garter or the Thistle. It also denotes a person who has taken the first degree in the liberal arts and sciences, or in divinity, law, or medicine, at a college, or university; or a man of any age who has not been married, the most usual meaning of the term. Taken as a class in a community, bachelors have, from the earliest times, been the subjects of much and varied legislation. In nearly every country, at some period in its history, penalties have been imposed upon male celibates through the legislative branch of the government, the general basis for such legislation being the principle that the citizen was under moral obligation to the State to rear up a family of legitimate children, at least should he be capable, morally, physically, and financially. The old Jewish command to "be fruitful and multiply" was faithfully carried out by the Hebrews who regarded marriage as a duty.

In such nations as Sparta, where individual interests were always subservient to those of the State, the laws were more severe, and criminal proceedings were instituted, under the laws of Lycurgus, both against those who for any unreasonable excuse failed to marry, and against those who through marriage in late life made probable children of unhealthy constitution. At Athens, though formerly regarded as a crime by the laws of Solon, celibacy was not severely punished, and later, though the practice was discouraged, interference with the inclinations of individuals in this respect gradually became of little practical value, and the laws finally fell into disuse.

In Rome, the imposition of heavy penalties upon male celibates was instituted at a very early period, and later even women were subjected to the same rigid laws. According to the *Lex Julia et Papia Poppæa,* penalties were imposed on those who failed to marry after a certain age, and an unmarried person could not come into possession of a legacy unless he be married within a hundred days after the testator's death. The provisions of the law allowed widows a year in which to comply, and divorced women six months from the date of divorce, but these periods were later changed and extended to two years, a year and six months, respectively. This law did not apply, however, to men above 60 years of age, and women above 50 years. In cases of childless persons (males from 25 to 60 years of age, and females from 20 to 50 years) who should become beneficiaries under a legacy, one half of the value of such legacy was forfeited. In later years, especially in England, France, and the United States, taxes upon bachelors have been imposed more for purposes of State revenue than to compel marriage, but though such legislation has been pushed in some instances with great vigor, the success of the movement in later years has not been marked.

Bach'elor, a local name in the Mississippi valley for the small bass, more usually called crappie (q.v.).

Bachelor's Button, the double yellow buttercup (*Ranunculus acris*). Similar forms, as *R. aconitifolius,* are often called white bachelor's buttons. The name is also given to *Centaurea cyanus* (see CORNFLOWER) and to *Gomphrena globosa.*

Bachian, băch-yän', one of the Molucca Islands, immediately south of the equator, and southwest of Gilolo; area, 800 square miles. It is ruled by a native sultan under the Dutch.

Bachman, bäk'man, **John,** American clergyman and naturalist: b. Dutchess County, N. Y., 4 Feb. 1790; d. 25 Feb. 1874. He became pastor of a Lutheran church in Charleston, S. C., and published among other works, 'Characteristics of Genera and Species as Applicable to the Doctrine of the Unity of the Human Race' (1854). He is best known by reason of his association with Audubon in the making of the 'Quadrupeds of North America,' he writing the principal part of the text, which Audubon and his sons illustrated.

Bachmut, bach-moot', a town of southern Russia, in the government of Ekaterinoslav, with a trade in cattle and tallow. It has coal mines and salt wells, and soda is extensively manufactured. The salt produced here is of a very high grade of excellence. Pop. (1897) 19,400.

Bacil'lus. See BACTERIA.

Back, Sir George, English explorer: b. Stockport, 6 Nov. 1796; d. London, 23 June 1878. He entered the British navy in 1808, and in 1817 was in the expedition to Spitzbergen. He accompanied Sir John Franklin to the Arctic regions in 1819 and again in 1825, and in 1833 led a party in search of Sir John Ross, then in the Arctic Ocean, and in 1836, in command of the Terror, made his last trip to the north. The Geographical Society awarded him a gold medal in 1837, and in 1839 he was knighted. He became admiral in 1867. Among his works are 'A Narrative of the Arctic Land Expedition' (1836); a 'Narrative of the Expedition in Her Majesty's Ship Terror' (1838).

Back Bay, a fashionable residential district in Boston, made by filling in an enlargement of the Charles River, formerly called the Back Bay. See BOSTON.

Back Land, name applied to the region around the Arctic Circle, in British North America. It was explored by Capt. Back in 1831.

Back-Staff, an instrument invented by Capt. Davies, about A.D. 1590, for taking the altitude of the sun at sea. It consisted of two concentric arcs and three vanes. The arc of the longer radius was 30°, and that of the shorter one 60°; thus both together constituted 90°. It is now obsolete, being superseded by the sextant.

Back'bite, Sir Benjamin, an evil-minded, sharp-tongued character in Sheridan's comedy, 'School for Scandal.'

Back'gam'mon is a game in which two opposing players move symbolic men into or out of each other's territory on a board, according as they are respectively entitled to do so by the throw of a dice. Without question a game of that nature was played among the Aztecs of Mexico centuries before the landing of Cortez, and it is probable that it was brought from Asia to the Pacific coast by the original immigrants. Francisco Lopez de Gomara described it in 1552, and Joan de Torquemada in 1616 gave additional details of the game, mentioning that the little stones of each contestant varied in color. The Iroquois Indians had a dice game of a somewhat similar sort.

Modern backgammon is played by two players who have between them a board, each side of which has alternate black and white angular marks projecting like rays from the rim. Each player has 15 flat tablets (similar to those with which drafts is played) called men. One player's men are black, the others are white. Each player has a dice box for his own use but the two dice are used alternately by them both. Each dice has a number on each face numbered from one spot to six. Each player throws the dice in turn on to the centre of the board: and moves two men, one man according to the distance indicated by one of the dice and the other according to the number on the second dice. So the game proceeds in the usual manner, the players throwing and moving their men alternately into and out of each other's territory, until one player has carried all the men from the opposite home (or inner table) into the outer table: and thence into his own outer table and finally into his own home or inner table. The simplest text-book on the subject is that of A. Howard Cady.

Backhuysen, bäk'hoi-zen, or **Bakhuysen, Ludolf,** celebrated painter of the Dutch school, particularly in sea pieces: b. Emden 18 Dec. 1631; d. 1709. His most famous picture is a sea piece which the burgomasters of Amsterdam commissioned him to paint as a present to Louis XVI., and which is still at Paris.

Bäckström, bĕk'strėm, **Per Johan Edvard,** Swedish dramatist and lyric poet: b. Stockholm, 27 Oct. 1841; d. 13 Feb. 1886. His principal work is 'Dagvard Frey' (1876), a tragedy; besides this, the dramas 'A Crown' (1869); 'Eva's Sisters' (1869), and 'The Prisoner of Kallö' (1870), met with success. His lyrics were published in three collections (1860, 1870, 1876).

Back'us, Azil, first president of Hamilton College, Clinton, N. Y.: b. Norwich, Conn., 13 Oct. 1765; d. 9 Dec. 1817. After graduating at Yale in 1787, he served the Church at Bethlehem, Conn., until he became president of Hamilton College in 1812.

Back'us, Isaac, Baptist clergyman and author: b. Norwich, Conn., 9 Jan. 1724; d. 20 Nov. 1806. He was ordained 13 April 1748 and became pastor of a Congregational church in Middleborough, Mass. Some of his congregation sympathizing with the Baptists he united with them and formed a Baptist church in 1756. Throughout his life he was a persistent advocate of the widest religious freedom, holding open communion for many years. For 34 years he was a trustee of the present Brown University, then Rhode Island College. As a delegate to the convention that adopted the Federal constitution, he voted in its favor. Of his numerous writings the most important is 'A History of New England with Special Reference to the Baptists' (3 vols. 1777–96; new ed. by D. Weston, 2 vols. 1871), a partisan but valuable work. His 'History of Middleborough' is in Massachusetts Historical Society Collections (Vol. III., 1st Series, 1794; repr. 1810).

Back'us, Truman Jay, American educator: b. Milan, N. Y., 11 Feb. 1842; was graduated at the University of Rochester in 1864; was professor of English literature at Vassar College, 1867–83; then became president of the Packer Collegiate Institute in Brooklyn, N. Y. After going to Brooklyn, he served on

several state commissions. His publications include 'Great English Writers,' 'Outlines of English Literature,' and a revised edition of Shaw's 'History of English Literature.'

Ba'con, Alice Mitchell, American educator: b. New Haven, Conn., 26 Feb. 1858; was educated privately and took the Harvard examinations in 1881; taught at the Hampton Normal and Agricultural Institute in 1883-8, and in Tokio, Japan, in 1888-9; returned to the Hampton Institute in 1889, and founded the Dixie Hospital for training colored nurses in 1890. In 1900 she again began teaching in Tokio. She published 'Japanese Girls and Women,' 'Japanese Interior,' etc.

Bacon, Augustus Octavius, American legislator: b. Bryan County, Ga., 20 Oct. 1839. He was graduated from the University of Georgia in 1859, from the law department of the university in 1860; entered the army of the Confederate States at the beginning of the Civil War, and was adjutant of the 9th Georgia regiment in the Army of Northern Virginia, and later promoted captain and assigned to general staff duty; and in 1866 began the practice of law at Macon, Ga. In 1880 he was president of the State Democratic convention, and in 1884 a delegate from the State at large to the national Democratic convention. He was a member of the Georgia house of representatives in 1871-82, 1892, and 1893, and for the greater part of the time its speaker. Elected to the United States Senate in November 1894, he was re-elected in 1900.

Ba'con, Benjamin Wisner, American educator: b. Litchfield, Conn., 15 Jan. 1860; studied in Germany and Switzerland; and was graduated at Yale College in 1881; held several Congregational pastorates; and in 1896 became professor of New Testament criticism and exegesis in Yale University. Author of 'Genesis of Genesis'; 'Triple Tradition of the Exodus'; 'Introduction to the New Testament'; 'The Sermon on the Mount' (1902); 'The Story of Saint Paul' (1904); etc.

Ba'con, Delia Salter, American author: b. Tallmadge, O., 2 Feb. 1811; d. 2 Sept. 1859. She was eminent in her day as a teacher, and wrote several stories, but is now remembered only as an eloquent advocate of the theory that the plays of Shakespeare were written by Lord Bacon. She herself did not originate the idea, but was the first to give it any currency, in her 'Philosophy of the Plays of Shakespeare Unfolded' (1857). The book had the honor of a preface from the pen of Nathaniel Hawthorne, and the theory has been accepted by a few persons in both England and the United States, who have wasted not a little ingenious reasoning in its advocacy.

Ba'con, Edwin Munroe, American author: b. Providence, R. I., 20 Oct. 1844. He received an academical education; was on the staff of several Boston papers; and wrote 'King's Handbook of Boston'; 'Boston Illustrated'; 'Historic Pilgrimages in New England'; 'Literary Pilgrimages in New England'; 'Boston of To-day'; 'Bacon's Dictionary of Boston'; 'Walks and Rides in the Country Round About Boston'; 'Walks on the North Shore'; 'Massachusetts Bay' (1903); etc.

Bacon, Francis, English statesman, philosopher, and essayist: b. London, 22 Jan. 1561; d. Highgate, London, 9 April, 1626. Bacon was commonly called Lord Bacon in accordance with long literary tradition, though his exact titles in the peerage were Baron Verulam and Viscount Saint Alban. He was the youngest of eight children of Sir Nicholas Bacon, the Lord Keeper, six of whom were by a former marriage. His mother was Ann, daughter of Sir Anthony Cooke, and her sister married Sir William Cecil (Lord Burghley). The family thus stood in a position of exceptional influence at the court of Elizabeth, but Bacon profited little by the fact in his official career. He entered Trinity College, Cambridge, in 1573 and was admitted to Gray's Inn in 1575. In 1576 he went to France as a member of the embassy of Sir Amias Paulet, and remained there until the death of his father in 1579. It then became necessary for him to return to England and take up his legal studies with a view to professional practice. In 1582 he was admitted utter barrister. Already before this time he had entertained hopes of a political career and had made unsuccessful appeals to Lord Burghley for support; and in 1584, being elected to Parliament from Melcombe Regis, he began a long and conspicuous service in the House of Commons. He produced at once a political document, entitled 'A Letter of Advice to Queen Elizabeth,' in which the religious situation, and particularly the Catholic question, was discussed with wisdom and moderation. In 1589 he wrote a second paper, 'An Advertisement Concerning the Controversies of the Church of England,' reiterating his policy of moderation with more especial reference to Puritanism. Bacon's natural instinct, in both religious and political controversies, was conciliatory, and he exerted himself in favor of moderate measures throughout Elizabeth's reign and after the accession of James. He manifested also, at the beginning of his career, some power of acting with disinterested independence,—a capacity which was less evidently displayed in his later life. In 1593 he led the opposition of the Commons to the proposal of the Lords for a joint settlement of a question involving subsidies and thus falling within the prerogatives of the Lower House. In his prolonged resistance to the subsidy legislation he earned the disfavor of both Burghley and the Crown. His opposition, which was apparently conscientious, may have been the cause of his failure to obtain the vacant attorney-generalship in 1594 and the solicitor-generalship in 1595, though in the former instance his claim was urged by Essex and in the latter by both Essex and Burghley. The attorney-generalship was given to Sir Edward Coke, who was repeatedly a rival and enemy of Bacon's in later years.

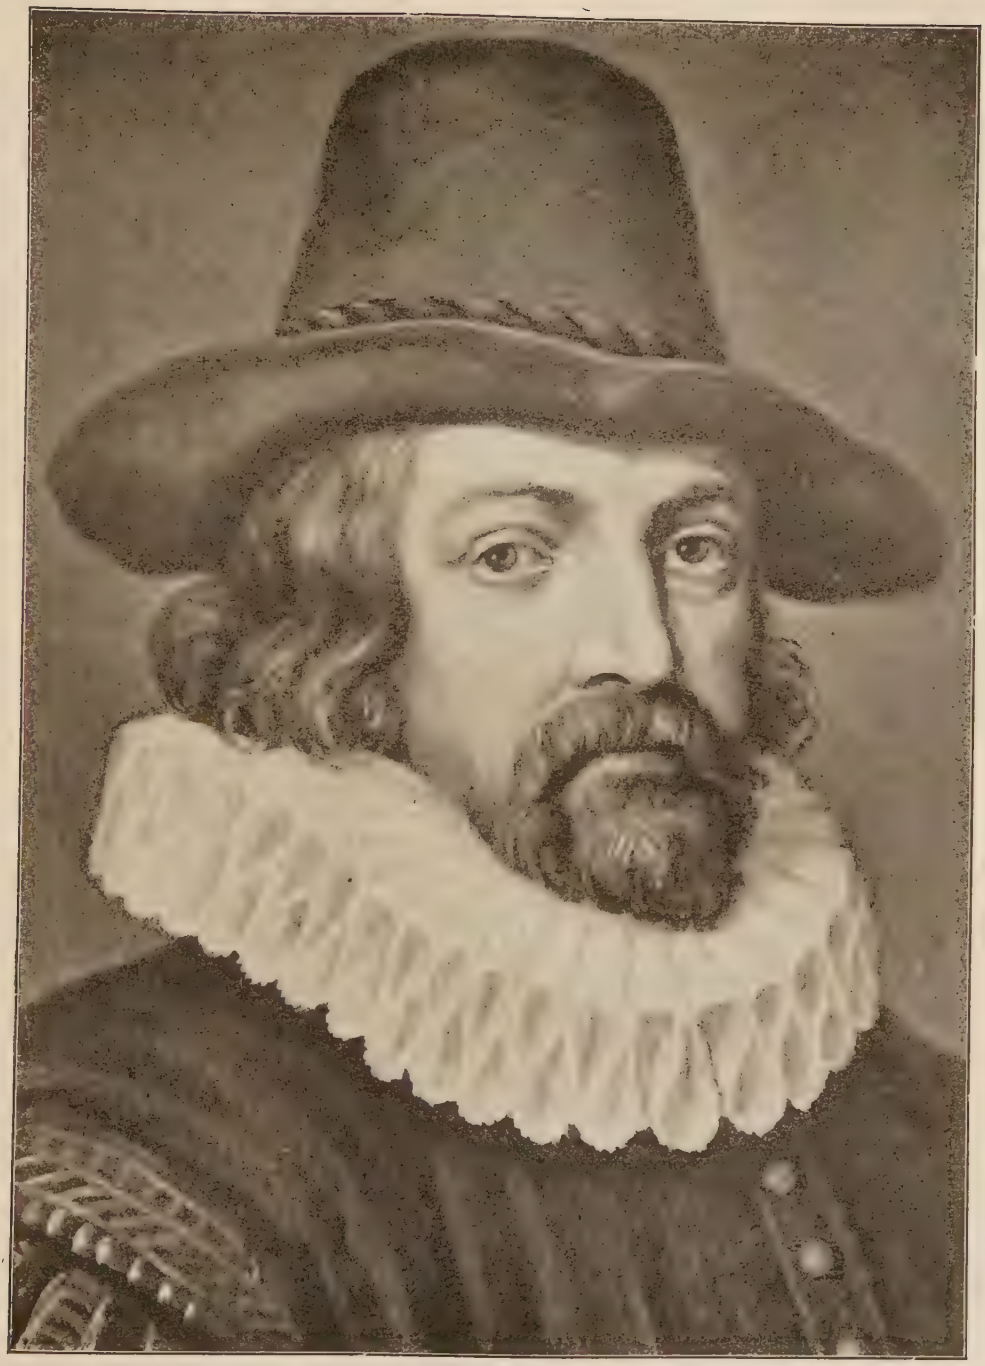
Bacon's association with Essex, which constituted one of the most important of his personal relations, began in 1591. He attached himself to the rising young nobleman in the hope of obtaining political advancement. But it is not necessary to deny him all sentiment of personal attachment or all real belief in the availability of Essex for the public service. He received from Essex earnest patronage, as has been already shown, and when recommendations

failed, Essex gave his follower a valuable estate by way of consolation. In 1597 Essex tried to arrange a marriage between Bacon and Lady Hatton, but Coke again proved a successful rival. Bacon, on his side, undertook to advise Essex and to manage his career at court. In 1598 he appears to have urged him (though he afterward denied it) to attempt the suppression of Tyrone's Irish rebellion,—an undertaking which led to the dismissal of Essex from office in disgrace. Bacon's conduct in the investigation is hard to trace, but he may perhaps be granted to have acted in the interests of Essex, though he was formally one of his prosecutors. Later, however, in 1601, when Essex rebelled openly against the throne, Bacon helped to secure his conviction, and after his execution prepared the official declaration of his treasons. For this active, and apparently unnecessary, participation in the prosecution of his friend Bacon has probably received more blame than for any other act of his life. It may be urged in extenuation that Essex was actually a dangerous person to the state, and that Bacon steadily warned him that he would not prefer the claims of friendship to the public good. It is true, too, that Bacon's position was difficult as between such a reckless friend and the jealous and imperious queen whose favor he desired both for his friend's interest and his own. Yet in the last analysis there is little defence to be made for Bacon's willingness to profit by the ruin of Essex.

After the accession of James I. Bacon continued his active service in Parliament. He published papers on the religious situation and on the union of the English and Scottish crowns, and he served on a commission to arrange the terms of the union. In 1603 he was knighted, and in 1604 given a pension of £60. In 1605 he offered to King James the very important treatise on the 'Advancement of Learning,' which will be more particularly discussed below among Bacon's writings. In 1606 he married Alice Barnham, a London alderman's daughter, who brought him a substantial dowry. He had no children. Little is known of his domestic life except that it ended unpleasantly. In his last will he revoked "for just and grave causes" such provisions as he had made earlier for his wife's benefit. In June, 1607, Bacon's long-deferred advancement came and he was made solicitor-general. At this period the unfortunate estrangement between the King and the Commons was steadily progressing, and Bacon, who clearly saw the danger that attended upon this breach of sympathy, took an earnest part in the struggle. Quite apart from his personal aims, he seems to have been genuinely distrustful of the governmental capacity of the Commons and consequently to have espoused the cause of the monarchy, becoming, as he described himself, a "peremptory royalist." His policy was doomed to failure; but it is only just to recognize that it had elements of moderation and statesmanship, contemplating to be sure the royal prerogative, yet aiming at religious toleration, the amelioration of the lot of the humbler classes, and a friendly relation with parliament. After the death of Salisbury in 1612 he undertook to manage the King's interests, and in the parliament of 1614 he continued his efforts to reconcile the crown and the people by the policy to which in his 'Commentary' he gives the name "e Gemino." But his attempt was unsuccessful; the parliament was dissolved, and the King and the people took different courses. From this time forth Bacon seems on the whole to have relinquished his higher political aims and to have given himself over to the struggle for personal advancement. In politics, as in friendship, he was incapable of serious self-sacrifice; or at least he always persuaded himself that he could best serve the public good by having due regard to his own interests.

In 1613 he had been promoted to the attorney-generalship. In 1615 he prosecuted Saint John for denouncing benevolences, and in the same year he consented to the torture of Edmund Peacham, who was charged with having written a treasonable sermon. He came in the latter case into conflict with his old enemy, Coke, who denied Peacham's guilt, and who also objected to the separate consultation of the judges by the attorney-general. In 1617 Bacon helped to secure Coke's removal from the King's Bench for insufficient subserviency to the Crown. Coke's personal independence throughout the controversy has been often praised, and stands in favorable contrast with Bacon's self-seeking policy. At the same time it should be remembered that there was involved a real issue between the legal and the political powers, and that Bacon, in resisting Coke's effort to make the court an arbiter of the constitution, was fighting for the principle which actually prevailed, though under changed conditions, in English government.

Bacon took part in 1616 in the prosecution of the Earl of Somerset for the murder of Sir Thomas Overbury, and after Somerset's fall he attached himself with ardor to George Villiers, the King's new favorite, in whom he seemed, along with many others, to be for the time genuinely deceived. Through Villiers (afterwards Earl and Duke of Buckingham) Bacon received a succession of royal favors. In 1616 he was made Privy Councillor, in 1617 Lord Keeper, and in 1618 Lord Chancellor. In July 1618 he was elevated to the peerage as Baron Verulam, and in 1621 he was made Viscount St. Alban. But his adherence to Buckingham, who was growing steadily unpopular, led at last to disaster. In 1621 the Commons, led by Coke, would have called Bacon to account for defending Buckingham's increase of monopoly patents, if the King had not interfered. Thereupon they sent to the Lords a formal accusation that Bacon had taken bribes from suitors in his court. Bacon at first treated the charges with unconcern. Then, when he found that the Lords meant to investigate them seriously, he collapsed and offered no defense. He was fined £40,000, imprisoned, and banished from parliament and the court. In June, 1621, he was released from the Tower, and retired to his family residence at Gorhambury; and in September of the same year the King pardoned him, though without restoring him to parliament and the court. Bacon begged both James and Charles without avail for a further remission of his penalty. While admitting the justice of his condemnation, he protested that there had been no juster judge in England for 50 years; and there is of course



FRANCIS BACON.

an important difference between corruption and perversion of justice. Although he constantly accepted gifts from suitors while their cases were pending, it does not appear that he ever perverted justice for money, and some of the cases urged against him were those in which the suitors had lost after giving him gifts. But this record is not so clear in cases where Buckingham interposed to ask favor for his friends, and in at least one instance he allowed a decision of his court to be practically set aside at the Favorite's request.

Forbidden to re-enter the field of politics, Bacon devoted the last years of his life to the literary and scientific labors which had always divided his time and which he had professed to regard as his real and proper work; and he met his death as a result of a scientific experiment. In March, 1626, he caught cold while stuffing a fowl with snow in order to observe the effects of refrigeration on the preservation of meat. On 9 April he died of what is now known as bronchitis at the house of Lord Arundel, where he had been carried at the time of his attack. He was buried in Saint Michael's church, Saint Albans.

Bacon's Writings.—From early youth, if tradition can be trusted, Bacon showed extraordinary mental powers and a keen interest in philosophical pursuits. Throughout his life his labors in authorship kept pace closely with his political work, and prone as he was to yield to the temptations of wealth and power, he seems really to have accorded the first place in life to what he called his "contemplative aims." His strictly philosophical writings may therefore properly claim first attention among his works. At the age of 23 he produced an essay which bore the ambitious title, 'The Greatest Birth of Time, or the Great Renewal of the Empire of Man Over the Universe.' The work is now lost, but the title shows that the young author had already conceived some notion of a "great instauration." The 'Partus Masculus Temporis' ("The Male Birth of Time"), a fragment which is also of early date, is perhaps a modification of previous work. It contains little more than an attack on the false fancies ("idols") of the older philosophies, and is Bacon's first plea for a lawful wedlock between the mind of man and the universe. The 'Conference of Pleasure' (written for Essex in 1592), 'Gesta Grayorum' (1594), and the 'Device on the Queen's Day' (1595) are not primarily philosophical works, but they contain many expressions of Bacon's intellectual ideals; and in the 'Gesta Grayorum' there is an elaborate proposal for the endowment of libraries, museums, and establishments of research. 'Valerius Terminus, of the Interpretation of Nature, with the Annotations of Hermes Stella' (written about 1603) is a fragmentary treatise anticipating some of the most familiar matter in the later philosophical works. In it Bacon defends the study of science from the charge of impiety, urges the importance of an encyclopædic survey of human knowledge, and mentions for the first time (though without explaining them) the four classes of "idols" which were afterward discussed in the 'Novum Organum.' In 1605 Bacon presented to King James an English treatise of enduring value, 'The Advancement of Learning.' This was a splendid attempt to defend and magnify the pursuit of learning and then to survey the existing state of human knowledge. Part of the argument of the first part has lost its cogency, or even its relevancy, to-day. But in breadth of view and fertility of suggestion the work is extraordinary. As a statement of intellectual ideals, and a programme, or even a prophecy, of their accomplishment, it stands among the most significant productions of the Renaissance. When Bacon sketched a few years later the plan of his 'Great Instauration,' he designated the 'Advancement of Learning,' as a temporary filling of the first place on the "partitiones scientiarum," and in his last years he made a greatly amplified Latin translation of it ('De Augmentis et Dignitate Scientiæ') to be incorporated in the great work. In 1606-7 he published the 'Outline and Argument' ('Delineatio et Argumentum') of the second part of the Instauration, giving a brief general account of his new induction. In 1607 the 'Cogitata et Visa de Interpretatione Naturæ, sive de Scientia Operativa' were published as an introduction to some investigations on motion. The 'Cogitata' cover most of the ground afterwards traversed in the first book of the 'Novum Organum.' The 'Redargutio Philosophiarum' (1609), one of the best specimens of Bacon's Latin style, contains an imaginary speech of a French philosopher to his disciples, and sets forth anew the author's ideas about the fruitlessness of the older philosophies. The 'De Sapientia Veterum,' though it lies outside the immediate scheme of the 'Instauration' and might perhaps be mentioned rather among Bacon's literary works, is a very characteristic production containing an exposition of his theory of ancient mythology as an allegorical embodiment of moral and scientific wisdom. This primitive wisdom he was fond of extolling to the disparagement of the later philosophy of Aristotle, against which he was in revolt. In 1611 and 1612 fall a number of scientific treatises of less importance. Not until 1620, after his long struggle to political power and on the eve of his fall, did Bacon publish the 'Novum Organum,' though much of its material had been anticipated in his earlier writings. Prefixed to the work is a "distributio operis" for the whole 'Instauration,' which was planned to contain the following parts: 1. Partitiones Scientiarum (represented temporarily by the English 'Advancement of Learning'); 2. Novum Organum (the new instrument or inductive method); 3. Phænomena Universi; 4. Scala Intellectus (by which fanciful title he meant to indicate the operation of the new method in passing gradually from less general to more general principles "per scalam veram"); 5. Prodromi Philosophiæ Secundæ (to contain such tentative discoveries as Bacon had made without using the new method); 6. Philosophia Secunda, sive Scientia Activa (a final embodiment of the results of the new philosophy). The first book of the 'Novum Organum' was still introductory in character, discussing the uselessness of the older philosophies, the traditional errors of mankind, and the grounds of hope in the future of science. Bacon's optimistic devotion to science has been not ineptly compared with that of the young Renan. His classification of the "idols" (phantasms or delusions) of the tribe, the cave, the market-

place and the theatre, has become a literary commonplace. In the second book the new induction itself is finally expounded and illustrated by a study of the nature of heat. The exposition is incomplete and falls short, as in the nature of things it was bound to, of what Bacon himself apparently hoped to achieve, namely a mechanical method of invention. Bacon never pursued the theory further, and in his later works he turned from the new method, or instrument, toward other parts of his great scheme. The 'Parasceue ad Historiam Naturalem' (1620) is a brief and incomplete preparation for the third part of the Instauration, and was followed in 1622 by the 'Natural and Experimental History for the Foundations of Philosophy, or Phenomena of the Universe, being the Third Part of the Great Instauration.' This treatise which was to take up winds, density and rarity, gravity, sympathy and antipathy of things, and a variety of other topics, was also left in a fragmentary state. In 1623 appeared the 'De Augmentis,' which was to supersede the English 'Advancement of Learning' as the first portion of the Instauration. Probably about 1624 Bacon wrote the 'Syl a Sylvarum' (published in 1627), an ill-classified collection of materials for natural history. Its contents belong in considerable degree to the realm of folk-lore and superstition, and Bacon's detractors have found in the work some of their best grounds of attack on his character as a man of science. It was his belief, however, stated in the 'Advancement of Learning,' that a collection and comparison even of the erroneous opinions of mankind might give useful guidance in the pursuit of truth. Under the titles 'Scala Intellectus' and 'Prodromi sive Anticipationes Philosophiæ Secundæ' Bacon wrote at a later, but uncertain, date two mere prefaces which filled the fourth and fifth gaps in the 'Instauration.' They were his last philosophical writings.

Bacon's position in the history of science and of philosophy has been very differently estimated. He constructed no philosophical system, and one would search his writings in vain for much discussion of the great problems which have divided the schools of metaphysics since Descartes. As a man of science his shortcomings are still more notable. He was commonly unsuccessful in his own investigations and ill-informed about the best work of his contemporaries. He was hardly possessed at all of what is now understood by the scientific mind. Yet there is much justification for the traditional view of him as the father of modern philosophy and the primary instigator of modern scientific progress. If not the originator, he made himself at least the leading exponent of the revolt against the Aristotelian, or more properly the scholastic, tradition, and he profoundly influenced the English realists of the next generations. In ethics his distinction between «individual or self-good» and «good of communion» points forward to the doctrine of the later utilitarians. And science certainly owed him a large debt for the formulation and urgent presentation of the «new induction.» No one, of course, will maintain that Bacon invented induction. Macaulay, in his familiar account of the plain man and the minced pies, has made some sport of his claims to originality in this matter. But a more judicious estimate would recognize the high and lasting educational value of the 'Novum Organum.' And Bacon's broad outlook and fertile imagination enabled him to lay down the lines of scientific progress and to win recruits for the work. He furnished his followers not only with an improved method, but also with a more vital aim,—that of practical service. In his revolt against Aristotle and the schoolmen he constantly dwelt upon th fruitlessness of the earlier philosophies, and one of the most eloquent passages in the 'Advancement of Learning' sets forth the ideal of human service as the goal of scientific effort. This aim has come to be called Baconian, so much so that Bacon is often charged with having ignored or denied the more purely intellectual purposes. But the charge is extreme. He thought it wise, in view of the sentiment of his time to emphasize particularly the practical aim; but he recognized *veritas* and *utilitas* ('Novum Organum' I, Ap. 124) as coordinate ends of study. Finally, in spite of his deficiencies in investigation, Bacon made some noteworthy discoveries in pure science. His explanation of heat as a mode of motion is quoted by Tyndall as a striking anticipation of the modern doctrine. On the whole, however, it was as a prophet or leader, rather than as a productive scholar that Bacon served learning best.

By far the greater part of Bacon's writings (apart from his state papers, legal works, and copious personal memoranda) dealt with philosophy and science, and bore directly or indirectly upon the construction of the 'Great Instauration.' Some of his more important state papers have been already mentioned in the account of his life. His strictly professional writings (treatises on English law) will be found in the seventh volume of the Spedding and Ellis edition of his collected works. His personal memoranda, which permit an intimate view of his life and character, are published in Spedding's 'Letters and Life' (the highly characteristic 'Commentarius Solutus,' of the year 1608, in the fourth volume). Besides all these productions of his scholarship and his professional life he made eminent contributions to history and to pure letters. His 'History of Henry VII.' (1621), which has been accepted by later scholars as essentially sound, ranks with the best historical writing of its age in England. Bacon wrote also a memorial of Elizabeth ('In Felicem Memoriam Elizabethæ' (1607), another of Henry, Prince of Wales, who died in 1612, and fragments on the reign of Henry VIII. and on the accession of James I.

In pure literature Bacon's reputation rests chiefly on three works: the 'Advancement of Learning' (which has been already discussed), the 'Essays,' and the 'New Atlantis.' The first two of these, curiously enough, he translated, or had translated, into Latin in order to secure them a wider and more permanent public. The 'New Atlantis' (first published by Rawley in 1627, but probably written between 1622 and 1624), is a fragmentary sketch of an ideal commonwealth, and in particular of an ideal «palace of invention» called «Solomon's House,»—a great establishment of scientific research such as Bacon longed to see founded. The book, which expresses the idealistic spirit of the Renaissance,

shows Bacon at his best. The description of Solomon's house is said to have led to the establishment of the Royal Society. The 'Essays,' which were designed to "come home to men's business and bosoms," are better known than anything else that Bacon wrote. They deal with many subjects and are characterized by ripe reflection and consummate mastery of style. Bacon had them in hand during the greater part of his mature life. He published the first edition in 1597, and twice revised and enlarged the collection (in 1612 and 1625). The title is supposed to have been suggested by the 'Essais' of Montaigne, and there are occasional resemblances between the two works in subject-matter; but Bacon was not largely indebted to any source, and his conception of the essay was totally different from the personal and leisurely discourses of Montaigne. "Brief thoughts, set down rather significantly than curiously," was his own characterization of them in the dedication of the second edition; and although some of the later essays contain passages of adorned and sustained eloquence such as were lacking in the earlier ones, the general type was maintained to the end.

A small number of religious works, in elevated thought and style, remain to be mentioned: the 'Meditationes Sacræ' (published in 1597), the 'Confession of Faith' (written before 1603), several prayers, and Bacon's only accredited verse, 'A Translation of Certain Psalms into English Verse' (1624). A poem on 'The World,'—"The world's a bubble, and the life of man less than a span,"—is sometimes ascribed to him, but is of doubtful authorship.

Bibliography.—The dates of Bacon's chief works have been mentioned in the body of the article. The standard collected edition is that of Spedding, Ellis and Heath (London 1857-59). Single works have in several cases been published separately with more elaborate annotation; among the best of such editions being the 'Novum Organum' by T. Fowler (Oxford 1878), the 'Advancement of Learning' by W. A. Wright (Oxford 1896), the 'Essays' by Archbishop Whately (London 1856), E. A. Abbott (London 1896), and S. H. Reynolds (Oxford 1890), and the 'New Atlantis' by G. C. Moore Smith (Cambridge 1900). A useful reprint of the three editions of the 'Essays' has been published by Edward Arber, English Reprints, No. 27 (1871). For the life of Bacon the great source of original materials is Spedding's 'Letters and Life of Bacon' (7 vols., 1861). A brief digest of the material was issued in two volumes, 'The Life and Times of Francis Bacon' (Trübner 1878). Short biographies of value have been written by R. W. Church, 'Francis Bacon' (London 1884), Thomas Fowler, 'Francis Bacon' (New York 1881), E. A. Abbott, 'Francis Bacon, an Account of His Life and Works' (London 1885), S. R. Gardiner (in the 'Dictionary of National Biography'), and John Nichol, 'Francis Bacon, His Life and Philosophy' (London 1898-9). Macaulay's essay on Bacon furnishes a brilliant though by no means just or satisfactory estimate of the man and his work. On Bacon's philosophical doctrines and influence one should consult, besides the standard histories of philosophy, Ellis's general introduction to the philosophical works, Kuno Fischer's 'Francis Bacon of Verulam: Realistic Philosophy and Its Age' (Engl. translation by John Oxenford 1857), Fowler's elaborate commentary on the 'Novum Organum' and his 'Francis Bacon.' The history of Bacon's reputation and influence is treated with some fulness in Dr. Fowler's introduction to the 'Novum Organum.' An idea of the arguments of Bacon's adverse critics can be derived from Joseph de Maistre, 'Examen de la Philosophie de Bacon' (Paris, 1836), Sir David Brewster, 'Memoirs of the Life, Writings, and Discourses of Sir Isaac Newton' (Edinburgh, 1855), and Justus von Liebig, 'Ueber Francis Bacon von Verulam und die Methode der Naturforschung' (Munich, 1863).

Fred N. Robinson,
Professor of English, Harvard University.

Ba'con, Henry, American painter: b. Haverhill, Mass., 1839. He served in the Civil War, studied art in Paris under Cabanel and Edward Frere, and painted, among others, 'Boston Boys and Gen. Gage' (1875); 'Paying the Scot' (1870); and 'The Farewells' (1878).

Ba'con, John, English sculptor: b. Southwark, 24 Nov. 1740; d. 4 Aug. 1799. In early life he was employed in modelling small porcelain ornaments, and while yet an apprentice he formed a project for making statues of artificial stone. In 1763 he began to work in marble; and shortly afterward, invented an instrument for transferring the form of the model to the marble. In 1768 he became a student of the Royal Academy, and next year he obtained the first gold medal for sculpture given by that society, the following year he was chosen an associate, and in 1778 was made a full member. His chief works are two groups for the interior of the Royal Academy, the statue of Judge Blackstone for All Souls' College, Oxford; another of Henry VI. for Eton College; the monument of Lord Chatham in Westminster Abbey; and the statues of Dr. Johnson and the philanthropist Howard in Saint Paul's Cathedral.

Ba'con, John Edmund, lawyer: b. Edgefield, S. C., 3 March 1832; d. Columbia, S. C., 19 Feb. 1897. Graduated at South Carolina College, 1851; Litchfield (Conn.) Law School, and admitted to the bar, 1854. He was secretary of the United States legation at St. Petersburg, and married a daughter of ex-Gov. Pickens, then minister to Russia. He resigned in 1860, entered the Confederate army, and rose to the rank of major. He was one of the negotiators for the restoration of South Carolina to the Union, 1866; and to him was chiefly due the reopening of South Carolina College by act of the legislature in 1873. In 1886 he was appointed chargé d'affaires in Uruguay and Paraguay.

Ba'con, John Mosby, American military officer: b. Kentucky, 17 April 1844; served in the Union army through the Civil War; was appointed captain in the 9th United States Cavalry, in 1866, and colonel of the 8th cavalry in 1897. On 4 May 1898, he was appointed brigadier-general of volunteers and placed in command of the Department of Dakota. Subsequently, he was assigned to duty in Cuba, till 8 May 1899. He was retired in 1902.

Ba'con, Leonard, American clergyman: b. Detroit, Mich., 19 Feb. 1802; d. 24 Dec. 1881; graduated at Yale in 1820, after which he studied theology at Andover, Mass. In 1825 he became pastor of the First Congregational Church in New Haven, a post which he held officially, though not always actively, until his death. He was professor of didactic theology in Yale (1866–71). He was throughout his life an active opponent of slavery. In 1847 he joined with Drs. Storrs and Thompson to found the New York *Independent,* in the joint editorship of which he continued for 16 years. Besides a vast number of reviews and pamphlets, he published 'Views and Reviews' (1840); 'Slavery Discussed in Occasional Essays' (1846); and 'Genesis of the New England Churches.'

Ba'con, Nathaniel, American insurrectionary leader: b. Friston Hall, Suffolk, England, 2 Jan. 1647; d. 26 Oct. 1676. His great-grandfather was cousin to Lord Bacon; his mother, a Brooke, was daughter of a Suffolk knight. He entered St. Catherine's College, Cambridge, in 1660; took M.A. 1667; studied law at Gray's Inn, London, and traveled on the Continent. He found life too straitened in England on the income his father allowed him, and the latter gave him £1,800 outright to emigrate to Virginia, where his cousin, Nicholas Bacon, had been living since 1650. He arrived in the latter part of 1673 with a young wife, daughter of Sir Edward Duke, and soon became a member of the governor's council, as was his cousin; and settled on a plantation some 20 miles below Richmond, on the James, called «Curle's Wharf.» He also had another on a part of the site of Richmond, the attack on which by the Indians was part of the raid that brought on the imbroglio known as «Bacon's Rebellion,» which see for his career and fate.

Ba'con, Roger, English monk and philosopher: b. near Ilchester, about 1214; d. 1294. He first entered the University of Oxford, and afterward went to that of Paris, where he seems to have distinguished himself much by successful study and teaching, and received the degree of doctor of theology. About 1250 he returned to England, where he entered the order of Franciscans, fixed his abode at Oxford, and devoted himself to his studies, chiefly in natural philosophy. Means were furnished him by generous friends of science, whose contributions enabled him to purchase books, to prepare instruments, and to make the necessary experiments. In examining the secrets of nature he made discoveries and deduced results which appeared so extraordinary to the ignorant, that they were believed to be works of magic. There is clear evidence in his writings that he accepted the Aristotelian theory of stellar influence on the minds and wills of men, not indeed directly, but through the medium of the body. Such views brought him into conflict with the teachings of the Church on free will, and in 1257 he was sent to Paris, where he was kept in confinement for the long period of 10 years. In 1267, Bacon wrote a work under the title of 'Opus Majus,' giving a connected view of the different branches of human knowledge, supplemented soon after by two other works, namely, 'Opus Secundum' and 'Opus Tertium.' Under Clement's successor, Nicholas III., the general of the Franciscans, Jerome of Ascoli, declared himself against Bacon, forbade the reading of his writings, and issued an order for his imprisonment, which was confirmed by the Pope. This new confinement lasted 10 years; and when Jerome of Ascoli was elected pope, under the name of Nicholas IV., Bacon vainly endeavored to convince him of the innocence and utility of his labors, by sending him a treatise 'On the Means of Avoiding the Infirmities of Old Age.' After the death of Nicholas IV. he regained his liberty, and returned to Oxford, where he wrote a 'Compendium of Theology.'

Though an extraordinary man, Bacon could not entirely free himself from the prejudices of his time. He believed in the philosopher's stone and in astrology. There are to be found in his writings new and ingenious views on optics; for example, on the refraction of light, on the apparent magnitude of objects, on the magnified appearance of the sun and moon when in the horizon, etc. He describes very exactly the nature and effects of convex and concave lenses, and speaks of their application to the purposes of reading, and of viewing distant objects, both terrestrial and celestial; and it is easy to prove from his writings that he was either the inventor or improver of the telescope. He also gives descriptions of the *camera obscura,* and of the burning-glass. He made, too, several medical discoveries. The discovery of gunpowder has been attributed to him. His writings contain the chemical formula for it, but it is generally supposed that he obtained it from the Arabs, from whose writings he derived other suggestions. He was acquainted with geography and astronomy, discovered the errors of the calendar and their causes, and made a corrected calendar. In moral philosophy also, Bacon laid down some excellent precepts.

Ba'con, Roger, his Opus Majus (1267 A.D.). Newly edited and published, with introduction and full English analysis of the Latin text, by J. H. Bridges (2 vols. 1897). An adequate publication, after 630 years, of one of the most remarkable productions of the human mind.

The work is an exhortation addressed to Pope Clement, urging him to initiate a reform of Christian education, in order to establish the ascendancy of the Roman Catholic Church over all nations and religions of the world. Its central theme was the consolidation of the Roman Catholic faith as the supreme agency for the civilization of mankind. Its author wished to see recognition of «all the sciences,» since all are parts of one and the same complete wisdom. He first gave experiment the distinct and supreme place which was later revived by Descartes, and carried out in modern science. He formed a clear conception of chemistry, in his day not yet separated from alchemy; and of a science of living things, as resulting with chemistry from physics. In the part of his work dealing with moral philosophy, Bacon makes the first attempt ever made at the comparative study of the religions of the world. His protests against the intellectual prejudices of the time, his forecasts of an age of industry and invention, the prominence given to experiment, alike as the test of received opinion and the guide to new fields of discovery, render compari-

son with Francis Bacon unavoidable. In wealth of words, in brilliancy of imagination, Francis Bacon was immeasurably his superior. But Roger Bacon had the sounder estimate and the firmer grasp of that combination of deductive with inductive method which marks the scientific discoverer.

Ba'con, Thomas Scott, American theological writer: b. Saratoga, N. Y., 1 Feb. 1825. Originally a lawyer, he became an Episcopal clergyman (1854). Besides sermons, addresses, reviews, etc., he has written 'Both Sides of the Controversy Between the Roman and the Reformed Church' (1858); 'The Reign of God, not the Reign of Law' (1879); 'The Beginnings of Religion' (1887); 'Primitive and Catholic Doctrine as to Holy Scripture'; 'It is Written.'

Ba'con, Philippine Islands, a town in the province of Albay, Island of Luzon. Pop. about 13,000.

Ba'con, the name given the sides of a pig which have been cured or preserved by salting with salt and saltpetre, and afterward drying with or without wood smoke. By the old process of rubbing in the saline mixture, the curing occupied from three to four months. The method now adopted on a larger scale is to place the prepared flitches in a fluid pickle. The pickling, drying, and smoking now occupy not more than six weeks. Bacon may be called the poor as well as the rich man's food. By the former it is prized as a necessary of life; by the latter, for its exquisite flavor. The nitrogenous, or flesh-forming matter in bacon is small, one pound yielding less than one ounce of dry, muscular substance, while the amount of carbon compounds, or heat givers, is large, exceeding 60 per cent. Its digestibility, however, owing to the large proportion of fat it contains, is not less than that of beef or mutton.

Ba'con Bee'tle (*Dermestes lardarius*), an insect, the larva of which destroys bacon, lard, and furs.

Baco'nian Philos'ophy, the inductive philosophy of which it is sometimes said that Lord Bacon was the founder. This, however, is an exaggerated statement. What Lord Bacon did for this mode of ratiocination was to elucidate and systematize it; to point out its great value, and to bring it prominently before men's notice; lending it the support of his great name at a time when most of his contemporaries were satisfied with the barren logic of the schools. The triumphs of modern science have arisen from a resolute adherence on the part of its votaries to the Baconian method of inquiry.

Ba'con's Rebel'lion, in Virginia, 1676. The English Navigation Acts of 1651 and 1660, restricting colonial trade to English vessels, had produced universal distress in Virginia, forcing it to buy and sell to the home monopolists at their own price; tobacco, not only the chief product, but the chief currency, became almost worthless. In 1667 the smaller landholders were reported on the brink of rebellion, and in 1673 there were meetings to refuse payment of taxes. Meantime the corrupt civil service of the colony, place-hunters sent over by Charles II. to be rid of them, were plundering the planters by means of the export dues, in collusion with the governor, Sir William Berkeley (q.v.); and the latter was fattening on a fur trade with the Indians. To save himself from the opposition or criticism of the masses, whom he hated and despised, and perpetuate the oligarchy of the small group of rich planters who formed his council, he kept his legislature of 1662,— strongly royalist from the enthusiasm of the Restoration,— in office till 1676 by annual adjournments without new elections; he had also abolished universal suffrage and substituted a property qualification. This built up a strong opposition, including some of the solidest citizens. In 1675 a terrible Indian war broke out, wrapping the frontier in fire and blood; 36 whites were murdered in one day of January 1676. Berkeley, implored to protect the settlements, ordered out a force under Sir Henry Chicheley, then suddenly dissolved it, recalled Chicheley's commission, and refused to do anything more till the Assembly met in March. The result was frightful: within 17 days 60 of the 71 plantations in Rappahannock parish were destroyed, and by the time of the March meeting, over 300 victims had perished, a large part by fiendish tortures. Even then, under Berkeley's orders, the «Long Assembly» (so called in allusion to the Long Parliament) merely committed another outrage: instead of authorizing an army, they authorized frontier forts, to have a garrison of 500 soldiers (from the seaboard counties, not the frontier one which suffered from the Indians, and hated the governor). No attack on the Indians was to be permitted except under specific orders from the governor. Two million pounds of tobacco more were added to their taxes for this mockery of protection, and most of that was embezzled and the forts built so as to be worthless, even for the little service they could do. The people petitioned for leave to form expeditions at their own charge under any leader Berkeley might appoint; he forbade any further petitions of the sort under heavy penalties. It was the universal belief that his one solicitude was to save his Indian trade monopoly from harm. Finally the people of Charles City County petitioned once more for leave, in face of actual ravages then going on; and once more the obstinate and avaricious old man refused it. Men could bear no more; they raised 300 volunteers on their own risk, and by acclamation placed at their head Nathaniel Bacon (q.v.), a planter of 29, recently from England, and one of the governor's council. He accepted it and wrote to Berkeley for a commission; Berkeley returned an evasive answer, and Bacon started on his expedition without it. Berkeley hearing of it, sent an order for the company to disperse; all but a few, however, kept on and dispersed the Indians. Berkeley collected a troop of horsemen, and set out to arrest Bacon, when he heard that the colony was all in revolt behind him; and he hurried back to Jamestown, dissolved his 14-year-old Assembly, and issued writs for a new one. Despite his suffrage restriction, there was a heavy majority against him; Bacon being one of the new members. As the latter approached Jamestown, he was arrested and brought before Berkeley, who, in view of the uprising, did not dare proceed to extremities, but paroled him, and on Bacon's making submission for attacking the Indians without license allowed him to take his seat, with a tacit agreement to give him his commission to finish

the Indian war. The new legislature, besides restoring universal suffrage and making other reforms very distasteful to Berkeley, provided for raising an army of 1,000 men for Indian service. But Bacon, still refused the commission, and privately warned that his life was in danger, fled, shortly returned with 600 men, and forced Berkeley to sign his commission as major-general for the Indian campaign, and also a memorial to the king in his favor and reciting the colonial grievances. This later was sent off with a secret note from Berkeley, disavowing it. Bacon within a month had nearly put down the Indian outbreak, especially by a crushing victory at Bloody Run (near Richmond), when he heard that the governor had proclaimed him and his party rebels, and to escape popular wrath had fled across the peninsula to Accomac. Bacon marched back to Middle Plantation (the site of Williamsburg), launched a manifesto against Berkeley, and drew around him a gathering of some prominent men and a vast number of penniless ones (for the movement was largely a democratic revolt against an overweening aristocracy). They agreed to stand by him even against a royal army; feeling that they were compromised beyond retreat at best, and hoping to hold out till the king could be correctly informed and pardon them. Bacon carried on the Indian campaign till September, thoroughly stamping out the danger to the colony; meantime sending an expedition to capture Berkeley, which was itself captured. Berkeley gathered about 1,000 militia by promising them the confiscated estates of the rebels, and reoccupied Jamestown; Bacon marched against him, drove him to Accomac once more, and burnt Jamestown to the ground. But he had taken malaria there, and while invading Gloucester County to attack Major Brent, was stricken down, and died 1 October. The rebellion at once collapsed, and Berkeley wreaked a frightful vengeance upon Bacon's adherents. See BERKELEY, SIR WILLIAM. For authorities, besides new documents published in 'Virginia Magazine of History' (1893–8), see the 'Century Magazine,' Vol. XL., under "Nathaniel Bacon," by Edward Eggleston; and John Fiske's "Old Virginia and Her Neighbors," 1897, Vol. II.).

Bacoor, bä'kō-ōr', Philippine Islands, a town of the province of Cavite, on the Island of Luzon. Pop. about 14,000.

Bacsanyi, Janos, Hungarian poet: b. Tapolcza, 11 May 1763; d. 12 May 1845. His first work, published in 1785, procured him an appointment in a public office, but a liberal poem cost him this in 1793, as well as his liberty the year after. In 1796 he went to Vienna, and there he married a few years later the German poet, Gabrielle Baumgarten — an unhappy match. In 1809, Bacsanyi translated Napoleon's proclamation to the Hungarians, and was afterward obliged to take refuge in Paris. After the Peace of Paris, he lived at Linz, where he died. His collected poems appeared at Budapest in 1827.

Bacteræ'mia, a form of poisoning due to bacterial products. This poisoning is usually due to the absorption of toxins from bacteria situated either on the surface of the body, the intestinal canal, or in some confined space. See PYÆMIA.

Bacteria. Literally the word bacterium, bacteria being its plural, means a tiny rod or stick. As understood, however, by biologists, bacteria constitute a genus of lowly organized microscopic plants having forms other than that indicated by the literal meaning of the word. Briefly defined, bacteria are unicellular vegetables that multiply by the simple process of transverse division — they are, therefore, schizomycetes. In size they are all of microscopic dimensions requiring in most cases to be magnified from 600 to 1,000 diameters before becoming visible and even then they appear in many instances as scarcely more than tiny points. As encountered in nature they assume a variety of forms which may be conveniently arranged into three principal groups, namely: the spherical, the rod-like, and the spiral. To the spherical forms the name *cocci* or *micrococci* (*coccus,* singular) is given, and, according to the manner in which these tiny spheres develop and their progeny adhere to one another, they are further severally designated as *staphylocci,* that is, cocci clustering irregularly together like grapes in a bunch; *streptococci,* that is, cocci adhering together like beads or pearls in a strand; *diplo-cocci,* that is, cocci occurring in pairs; *tetracocci,* that is, cocci clustered in fours, etc.

To the rod-like group — that is, those which are straight, having one diameter longer than another — the designation *bacilli* (*bacillus,* singular) is given. While the structure and mode of multiplication of many of the bacilli is as simple as is that of the micrococci — that is, one cell divides into two, two into four, and so on *ad infinitum,* without variation, it is nevertheless in the group of bacilli that we encounter a number of species provided by nature with a more highly organized and complicated means for propagation and perpetuation. It is here that we encounter species in the course of whose life cycle there develops within each rod a single tiny, oval, highly resistant body, a spore as it is called, which may be fairly compared to the seeds of higher plants and which, like the seed, may be gathered and kept for almost indefinite periods, without losing their power of germination. Since such spores of bacteria are markedly tenacious of life even under the most unfavorable of circumstances it is obvious that the power to form spores is an important provision for the preservation of the species. It is of passing interest to know that the ability to form spores is possessed by some, but not all, of the disease-producing bacteria, a fact that serves to explain in part the difficulties experienced by the sanitarian in eliminating certain types of infection. For it must be remembered that the infective species capable of entering the spore stage are by virtue of that property much less vulnerable to the action of disinfectants and disinfecting processes than are the species not so endowed.

The spiral forms, *spirilla, spirochaeta,* as they are called, comprise those bacteria having one or more curves in their long axis, that is, those that are twisted like a corkscrew. They are sometimes seen as homogeneous, long spiral threads without segmentations, while again they may consist of short curved segments adhering end to end. Spore formation is not a characteristic of the spiral bacteria.

In structure bacteria are non-nucleated masses of protoplasm surrounded by an en-

veloping zone appearing in some instances to be but a condensation of the central protoplasm, while in others it partakes somewhat of the nature of mucin. Many of the bacteria exhibit no evidence of independent motility, while others, by virtue of special locomotive apparatus (*flagella*) move themselves about in fluids in a most energetic manner. As their structure is exceedingly simple, in so far as formed elements are concerned, their mode of nutrition is, physically speaking, correspondingly simple — that is, the nourishment is absorbed and their waste products discharged directly through their enveloping membranes by the process of osmosis. This being the case it is obvious that bacteria can multiply and perform their physiological functions only under conditions of moisture. Unlike the more highly organized plants bacteria are apparently without special provisions for gaseous exchange, that is, they are devoid of chlorophyl. They obtain their oxygen as such from the free air or from easily decomposable oxygen compounds. In the course of his early investigations in this field Pasteur discovered a group of bacteria that have ever proven to be of the greatest interest — a group that, paradoxical as it may seem, not only does not require free oxygen for its life processes but to the growth of which free oxygen is actually prohibitive. To these species he gave the designation *anaerobic* to distinguish them from the majority, the *aerobic* varieties, to which free oxygen is essential. In their relations to higher life bacteria may be regarded as allies or as enemies, according to the nature of the species under consideration. Contrary to notions that have been more or less prevalent the majority of bacteria have nothing to do with disease production. Their natural role is that of scavengers. They are concerned in nature's great laboratory, the soil, in working over dead organic matters into forms appropriate to the nourishment of growing vegetation. Since in the course of this conversion dead bodies that would otherwise encumber the earth are caused to disappear they must from both the æsthetic and economic standpoints be regarded as, in the main, benefactors. In this group of *saprophytic* bacteria, as they are called, that is, those that live on dead matters, we encounter species of the greatest interest and importance. It is here that we perceive the omnipresent forms concerned in the reduction of dead animal and vegetable tissues into such simple forms as carbon dioxid, ammonia and water to be used by higher plants. It is in this group that we find the ever-present nitrifying species — that is, those peculiar ferments that assist the leguminous plants in assimilating free atmospheric nitrogen; that oxidize the ammonium of decomposition to the nitrous and nitric acids so essential to plant life; that convert the objectionable organic matters of sewage and polluted waters into an inert inorganic form and that, through their specific activities supply, where circumstances are favorable, the entire commercial world with its supply of saltpetre.

The saprophytic group also comprehends many species used in the arts and industries — such, for instance, as those concerned in the production of certain organic acids; those employed in the manufacture of indigo by the fermentation process and in the preparation of hemp; and those utilized in the manufacture of cheese and butter. In the study of this large group one constantly encounters other species presenting most engaging characteristics — some of these, the *chromogenic* varieties, have the property of producing during the course of their growth pigments of great beauty — brilliant reds, delicate pinks, rich purples, yellows ranging from the palest lemon to the deepest orange, are those most often encountered. In another group, the *photogenic*, we meet with species having the emission of light as their most singular peculiarity. When growing these forms glow with a peculiar phosphorescence, and it is significant to note that these luminous varieties have been most frequently encountered in the sea and upon articles from the sea. The evil odors of putrefaction are the results of saprophytic bacterial development. In the *parasitic* group of bacteria we encounter those species that exist always at the expense of a living host, either animal or vegetable, and in doing so not only appropriate materials necessary to life, but give off in return waste products that may act as direct poisons to the host. Fortunately this is a much smaller group than is the saprophytic mentioned above. In no particulars, save for their ability to exist at the expense of a living host and cause disease, are the disease-producing bacteria distinguishable from the innocent varieties. The essential difference between the disease-producing and the innocent bacterial species is that the former possess as their most striking physiological peculiarity the power of elaborating poisons, *toxins*, technically speaking, that have a direct destructive action upon the tissues of their host. In some cases the poisons may be properly regarded as secretions of the bacteria, and, under artificial conditions of cultivation, may easily be separated from the living bacteria elaborating them. This is especially true of the poisons of diphtheria and of tetanus or lock-jaw. When thus separated such poisons, entirely independent of the living bacteria, retain the specific property of causing the symptoms and many of the pathological changes that characterize the growth of the living bacteria in the tissues. In other cases the poisons cannot be so readily separated; they appear to be an integral constituent of the protoplasm of which the bacteria are composed. This is especially the case with the toxins of *bacillus typhosus, bacillus dysenteriæ,* and *spirillum choleræ Asiaticæ* — the organisms concerned in the causation of typhoid fever, epidemic dysentery, and Asiatic cholera, respectively. In the case of still other pathogenic species there is little doubt that specific intoxicants are in one way or another elaborated during infection, but as yet they have not been satisfactorily demonstrated. Nevertheless, it may be said that, in general, infection by bacteria is to-day regarded as essentially a chemical phenomenon — that is, as a reaction between the poisons elaborated by the bacteria and the tissues with which they come in contact; the result of the reaction being the partial or complete death of the host in which the phenomenon is in operation.

Bactericide, any agent capable of killing bacteria. The older terms, antiseptic, germicide, etc., cover too broad a field, and the word bactericidal has come to mean something more definite and exact than the older terms. Heat is one of the best bactericidal agents. Cold is not bactericidal. Even the lowest temperatures do not destroy the life of these plants. The metallic salts and the phenols are the bactericidal agents most in use. The aldehydes, formaldehyde, benzyaldehyde are also efficient. See ANTISEPTIC; GERMICIDES.

Bacteriology. Though generally considered a modern science, and perhaps properly as regards certain of its most important developmental aspects, bacteriology in reality dates from the observations of the Dutch investigator Leeuwenhoek in the latter part of the 17th century. With simple lenses ground by himself, Leeuwenhoek discovered in the mouth, in the excreta, in water, and in other matters examined by him, the presence of countless bodies of smaller dimensions than anything hitherto seen. These "animalcules," as he called them, were often observed to move themselves about in a remarkably energetic manner, and, judging from his text and illustrations, they were doubtless the bodies we now recognize as bacteria. Leeuwenhoek's observations were immediately seized upon by the philosophers of the day as offering an explanation for many hitherto unexplained phenomena. So general became the belief in a causal relation between the "animalcules" and all manner of disease conditions that for a time, we are told, there prevailed almost a "germ mania."

To the investigators of the time the question of greatest fascination in connection with this newly-discovered world was as to its origin. Many believed and stoutly maintained that the "animalcules" were the products of metamorphosis of either living or dead tissues of more highly organized beings; others that they arose *de novo* in "putrescent atmospheres"; many suspected them of spontaneous generation in some other mysterious way; while a few maintained, on experimental evidence, that they were probably the descendants of pre-existing creatures of the same kind. Singular as it may seem it took nearly two centuries to close finally that debate and to prove that the dictum of Harvey "*omne vivum ex ovo*" or better, its appropriate modification "*omne vivum ex vivo*" was as applicable to the microscopic as to the world of higher beings. In its modern aspect bacteriology dates from the epoch-making investigations especially of Koch and of Pasteur conducted during the eighth decade of the 19th century. During that period observations were made and methods of work devised that went far toward starting the subject on its career as a science. In the study of bacteria, as of all other forms of life, it is essential to a correct interpretation of form and physiological function that the observations be made upon isolated species. Prior to the period mentioned this was not possible, for the methods in vogue were insufficient for the separation of these minute creatures from one another. For the development of the science probably the most important step was, therefore, the introduction by Koch of trustworthy methods for the separation of individual bacterial species from mixtures of them, and for the more or less complete determination of their specific morphological and physiological peculiarities; that is, for the isolation and study of bacteria in "pure cultivation," as it is technically called. Up to the time of Koch's classical research upon the methods of investigating bacteria, their study had been conducted in fluid materials; that is, in infusions of either vegetable or animal matters, in which most bacterial species develop with remarkable activity. Since many totally distinct species are indistinguishable from one another by their size, shape, and general appearance, it was obviously impossible, by the older methods of study, either to be certain if one were dealing with one or more species in the fluids in which they were growing, or to separate the one from the other in case of confusion. Koch appreciated this defect and suggested the use of solid materials as culture media, hoping thereby to reproduce the conditions so often seen when such organic matters as bread, potato, cheese, etc., become moldy on exposure to air. Here one sees the mold not always as an inextricable mixture of different species, but often as sharply isolated islands of beginning growth — as mold colonies — so to speak. These, on examination, are usually found to consist of single species, and on a slice of moistened bread one may often observe several colonies of distinct species growing side by side without, for a time at least, encroaching one upon another. By appropriate methods it is easily possible to transplant such colonies, free from admixture with other forms, and study them as "pure cultures." But such substances as bread, potato, etc., are not in general as well adapted to the study of bacteria as to that of molds. Appreciating this Koch demonstrated that the addition of gelatin to the infusions employed for the successful cultivation of bacteria converted them into practically solid culture media without robbing them of any of their useful properties; and that by the appropriate employment of such solid media it was easily possible to separate as pure cultures the individual species composing the mixtures of bacteria that one desired to analyze. Thus, for example, if a tube of gelatinized beef tea, freed from all living bacteria by heat, be gently warmed until liquefied, and be then inoculated with a mixture of several species of bacteria, growth at once begins, and if left in the test-tube progresses in about the same manner as if the beef tea did not contain gelatin; but if while still warm and fluid the contents of the tube be poured out upon a flat, cold surface, the increased area causes the bacteria to become more widely separated from one another and the lower temperature results in the solidification of the gelatin, so that each bacterium is fixed in its new position. It at once begins to germinate, and presently a "colony" results; the surface ultimately becoming studded with such colonies. As the colonies from the different species differ from one another in many ways — in outline, texture, color, effect of their growth on the gelatin, etc. — it is easily possible, after a little practice to distinguish them by the naked eye, and by transplanting them to tubes of sterile culture media to study them without the disturbing presence of other species; that is, in pure culture.

The introduction of this method for the isolation and study of bacterial species in pure cultivation certainly constitutes the most impor-

tant stimulus to the development of modern bacteriology. By it results were placed upon a more secure basis than ever before, and a confidence in the work such as had never existed was awakened in the minds of all students of the subject.

The studies that had been made by Pasteur upon fermentation; upon the souring of wines; upon the maladies of silk worms, and upon certain fatal epizootics of fowls and domestic cattle; together with Koch's fundamental studies upon the infections of wounds and the appropriate methods of analyzing them were rich in suggestion to the pioneers in this new field. Within a comparatively brief period after the adoption of the new methods our knowledge of the exciting causes of many hitherto obscure diseases was greatly extended; it was shown to be possible to determine the modes of their transmission and the channels through which infection occurred. The conditions most favorable to the successful action of a host of substances employed for the purpose of disinfection were accurately determined. And early in the work observations were made that indicated the possibility of successful vaccination against disease through the use of attenuated (weakened) living cultures of specific disease-producing bacteria. One of the most important outgrowths of modern bacteriology has resulted from its application to the problems of the sanitary engineer. As a result of these studies we know that sewage, polluted waters, and polluted soils tend naturally to revert to a state of purity if their pollution be checked and that this progressive purification is due in large part to the activities of the bacteria located within them. It has been found that by the appropriate adjustment of conditions the normal activity of the bacteria may be so greatly accentuated as to constitute them the most important factors in the purification of polluted waters and sewage. The utilization of these facts is conspicuously illustrated in the purification of water by the process of natural sand filtration and in the purification of sewage by irrigation; by the septic tank process, etc. In these methods the living bacteria, and they alone, are the instruments through which the results are attained. The sand grains in the filters and the particles of soil in the irrigation fields serve only as objects to which the bacteria can attach themselves and multiply. By the normal life processes of the bacteria the polluting organic matters in the fluids to be purified are used up and inert matters given off as a result.

In the study of agricultural phenomena from the bacteriological standpoint knowledge has been equally extended. At one time it was taught that atmospheric nitrogen — representing roughly 80 per cent of the air by volume — was of no direct biological significance. This view has in late years been entirely revised. We have learned that the leguminous plants when assisted, symbiotically, by certain soil bacteria, are enabled to make up their nitrogen deficit in large part from the free nitrogen of the air; a fact that sheds important light upon the significance of plants of this type in the practice of "rotation of crops." Under normal conditions instead of impoverishing the soil, the legumens — clover, peas, beans, etc., — with the aid of the bacteria attached to their roots, may actually enrich it. The application of bacteriological methods to the study of dairy processes has revealed the interesting fact that the delicate flavors to which butters and cheeses owe their commercial value are directly due to the products of growth of certain species or groups of species of bacteria and more highly organized molds. A number of such species have been isolated and are kept in pure cultivation — so that by purposely inoculating the fresh cream with them butter of uniform flavor may with comparative ease be produced.

Probably the most important results of applied bacteriology are those in connection with preventive medicine. Early in the course of the work it was discovered by Pasteur that certain virulent pathogenic bacteria when kept under particular conditions gradually lost their disease-producing power, wholly or in part, without their other life properties being conspicuously disturbed. If injected into animals when in this attenuated state the result was a mild, temporary, and modified form of infection usually followed by recovery. With recovery the animals so treated were immune from the activities of the fully virulent bacteria of the same species; in other words, they had been protected from the fatal injection by vaccination with an attenuated species. The subsequent developments growing out of this observation have resulted in the annual saving of millions of money through the successful vaccination of sheep, horses, and bovines against the fatal infection known as splenic fever or anthrax, and, though less successfully, of other domestic animals against other infections also. In the closer analysis of the means by which infective bacteria cause disease it soon became evident that it is through the elaboration of specific poisons; sometimes easily separated from the bacteria, at others so intimately associated with the bacterial tissues as to make their separation difficult or impossible. The question arose as to the effect of the poisons, separated from the living bacteria, upon the animals susceptible to infection by the bacteria themselves, and it was found that fatal intoxications often accompanied by the same constitutional symptoms and pathological lesions followed the use of the poisons, just as would follow inoculations with the bacteria by which they were produced. In pursuance of this topic it was discovered that if very small, only mildly intoxicating doses of these specific poisons of bacterial origin were repeatedly injected into susceptible animals that after a while the latter acquired not only a sort of tolerance to them, but a tolerance that was accompanied by the presence in the circulating blood of an antidote for these poisons — an "antitoxin," as it is called. This reaction has been shown to be possible for a number of specific infections, and in the case of diphtheria has met with such practical success as to be deservedly regarded as the triumph of modern medicine.

Bacteriolytic, an agent capable of destroying bacteria and usually applied to some product of the human body, or of an animal body, notably blood serum, which when injected into an animal is capable of destroying some form of micro-organism in that animal. The production of specific bacteriolytic sera is one of the great advances in modern medicine and its extension promises much hope for the future treatment of many of the bacterial diseases. Bacteriolytic sera have been made for a number of micro-organisms. See Immunity.

Bacterium, a genus of bacteria of the family *Bacillariaceæ,* characterized by rod-shaped forms and absence of flagella. They are thus non-motile. A large number of pathogenic bacteria belong to this genus. See Bacteria; Bacillus.

Bac'tria. See Bactriana.

Bactriana, băk-trī-ā'na, or **Bactria,** a country of the ancient Persian empire, lying north of the Hindu Kush Mountains, on the Upper Oxus. It corresponded pretty nearly with the modern Balkh. Here many scholars locate the original home of the Aryan or Indo-European family of nations. Its capital, Bactra, or Zariaspa, was also the cradle of the Zoroastrian religion. Originally a powerful kingdom, it maintained its independence until its subjugation by Cyrus about 540 B.C., when it became a satrapy of the Persian empire. It was included in the conquests of Alexander, and formed a part of the kingdom of the Seleucidæ until the foundation, about 256 B.C., by Diodotus, of the Greek kingdom of Bactria, which extended to the Indus, and which, after a long struggle, was overthrown by the Parthians. Numerous coins with Greek legends have been found in the *topes* or burial places to the northeast of Kabul.

Bac'trian Cam'el. See Camel.

Bac'tris, a genus of American palms, numbering more than 50 species. The genus is of commercial importance, a tough thread used for net weaving, being made from the fibres of *Bactris acanthocarpa,* and walking-sticks are manufactured from the long slender stems of *Bactris maraja.* The fruit of the latter is considered a delicacy.

Bactrites, băk-trī'tēz, a genus of fossil ammonites, with a straight shell, and indented, but not ramified septa. The genus ranges from the lower Silurian to the Devonian.

Bac'trus, the ancient name of a river in the province of Balkh, central Asia, upon which Bactria was situated.

Baculites, băk'ū-lī'tēz, a genus of fossil ammonites, characteristic of chalk formations, having a straight, tapering shell.

Bacup, băk'ŭp, England, a town of Lancashire, 18 miles north from Manchester. There are a number of churches, chapels, and schools, a mechanics' institute, court-house, market-hall, large co-operative stores, etc. The chief manufacturing establishments are connected with cotton spinning, and power-loom weaving; there are also iron and brass foundries and machine-shops, dye-works, etc., and in the neighborhood coal-pits and vast stone quarries. Its charter of incorporation was granted in 1882. Pop. (1901) 22,505.

Baczko, băts'kō, **Ludwig von,** German historian and scholar: b. Lick, Prussia, 8 June 1756; d. 27 March 1823; was educated at Königsberg, studying philosophy, medicine, and law, but became blind in 1777, through an attack of small-pox. In 1816, he was appointed director of the Institute for the Blind at Konigsberg. He is the author of 'A History of Prussia,' a 'History of the French Revolution,' and 'Concerning Myself and My Companions in Misfortune, the Blind' (1807).

Bad Lands, a name applied to the arid regions of the west, where are districts presenting wide areas of hills and ridges of moderate height, bare of sod and intricately broken by numerous gullies and ravines. The principal areas are in the western Dakotas and central Wyoming, and smaller examples of bad-land topography are of frequent occurrence in the arid regions in various portions of the world. In the Big Bad Lands of western South Dakota, east of the Black Hills, there is an area of about 2,000 square miles, which consists largely of bad lands occupying extensive basins cut in a plateau along the White and Cheyenne rivers. They present wonderfully weird scenery, but are rarely visited by the average sight-seer. An extensive area in the valley of the Little Missouri River is crossed by the Northern P. R.R. in the vicinity of Medora, and many bad-land features are visible near the railroad. Typical bad lands present ridges and mesas from 200 to 400 feet high in greater part, eroded into fantastic shapes and cut by ravines and gullies into an endless variety of rugged buttresses and pinnacles. The materials are mainly light-colored, sandy clays, and soft sandstones in nearly horizontal strata, and their bare slopes are dazzling in the bright sunlight. Most bad land regions were table-lands originally, and areas of the old surface remain in level-topped, grass-covered mesas of various sizes, with bad land slopes extending to flat-bottomed valleys of greater or less width. Bad lands exhibit clearly the close relations of topographic form to rock texture, the homogeneous clays being carved into regular slopes, in which sandstone layers give rise to benches, or protect columns and pinnacles of clay. Bad lands are developed in soft rocks where a region has been so uplifted that there is rapid erosion, under arid or semi-arid climatic conditions. The occasional rains cut gullies which eventually are deepened into ravines, and, as the rocks are soft, the erosion progresses more rapidly than vegetation can establish itself. In regions of abundant rainfall, vegetation is so vigorous that it usually forms a protective mantle on all but the steeper slopes, but in arid lands, a thin sod is the principal growth, and it is quickly removed by the rapid run-off of the torrential rains. The Big Bad

Typical views in Big Badlands of South Dakota, showing pinnacles of hard clay capped by sandstone, the sodless slopes, and in the distance a remnant of the original plateau out of which the Badlands are eroded.

Lands of South Dakota have yielded large numbers of fossil animals of late Eocene age, which have made the region famous as a collecting ground.

N. H. Darton,
U. S. Geological Survey.

Badagri, bä'da-grē, or **Badagry,** a British seaport on the Bight of Benin, in the extreme southwest corner of the British Niger Territory, Africa. Early in its history it was a noted slave mart; contained important manufactories; and had a population of 10,000. It was from this place that, in 1825, Clapperton and Lander started to explore the African interior.

Badajoz, bä'dä-hōth', the capital of the Spanish province of Badajoz, on the left bank of the Guadiana, which is crossed by a stone bridge of 28 arches. It is a bishop's see, and has an interesting cathedral. During the Peninsular war, Badajoz was besieged by Marshal Soult, and taken in March 1811. It was twice attempted by the English, on 5 and 29 May 1811; was besieged by Wellington on 16 March, and taken 6 April 1812. Pop. 22,860.

Badakhshan, bä'dakh-shän', a territory of central Asia, tributary to the ameer of Afghanistan. It has the Oxus on the north and the Hindu Kush on the south; and has lofty mountains and fertile valleys; the chief town is Faizabad. The inhabitants profess Mohammedanism. Pop. 100,000.

Badalona, bä'da-lō'na, a seaport of Spain, on the Mediterranean, five miles from Barcelona. Pop. 19,200.

Baddeck', a fishing village and summer resort on Cape Breton Island.

Bad'derlocks (*alaria esculenta*), an olive-colored sea weed which grows on rocks in deep water on the shores of Europe and Iceland. It has a short cylindrical stem with lateral spore-bearing process, and a membranous olive-green frond of 2 to 12 feet long, with a stout midrib. This midrib, together with the fruits, is eaten by the inhabitants of the sea coasts of Iceland, Denmark, Scotland, Ireland, etc., and is said to be the best of the esculent algæ. The name is supposed to be a corruption of balder-locks.

Badeau, ba-dō', **Adam,** American military officer: b. New York, 29 Dec. 1831; d. 19 March 1895; was educated at private schools. He served with gallantry in the Union army during the Civil War; was on the staff of Gen. Sherman in 1862–3, and secretary to Gen. Grant in 1864–9; and in the latter year was retired with the rank of captain in the regular army and of brevet brigadier-general of volunteers, and was appointed secretary of legation in London. He was consul-general in London, 1870–81, and during this period was given leave of absence to accompany Gen. Grant on his tour around the world (1877–8). In 1882–4 he was consul-general in Havana. After the death of Gen. Grant he brought suit against his heirs for payment of services rendered in the preparation of Gen. Grant's 'Memoirs,' which was satisfactorily settled out of court. His publications include: 'The Vagabond' (New York 1889); 'Military History of Ulysses S. Grant' (3 vols. 1867–81); 'Conspiracy; A Cuban Romance' (1885); 'Aristocracy in England' (1886); and 'Grant in Peace' (1886).

Baden, bä'dĕn, a grand duchy in the German empire. The Rhine separates it from Alsace on the east, and Würtemberg bounds it on the west. It has an area of 5,823 square miles, with a population of 1,866,584 in 1900, an increase of 121,120 over the census of 1895, or a gain of 1.58 + per cent each year. The country is mountainous, being traversed by the lofty plateau of the Schwarzwald, or Black Forest, which attains its highest point in the Feldberg (4,904 feet). The nucleus of this plateau consists of gneiss and granite. In the north it sinks down toward the Odenwald, which is, however, of different geological structure, being composed for the most part of red sandstone. The whole of Baden, except a small portion in the southeast, in which the Danube takes its rise, belongs to the basin of the Rhine, which bounds it on the south and west. Numerous tributaries of the Rhine intersect it, the chief being the Neckar. Lakes are numerous, and include a considerable part of the lake of Constance. The climate varies much. The hilly parts, especially in the east, are cold and have a long winter, while the valley of the Rhine enjoys the finest climate of Germany. The principal minerals worked are coal, salt, iron, zinc, and nickel. The number of mineral springs is remarkably great, and of these not a few are of great celebrity. The vegetation is peculiarly rich, and there are magnificent forests. The cereals comprise wheat, oats, barley, and rye. Potatoes, hemp, tobacco, wine, and sugar beet are largely produced. Several of the wines, both white and red, rank in the first class. Baden has long been famous for its fruits, also. Of the total area, 42 per cent is under cultivation, 37 per cent under forest, and 17 per cent under meadows and pastures. The farms are mostly quite small. The manufactures are important. Among them are textiles, tobacco, and cigars, chemicals, machinery, pottery ware, jewelry (especially at Pforzheim), wooden clocks, confined chiefly to the districts of the Black Forest, musical boxes, and other musical toys. The capital is Carlsruhe, about five miles from the Rhine; the other chief towns are Mannheim, Freiburg-im-Breisgau, with a Roman Catholic university; Baden, and Heidelberg. Baden has warm mineral springs, which were known and used in the time of the Romans. Heidelberg has a university (Protestant), founded in 1386, the oldest in the present German empire. The railways have a length of 850 miles, and are nearly all state property.

In the time of the Roman empire, southern Baden belonged to the Roman province of Rhætia. Under the old German empire it was a margravate, which in 1533 was divided into Baden-Baden and Baden-Durlach, but reunited in 1771. The title of grand duke was conferred by Napoleon in 1806, and in the same year Baden was extended to its present limits. The executive power is vested in the grand duke, the legislative in a house of legislature, consisting of an upper and a lower chamber. The former consists partly of hereditary members; the later consists of elected representatives of the people. The revenue is mainly derived from taxes on land and incomes, and the produce of crown-lands, forests, and mines. The revenue in 1901 was $37,723,000. Baden sends three members to the German Bundesrath, or Federal Council, and 14 deputies to the Reichstag. Two thirds of the population are Roman Catholics, the rest Protestants.

Ba'den, a town in Switzerland, canton Aargau. The town (*Ober-Baden,* or *Baden-im-Aargau*) is 12 miles northeast of Aarau, on the left bank of the Limmat. It has a town-hall, a handsome Roman Catholic church, a convent, monastery, hospital, etc., and is celebrated for its hot sulphurous baths, which are employed in gout, rheumatism, and cutaneous diseases. The hottest springs have a temperature of 116° F. The Romans were well acquainted with the baths here; and between the 15th and 18th centuries they were the most celebrated in Europe. Pop. (1900) 6,100.

Ba'den-Ba'den (anciently, *Civitas Aurelia Aquensis*), a town and watering-place in the grand-duchy of Baden, 18 miles south-southwest of Carlsruhe. The older part of the town is built on a spur of the Black Forest, overhanging the valley of the little stream Oosbach. The houses here are in general old and high; the streets mostly narrow and crooked, and nearly all steep. The new and larger portion of the town lies below, and is rich in fine hotels, elegant villas, and handsome private dwellings. The edifices most deserving of notice are the New Palace, standing on an isolated height above the town, and surrounded by fine gardens; the town or parish church, containing the tombs of 14 margraves of Baden; the Protestant church, the English church, and the new town-hall. Baden has been celebrated from remote antiquity for its thermal baths, which made it a favorite resort of the Romans. The season lasts from 1 May to 31 October, and 60,000 visitors arrive annually. Pop. (1900) 15,700.

Baden-Powell, bā'dĕn-pow"l, **Sir George Smyth,** English politician and political writer: b. Oxford, 24 Dec. 1847; d. 20 Nov. 1898. He became a member of various important commissions, among others that on United States and Canadian fisheries (1886–87); the new Malta Constitution (1887); the Bering Sea inquiry (1891); the Joint High Commission (Washington, 1892); and the Paris Arbitration (1893). He was author of 'New Homes for the Old Country' (1872), a storehouse of information about Australia; 'Protection and Bad Times' (1879); 'State Aid and State Interference' (1882); 'The Truth About Home Rule' (1888); 'The Land Systems of India' (1892); etc. He was a member of Parliament from Liverpool from 1885 till his death.

Ba'den-Pow'ell, Robert Stevenson Smyth, British military officer; b. London, 22 Feb. 1857; was educated at the Charterhouse School; joined the 13th Hussars in 1876; was adjutant in India, Afghanistan, and South Africa; Assistant Military Secretary on the staff in South Africa in 1887-9; took part in the operations in Zululand, for which he was highly commended, in 1888; assistant military secretary in Malta in 1890-3; on special service in Ashanti, commanding the native levies, 1895, for which he was brevetted lieutenant-colonel; chief staff officer in the Matabeleland campaign, for which he was brevetted colonel, and became lieutenant-colonel, commanding the 5th Dragoon Guards, in 1897. In the war in South Africa in 1899-1900, he signally distinguished himself by his grand defense of Mafeking, Cape Colony, holding the town with a small force against repeated attacks, under an almost continuous bombardment, from 15 Oct. 1899, to 16 May 1900. Three relief columns were started, the last only being successful. In recognition of this heroic defense, the queen promoted Baden-Powell to be a major-general. Gen. Baden-Powell has published several works, including 'Reconnaissance and Scouting' (1890); 'Vedette' (1890); 'Cavalry Instruction' (1895); 'The Downfall of Prempeh' (1896); 'The Matebele Campaign' (1896), etc.

Baden-bei-Wien, bä'dĕn-bī-vēn, a watering place of lower Austria, about 15 miles south-southwest of Vienna. It was the Aquæ Pannoniæ, or Cethiæ of the Romans, and is still famous for its warm mineral springs, which are frequented during the season by from 12,000 to 15,000 persons, chiefly from the Austrian capital. Season from July to September. Pop. (1900) 17,700.

Badeni, bä'dĕn-ē, **Count Cassimir Felix,** Austrian statesman: b. Poland, 14 Oct. 1846. His father, though poor, was a man of intellect, and was made a count by the king of Poland just before the birth of Cassimir. He also fell heir to a fortune, and his two sons received a university education. Cassimir entered the Austrian civil service; became district chief at Zolkiew in 1871; minister of the interior in 1873; governor of Galicia in 1888; and prime minister of Austria-Hungary, 15 Sept. 1895. In April 1897, because of inability to maintain a Liberal majority in the newly elected **Reichsrath,** he resigned with his cabinet, but the emperor declined to accept his resignation, and he remained in office until 28 November, when he again resigned and a new cabinet was organized. The principal feature of his administration and the one which not only caused his fall, but a long period of political agitation, was his introduction of what is known as the "language ordinance," which allowed the official use of the Czech language in Bohemia and Moravia. This measure alienated the Germans and provoked a racial conflict of a most bitter character between them and the Czechs.

Badenweiler, bä'dĕn-vī-lĕr, a watering place in the grand duchy of Baden, near Müllheim. Its mineral springs are now rated among the indifferent waters, and it is of interest chiefly for the ruins of Roman baths that were discovered in 1847. The foundation of the town is referred to the time of Hadrian, and the remains of the vapor baths, of which there are excellent specimens, are supposed to be of the same period. The ruins show a division for men and for women, each having a large outer court opening into a dressing-room; there is the hot-air bath, the warm bath, and the cold bath. The walls and steps are in their original position. The whole structure is 318 feet by 90 feet.

Badge, a distinctive device, emblem, mark, honorary decoration, or special cognizance, used originally to identify a knight or distinguish his followers, now worn as a sign of office or licensed employment, as a token of membership in some society, or generally as a mark showing the relation of the wearer to any person, occupation, or order.

Badg'er, George Edmund, American statesman: b. Newbern, N. C., 13 April 1795; d. 13 April 1866; was graduated at Yale College in 1813; became a lawyer at Raleigh; and was judge of the North Carolina Superior court

in 1820–5. He was appointed secretary of the navy, 14 March 1841, resigning after the death of President Harrison, and was elected to the United States Senate in 1846 and 1848. In 1853 he was nominated for justice of the United States supreme court, but was not confirmed. He served in the State convention called to pass on the question of secession, although opposed to such measure, and after making a strong speech in defense of the Union, was afterward known as a member of the Conservative party.

Badg'er, Joseph, American clergyman, one of the earliest missionaries to the country northwest of the Ohio River: b. Wilbraham, Mass., 28 Feb. 1757; d. 5 May 1846. He received his early instruction chiefly from his parents, and at the age of 18 joined the Revolutionary army. He remained in service for four years, then determined to obtain an education and engage in the Christian ministry. Entered Yale College in 1781, where he maintained himself and his scholarship by alternately studying and teaching. He remained a few years in Connecticut, then in 1800 was selected by the missionary society of that State to visit the unsettled parts of Ohio. His work took him from settlement to settlement, often more than a day's journey apart, through a country where there were no roads, and across rivers without bridges. During the War of 1812 he was appointed by Gen. Harrison chaplain to the army in that district, and his knowledge of the country was of great service to that commander-in-chief; but he resumed his missionary functions at the close of the war and continued them till 1835, when he retired and lived with his only daughter. During the latter years of his life he received a pension from the United States.

Badg'er, Oscar L., American naval officer: b. Windham, Conn., 12 Aug. 1823; d. 20 June 1899; entered the United States navy, 9 Sept. 1841; became lieutenant-commander, 16 July 1862; commander, 25 July 1866; captain, 25 Nov. 1872; commodore, 15 Nov. 1881; and was retired 12 Aug. 1885. He served on the steamer Mississippi during the Mexican war, taking part in the attack on Alvarado, 1846; led the party that attacked and destroyed the village of Vutia, Fiji Islands, while on the sloop John Adams, 1855–6; and in the Civil War commanded the Anacostia, of the Potomac flotilla, 1861–2, and the ironclads Patapsco and Montauk, in the operations in Charleston harbor in 1863; and was acting fleet captain on the flagship Weehawken in the attack on Fort Sumter, 1 Sept. 1863.

Bad'ger, a stout, burrowing, carnivorous mammal of the fur-bearing family *Mustelidæ,* related to the skunks and weasels, species of which inhabit various parts of the northern hemisphere. Badgers have short legs, elongated feet with powerful toes adapted to digging, heavy jaws with big teeth, and great strength, courage, and cunning. They wear coats of thick fur usually grizzled in brown and gray, the face is striped and the paws are blackish. The fur is of considerable value. The American badger (*Taxidea americana*) was formerly distributed all over the western part of the United States from the prairie districts of Ohio and Wisconsin to the Pacific coast, but has been exterminated by civilization east of the dry plains, where it is still numerous although not often seen, because it rarely comes abroad except in the night. It dwells in deep burrows which it digs for itself and feeds upon gophers, ground-squirrels, such ground-building birds and their eggs and young as it is able to catch, and, in times of scarcity, upon small reptiles and insects. Badgers abound in the vicinity of prairie-dog towns, whose underground homes they can enter or dig out without difficulty. This species is found as far north as Hudson Bay and south to central Mexico, where the local variety is called "tejon." When by rare chance a badger is surprised during the day too far away from his hole to escape into it before being observed, he squats down, withdrawing nose and feet beneath his body, and remains absolutely still, when his grizzled back looks so much like a mere hillock of earth that he is likely to escape being seen altogether. The extraordinary breadth and fatness of his form is one of his strongest characteristics. During the coldest part of the winter he retires to his den and passes the time when no food is to be had in deep sleep. The best account of this animal is to be found in Dr. Coues's 'Furbearing Animals' (Washington 1877). Consult also Ernest Ingersoll's 'Wild Neighbors' (New York 1897). The European badger (*Meles taxus*) is very similar in general appearance but differs in anatomical details. Its general habits and food are like those of the American badger except that in the absence of open plains it dwells in wooded regions and has a fondness for honey, digging it out of the nests of bumblebees and others which make their homes in the ground. This is the animal formerly used in the cruel sport of badger-baiting. A captive badger was placed in an overturned barrel or some similar place, and dogs were set upon it for the amusement of seeing the fighting that resulted. It required a powerful and active dog to overcome the little animal. Frequently, however, the badger was given no fair chance, but was compelled to face in the open two or three dogs. From this unmanly sport is derived the verb "to badger." Many references are to be found in early English literature to this amusement, and to the animal itself under the old terms "grey" and "brock," the latter still in common use in northern England and Scotland. Various closely related species and varieties of the badger are to be found in northern Asia, and other relatives exist in India, Malay Islands, and Africa. For these see SAND-BADGER; HONEY BADGER; RATEL; TELEDU; ZORILLA.

Bad'ger State, a nickname given to the State of Wisconsin.

Badghis, bäd-gēz', a region north of Herat, comprising the country between the Murghab and the Harirud rivers, as far north as the edge of the desert. It lies just to the south of the boundary line between Afghanistan and the Russian territories, as defined in 1887.

Badg'ley, Sidney Rose, Canadian architect: b. near Kingston, Ont., 28 May 1850. He studied architecture in Toronto, and, after practising some time in St. Catharines, established himself in Cleveland, O. He has made a specialty of the architecture of churches and public buildings, and has planned and erected churches

in almost all parts of Canada and the United States, and, among other structures, the Massey Music Hall, Toronto; the Slocum Library and Perkins Observatory, in Ohio; Wesleyan University, in Delaware, and the Medical College, Cleveland. He published an 'Architectural Souvenir' (1896).

Badham, băd'ăm, **Charles,** English educator: b. Ludlow, 18 July 1813; d. 26 Feb. 1884; was considered one of the most eminent classical scholars of his day; and after serving for several years as head master of King Edward VI.'s Grammar School at Louth, he became professor of classics and logic in the University of Sydney, Australia, 1867. While in Sydney he established a system of teaching by correspondence, similar to the present university extension scheme. He published a number of works on Greek classics, and 'Criticism Applied to Shakespeare' (1846).

Badia y Leblich, bą-dē'ą ę lā-blēch', **Domingo,** Spanish traveler: b. 1766; d. 1818; he visited in 1803 and the four following years the Mohammedan countries bordering on the Mediterranean. During the whole of his tour he professed to be a Mussulman, and traveled under the denomination of «Ali Bey el Abbassi.» He was so skilful in carrying out his part that he deceived Moslem rulers and scholars, and was at one time in great favor in the court of Morocco. It is now admitted that he was employed as a political agent by the Prince of Peace, at the instigation of Napoleon. His peculiar situation and religious profession gave him opportunities for making many observations which could not occur to other travelers, and he published an account of his travels, with the title 'Voyages d' Ali Bei en Afrique et en Asie.'

Badinguet, bą'dăñ-gā', afterward Radot, a Moor, as whom Napoleon III. masqueraded to escape from the fortress of Ham in 1846; afterward a nickname for Napoleon III. He died in 1883.

Badius, bā'de-ŭs, French printer and writer: b. 1462; d. 1535. About 1500 he founded his printing establishment at Paris, and published a number of the classics. He annotated these himself and wrote also a life of 'Thomas à Kempis.'

Bad'lam, Stephen, American military officer: b. Milton, Mass., 25 March 1748; d. 24 Aug. 1815; entered the Revolutionary army in 1775; became commander of the artillery in the Department of Canada. On the announcement of the adoption of the Declaration of Independence, he took possession of the heights opposite Ticonderoga and named the place Mt. Independence. Subsequently he rendered good service at Fort Stanwix, and in 1799 was made brigadier-general.

Bad'man, The Life and Death of Mr., an allegory by John Bunyan, published in 1680. It gives a vivid picture of the life of the common people during the time of Charles II.

Bad'minton. The game now called Badminton is in reality a modification of the very ancient game of battledore and shuttlecock; but it is played on a court 44 feet long by 20 wide over a net strung across the centre not less than 18 inches deep, with its lower edge five feet from the ground. The bat is strong, like a racquet bat, and weighs about five ounces. The shuttlecock is feathered after the old fashion. The service line is drawn six and one half feet from the net on either side. A line drawn down the centre, joining the service and base lines, forms two courts at each end. The game can be played by two or four, six or eight players. Each striker scores, or is penalized, according to the result of the rules. See 'The Encyclopædia of Sport' (N. Y. 1898).

Bad'minton, a special, sweetened claret, named for the Duke of Beaufort (of Badminton). As he was a patron of pugilists, the term came to mean, in the prize ring, blood, for which claret was previously a slang term.

Badoc, bą-dōk', Philippine Islands, a town of the province of Ilicos Notre, on the Island of Luzon. Pop. 11,000.

Badoura, bą-doo'rą, the daughter of the king of China, who falls in love with the sleeping prince in the story of Prince Camaralzaman, in the 'Arabian Nights' Entertainment.'

Badrinath, bă'drĭ-năth', a peak of the main Himalayan range, in Garhwal district, Northwestern Provinces, India; 23,210 feet above the sea. On one of its shoulders, at an elevation of 10,400 feet, stands a celebrated temple of Vishnu, which some years attracts as many as 50,000 pilgrims.

Badrulbudar, bą-drool'boo-door', the wife of Aladdin, in the 'Arabian Nights' Entertainment,' story of Aladdin and the lamp.

Bæbia Gens, bē'bĭ-a jĕnz, a plebeian clan of ancient Rome. The first member of the family to obtain the consulship was Cn. Bæbius Tamphilus (182 B.C.). The other distinguished ones are known under their family names, Dives, Herennius, Sulca, etc.

Baedeker, bād'ĕ-kĕr, **Karl,** German publisher: b. 1801; d. 1859; originator of a celebrated series of guide-books for travelers.

Baele, bä-ā'lĕ, an African tribe dwelling northeast of Lake Tchad. It is nomadic, half heathen and half Mohammedan, and owns large herds of cattle, camels, goats, and sheep.

Baena, bä-yā'nä, **Antonio,** Portuguese-Brazilian historian and geographer: b. Portugal about 1795; d. 28 March 1850; was an officer in the Portuguese, afterward in the Brazilian, army. He studied the geography and history of the Amazon valley. His principal works were 'The Ages of Pará (1838), a historic compend stopping in 1823, and 'Chorographic Essay on the Province of Pará' (1839), a geographical and statistical work, giving the details of explorations made by himself. These are still standard authorities on that region.

Bae'na, Spain, a town in province of Andalusia, 24 miles south-southeast from Cordova, on the Marbella. It has two principal and two smaller squares, four parish churches, a town- and court-house, several well-attended schools, two hospitals, a prison, numerous convents, and manufactures of linen, woolen and cotton fabrics. Large quantities of grain and oil are exported to Malaga. Pop. (1897) 11,994.

Baer, bār, **Karl Ernst von,** Russian naturalist: b. Piep, Esthonia, 28 Feb. 1792; d. 28 Nov. 1876; was professor of zoology at Königsberg (1819), and librarian of the Academy of Sciences at St. Petersburg (1834). His principal works were 'History of the Development of

Animals' (2 vols. 1828–37), and 'Researches Into the Development of Fishes' (1835). The writings of Baer are distinguished for their philosophical teachings.

Baer, William Jacob, artist: b. Cincinnati, 29 Jan. 1860. He studied at the Munich Royal Academy, 1880–4, receiving four medals there, and one of his works being purchased by the Academy. Between 1885 and 1892 he painted portraits and pictures, the latter chiefly in the genre style. He then devoted himself almost exclusively to miniature painting, of which he became a pioneer of the modern school. 'Aurora,' 'The Golden Hour,' 'In Arcadia,' and 'The Madonna with the Auburn Hair' are among his best-known miniatures.

Baert, bȧ-ār', **Alexandre Balthazar François de Paule, Baron de,** French writer: b. Dunkirk about 1750; d. 23 March 1825; became a deputy in the General Assembly of 1789. When the Revolution became the Reign of Terror, he fled to the United States, remaining there some years. He returned to France in 1815, and once more became deputy, maintaining his old position as a moderate reformer. He published two historical works, one on Great Britain and her colonies, the other on the country between the Black and Caspian seas.

Baert', or **Bart, Jean,** French sailor: b. Dunkirk, 1650; d. 1702. He raised himself, under Louis XIV., to the rank of commodore, and made the French navy what it was, at that time. The Dutch, English, and Spanish called him the «French Devil.» Bart brought into port a number of Dutch and English vessels, burned others, landed at Newcastle, and laid waste the neighboring country. In 1694, when there was a scarcity of corn in France, he succeeded several times, notwithstanding the watchfulness of the English, in bringing into the harbor of Dunkirk ships loaded with this article. Once he delivered a number of such vessels, in the boldest manner, from the Dutch, into whose hands they had fallen, and received, in consequence, letters of nobility. In 1695 he was taken prisoner by the English and brought to Plymouth, but managed to make his escape. In 1696 he met the Dutch fleet from the Baltic and captured the escort with 40 ships; but on his return to Dunkirk 13 Dutch ships of the line appeared, and to avoid a very unequal combat he was obliged to burn the greater part of his captures. From the Peace of Ryswick to the breaking out of the war of the Spanish succession he lived at Dunkirk.

Bætica, bē'tĭ-kȧ, the central division of ancient Spain under Roman rule, famed for its fertility, its mines of iron, gold, and silver, and its delightful climate. These advantages gave rise to a number of fabulous stories, which made it the home of Geryon, an assailant of Hercules, and placed there the Elysian Fields. It passed into the hands of the Vandals, and it was the first province conquered by the Moors.

Baeyer, bā'yĕr, **Adolf von,** German chemist: b. Berlin, 31 Oct. 1835; son of Johann Jakob Baeyer; became professor of chemistry at Strasburg in 1872, and at Munich, in 1875, succeeding Liebig at the latter. He made many important discoveries in organic chemistry, especially cerulein, eosin, and indol.

Bae'yer, Johann Jakob, Prussian geometrician: b. Müggelsheim, 5 Nov. 1794; d. 10 Sept. 1885; was an army volunteer in the campaigns of 1813 and 1814; joined the army in 1815; and became a lieutenant-general in 1858. He had charge of a number of geodetic surveys; was elected president of the Geodetic Institute in Berlin in 1870; and was the author of numerous treatises on the refraction of light in the atmosphere, the size and form of the earth, etc.

Baez, bä'āth, **Buenaventura,** Dominican statesman: b. Azua, Haiti, about 1810; d. 21 March 1884; aided in the establishment of the Dominican Republic; was its president in 1849–53; was then expelled by Santa Ana and went to New York; was recalled in 1856 on the expulsion of Santa Ana, and again elected president; and was re-elected president in 1865 and 1868. During his last term he signed treaties with the United States (29 Nov. 1869) for the annexation of Santo Domingo to the United States, and for the cession of Samana Bay. The treaties failed of ratification in the United States Senate, and caused the downfall of Baez.

Baeza, bä-ā'thȧ, Spain, a town of Andalusia, 22 miles east-northeast from Jaen. It is pleasantly situated on a height amid rich and well-watered plains, and from a distance presents a very striking appearance with its old walls, churches, and steep-roofed houses. It has several good streets and three squares, one of which is lined by a range of porticoes. The principal edifices are the cathedral, the old Aliatares tower, the town-hall with a fine façade, and an old monastery, now a theatre. Pop. (1902) about 14,300.

Baffa, bäf'fȧ, a seaport on the southwest coast of Cyprus. It occupies the site of New Paphos, which, under the Romans, was full of beautiful temples and other public buildings.

Baf'fin, William, English navigator: b. about 1584; d. 23 May 1622. He visited west Greenland as a pilot in 1612, again in 1615, and made voyages to Spitzbergen in 1613 and 1614. In 1616 he ascertained the limits of that vast inlet of the sea since distinguished by the appellation of Baffin Bay, and also discovered and named Smith's Sound, Lancaster Sound, etc. In 1617–22 he was in the employment of the East India Company, and on board vessels belonging to them in the Indian seas. He was killed at the siege of Ormuz, on the Persian Gulf.

Baffin's Bay, an inland sea or gulf in North America, between Greenland and the lands or islands north of Hudson Bay, extending from 68° to 78° N., and 55° to 80° W. It communicates with the Atlantic Ocean by Davis Strait on the south, with the Arctic Ocean by Lancaster Sound and Jones Sound on the west, and with the Polar Sea by Smith Sound and Robeson Channel on the north. Depth, 200 to 1,050 fathoms. The tides do not rise more than 10 feet. The surface of the sea is covered with ice during the greater part of the year, which extends from shore to shore in winter, though possessing a slow, southward movement. In spring and summer, the great mass, known as the middle ice, begins to move less slowly southward, leaving navigable passages on the

side of Greenland and America, and occasional channels, or crossings, between these coasts. The coasts are mountainous, barren, and deeply indented with gulfs. Whale and seal fishing is followed. This sea was discovered by the English navigator, Baffin (q.v.), in 1616, while in search of a passage to the Pacific.

Baffin Land, an island in the Arctic regions west of Greenland. Its area is not exactly known.

Bafulabe, bä'fü-lāb, a town of the French Sudan, at the junction of two head-streams of the Senegal, connected by railway with Kayes on that river.

Bagamoyo, bä'gạ-mō'yō, a seaport and commercial centre of German East Africa opposite Zanzibar, and north of Dar-es-Salaam. Though it has no harbor, and its coast is often swept by hurricanes, it has a considerable trade in ivory, copra, caoutchouc, etc. It has a fort, government house, custom-house, post-office and telegraph building, station of the German East African Association, government school, etc. The climate is unhealthy for Europeans. Pop. about 18,000.

Bagasse, bạ-găs', the name given to sugar cane in its dry, crushed state, as delivered from the mill, and after the main portion of its juice has been expressed; used as fuel in the sugar factory, and called also cane trash.

Bagatelle, băg'ạ-tĕl', a table ball game of the class of billiards, played on a table semicircular at the top end. The tables vary from 6 to 7 feet in length and are usually about 3 feet 6 inches wide. The game is played by two or more, one against the other. There are nine balls, eight white and one black, and nine holes sunk in the far end of the table in a diamond shape, numbered respectively 1, 2, 3, 4, 5, 6, 7, 8, 9.

The black ball is placed on a spot * in front of the foremost hole. The player then takes one of the white balls, and placing it within a balk line at the lower end of the table, strikes it with the cue in such a manner that it strikes the black ball; both balls go on their courses and fall, or not, into one or other of the open cups. Whichever cup the black ball falls into counts double the number of points normally allotted to it. Then the player, in like manner, plays the remaining seven balls up the table. For so many cups as he fills he counts up his dots, and that is his score. The highest wins.

Bagau'dæ, or **Bagaudi,** a body of Gallic insurrectionists of the rural class, who revolted against the Romans 270 A.D., headed by one Victoria, called by the soldiers Mother of Legions. Claudius temporarily quelled them, and Aurelian, by a remission of their taxes in arrears, and by granting them a general amnesty, made peace with them. Under Diocletian, 280 A.D., they rose again, and their two leaders assumed the title of emperor; but they were soon compelled to capitulate, though they retreated to an island formed by the confluence of the Marne and Seine, and made a desperate stand for the victory. The place of this sanguinary contest was long known as the *Fosses des Bagaudes.* From this period, the Bagaudæ may be considered as gradually transforming their activity into a kind of brigandage, which infested the forests and fastnesses of Gaul until the end of the Western Empire.

Bag'by, George William, American physician and humorist: b. Buckingham County, Va., 13 Aug. 1828; d. 29 Nov. 1883; educated at Delaware College; wrote under the pseudonym, Mozis Addums. He was editor of the Lynchburg *Express* (1853), and 'Southern Literary Messenger' (1859); State Librarian of Virginia (1870–8), and contributor to various magazines. He wrote 'John M. Daniel's Latchkey' (1868); 'What I Did With My Fifty Millions' (1875); and 'Meekins' Twinses' (1877).

Bag'dad, a town in Tamaulipas, Mexico, near the mouth of the Rio Grande, the port of Matamoras. It was of great importance during the Civil War to Confederate blockade runners.

Bag'dad, capital of the Turkish vilayet of Bagdad, situated on the Tigris. The old Bagdad, the residence of the caliphs, said to have had 2,000,000 inhabitants, was situated on the western bank of the river. The modern city lies mostly on the eastern bank of the river and is surrounded with a brick wall about six miles in circuit, partly in a ruinous condition, and with a ditch from five to six fathoms deep, intended to be filled with water from the Tigris. The houses, mostly built of brick, are but one story high, the streets unpaved, and so narrow that two horsemen can scarcely ride abreast. The houses of the wealthy are distinguished by a better architecture. Of the mosques, about 100 in number, only a few attract much notice, and many are in ruins. Their architecture is in general inferior to that of other Mohammedan cities, but they have a gaudy appearance from the glazed tiles covering their domes and minarets, and arranged in a kind of mosaic work in various colors. The bazaars are spacious and well stocked with goods. That built by Daoud Pasha still ranks as one of the most splendid in the world. Bagdad long commanded a large part of the traffic between Europe on the one hand, and Persia and India on the other. The Persian and Indian trade is still considerable, as also that with Europe, a large portion of it being carried on by steamers up and down the river. The trade with Europe was formerly more largely by land, passing through the Syrian Desert to Damascus, or by way of Armenia northward. Since the opening of the Suez Canal the sea routes are of far more importance. Wool is the chief export to Europe, others being wheat, gum, galls, dates, etc. The heat of the summer is oppressive in Bagdad, but the winter is cold enough to make a fire necessary. The climate is on the whole agreeable and healthy, though sometimes the plague prevails. Bagdad is inhabited by Turks, Arabs, Persians, Kurds, Armenians, Jews, and a small number of Christians. The Turks compose three fourths of the whole population. The Jews are confined to a certain district of the city, and are in a very oppressed condition. The population of the city, according to the most recent estimate, amounts to between 175,000 and 200,000.

Bagdad was founded in 762 by the Caliph Almanzor, and was raised to a high degree of splendor in the 9th century by the famous Harun al-Rashid, who figures so often in the 'Arabian Nights.' It then became the chief city in the Moslem world and a great centre of culture and learning. In the 13th century it was stormed by Hulagu (Holagou), grandson of Genghis-Khan, who caused the reigning caliph to be slain and overthrew the caliphate. The descendants of the conqueror were expelled in 1392 by Tamerlane. In the 15th century Shah Ismael, the first sovereign of Persia of the house of Sofi, took possession of the city. From that time it was a perpetual subject of contest in the wars between the Turks and Persians. After a memorable siege in 1638 it was conquered by the Turkish emperor, Murad IV., and Nadir Shah endeavored in vain, in the 18th century, to wrest it from the Turks.

Bage, Robert, English novelist: b. Darley, Derbyshire, 29 Feb. 1728; d. Tamworth, 1 Sept. 1801. He began to write at the age of 53. Among his works were: 'Mount Henneth' (1781); 'Barham Downs' (1784); 'Hermsprong, or Man as He Is Not' (1796), etc. The French social theories then prevailing were embodied in his novels.

Bagehot, Walter, English economist, journalist, and critic: b. Landport, Somersetshire, England, 3 Feb. 1826; d. Landport, 24 March 1877. Bagehot's career was in an uncommon degree marked for him at the outset. His father, Thomas Watson Bagehot, was vice-chairman of the Somersetshire bank, founded by Samuel Stuckey in the 18th century. His mother, a niece of Stuckey, a woman of much character and lively mind, had, through an earlier marriage, been brought into an excellent intellectual atmosphere from which, says Hutton, "she greatly profited." Bagehot, a boy of naturally keen mind and with a habit of reading, was educated with much good judgment. He first attended school in Bristol, whence, in 1842, he entered University College, London, graduating B.A., in 1846, and M.A., with much honor in philosophy and political economy, two years later. He was also distinguished as a mathematician and was widely read in poetry, metaphysics, and history. Then he took to reading law, but, though very fond of the study and though called to the bar in 1852, he never practised. Instead he entered the banking business under his father in Landport. He had previously, in 1851, spent some time in Paris during the exciting days of the *coup d'état* of Napoleon III. His first essays in journalism were accounts of the affairs of France contributed to a little weekly newspaper, the *Inquirer*. Herein Bagehot astounded his friends by a somewhat youthfully cynical support of the cause of Napoleon, on the paradoxical ground that the French were too clever to be successful as a self-governing people. Stupidity, according to his views at that time, was, says Hutton, essential to political freedom.

While in business, Bagehot contributed to reviews,—first to the *Prospective Review* and after 1855 to the *National Review*,—various biographical and critical articles. These, and also several sketches originally published as 'Estimates of Some Englishmen and Scotchmen' (1858), were collected after his death in 'Literary Studies' (2 vols., 1878), and 'Biographical Studies' (1880). In time they extend from 1852 to Bagehot's death. The essays "which best represent his peculiar genius" (so Hutton) are 'The First Edinburgh Reviewers,' 'Hartley Coleridge,' and 'Bishop Butler,' but such essays as those on Gibbon, Shelley, Clough, Dickens, and Wordsworth, Tennyson, and Browning, are among the most vigorous pieces of English criticism. All are distinguished by a dash and keenness of phrase and an uncommon faculty for sane and broad generalization.

In 1858 Bagehot married Miss Wilson, eldest daughter of the Right Hon. James Wilson, who had founded the London *Economist* during the anti-corn law agitation to represent free-trade sentiment. In 1860 Bagehot became editor, and there remained till his death. His practical knowledge of men, his great experience in business, and extensive studies enabled him to win success in this field, and also to write the books on which his fame as an economist chiefly rests. These are 'The English Constitution' (1867), which is extensively used as a text-book and has been translated into French, German, and Italian; 'Physics and Politics' (1872), which has been even more widely translated; and 'Lombard Street' (1873), a study of the money market. Besides the books already named there appeared after Bagehot's death 'Economic Studies,' a collection of earlier work, and 'The Depreciation of Silver.' Bagehot's counsel was much sought for in financial and economic questions. He tried on several occasions, with honesty rather than zeal, to be elected to Parliament, but never succeeded.

Bagehot, both as a student of institutions and of men, is entitled to high rank. To this study he brought, in spite of some natural prejudice in favor of the institutions and men of his native land, a mind of thoroughly scientific bent and much detachment. As a student he is interested in fundamental questions rather than in minutiæ. His broadest book, 'Physics and Politics,' is an example of this, and may be regarded as an exposition of his main methods and interests. It is an attempt to show how the principle of the survival of the fittest applies to the formation of states. The thesis is that in earliest times and even down nearly to the present, the people who had the faculty of organization and obedience, whether in family, tribe, or nation, were bound to prevail over those less organized, and that hence obedience to laws, or rulers of whatever sort was necessary to political success, until the habit of legality became ingrained. Hence the nation with the best military power could seize the best parts of the earth. If, however, the process stopped with organization, the nation would in time present a case of arrested development, and would no longer progress; for the principle of variation, or originality, is also necessary to complete progress. The best instrument for the cultivation of variation is free discussion. Hence arises the explanation of the fact that the western nations of Europe are far in advance of the rest of the world, in that they have tempered the rule of custom with discussion, which has, historically, been practically limited to peoples

of Greek and Germanic origin. And in general, on the other hand, discussion is useful in checking the impulse to hasty action, a relic of primitive civilizations. Bagehot's other longer works are really exemplifications of this principle: 'The English Constitution' is substantially an examination of the means of discussion in England and a comparison of it with that in other states; 'Lombard Street' is an analysis of one of the phenomena of variation with a view to expounding and criticising it as an efficient means of progress.

Bagehot's criticism of literature is likewise distinguished by breadth and a fondness for the analysis of causes. It is the criticism, not of taste or of morals, of the beautiful or the good and bad, but of types. The manner in which the mind of his author worked, the type of person he was, are the fundamental questions of interest with Bagehot. The title, for example, of his excellent essay on certain famous poets illustrates this: «Wordsworth, Tennyson, and Browning; or, Pure, Ornate, and Grotesque Art in English Poetry.» These poets are treated as examples of the three different types of mind and expression named in the title. Dickens is an example of the «irregular» genius, Hartley Coleridge of the whimsical and wayward mind with a gift for self-revelation, Shakespeare, among other attributes, of the experiencing mind. Bagehot's criticism is, in all these essays, never formal or academic, but is based on a wide practical knowledge of men. His point of view he maintains with great consistency, but always enlivens his criticism with such an abundance of keen and witty observations that his criticism is unsurpassed in vigor and is never dull. He, however, founded no school as certain other critics have done; for his criticism is essentially that of a lively personality and the impressionism of a scientific and detached mind.

Bibliography.—The chief authority for Bagehot, besides his own work, is R. H. Hutton ('Memoir' prefixed to 'Literary Studies,' and 'Dictionary of National Biography').

William T Brewster,
Professor of English, Columbia University.

Bag'gage, probably from the old French word *bague,* meaning bundle. As ordinarily used it includes trunks, valises, portmanteaus, etc., which a traveler carries with him on a journey. In a military sense the word includes tents, furniture, utensils, etc.

Baggara, bäg'gä-rä, an Arabic-speaking Hamitic tribe of the Upper Nile valley. They occupy this valley as far east as the territory of their neighboring negro tribesmen, the Shilluk. They are nomads, Egyptian soldiers, hunters, etc.

Baggesen, Jens, Danish poet, who also wrote much in German: b. Korsör, 15 Feb. 1764; d. Hamburg, 3 Oct. 1826. He traveled extensively in Europe, and on his return received an appointment from the Danish government. He possessed great sensibility and imagination, and his works are said to present a singular mixture of contradictory qualities. His best productions are his smaller poems and songs, several of which are very popular with his countrymen. His 'Seasons' in Danish, are much esteemed. The 'Labyrinth' is his most famous work.

Baghelkhand, bä-gĕl-kŭnd', a tract of country in central India, occupied by a collection of native states (Rewah being the chief, under the governor-general's agent for central India); area, 11,323 square miles; pop. 1,512,595.

Bagheria, bä'gā-rē'a, or **Bagaria,** a town of Sicily, eight miles east by south of Palermo by rail. It is beautifully situated at the base of the isthmus which separates the Bay of Palermo from that of Termini and is surrounded by groups of palatial villas of the Sicilian nobility. Pop. 12,650.

Bagimont's (bäj'i-mŏnts) **Roll,** a rent-roll of Scotland, made up in 1275 by Baiamund or Boiamond de Vicci, vulgarly called Bagimont who was sent from Rome by the Pope, in the reign of Alexander III., to collect the tithe of all the Church livings in Scotland for an expedition to the Holy Land. It remained the statutory valuation, according to which the benefices were taxed, till the Reformation. A copy of it, as it existed in the reign of James V., is in the Advocates' Library, Edinburgh.

Bagirmi, ba-gēr'me, a Mohammedan negro state in central Africa, situated partly between Bornu and Wadai, to the southeast of Lake Chad, and watered by the Shari, which falls into Lake Chad, and by its tributaries. It has an area of about 65,000 square miles, and about 1,500,000 inhabitants; but both its area and population fluctuate according as it encroaches on or is encroached on by its neighbors. The whole country is a plain 900 feet above the level of the sea, well suited for the cultivation of sorghum, which is accordingly the principal breadstuff. Sesame, beans, cotton, and indigo are also cultivated. The government is an absolute monarchy, but the ruler pays tribute to Wadai. Bagirmi was formerly included in one state with Bornu and Wadai. An inexhaustible supply of slaves is found in the heathen negro states to the south, at the expense of whom also Bagirmi, when pressed by its Mohammedan neighbors, extends its territory. The capital is Masena, situated about the centre of the state. By Great Britain and Germany Bagirmi has latterly been recognized as within the French sphere of influence, and in 1897 a treaty was concluded between the French government and the Sultan. There is a French resident in the capital.

Bag'ley, Worth, American naval officer: b. Raleigh, N. C., 6 April 1874; d. 11 May 1898. He was graduated at the United States Naval Academy in 1895; promoted to ensign, 1 July 1897, and was detailed as inspector to the new torpedo-boat, Winslow, in November following. This boat went into commission the next month, and he was appointed her executive officer. In April 1898 the Winslow was assigned to the American fleet off the coast of Cuba, and on 9 May, while on blockading duty at the harbor of Cardenas, with the Wilmington and Hudson, drew the fire of several Spanish coast-guard vessels. All the American vessels escaped untouched. Two days afterward the three vessels undertook to force an entrance into the harbor, when they were fired on by Spanish gunboats. The Winslow was disabled, and with difficulty was drawn out of the range of the enemy's guns. The Wilmington then silenced the Spanish fire, and as the action closed, Ensign Bagley and four sailors on the

Winslow were instantly killed by a shell, he being the first American naval officer to fall in the war with Spain.

Baglioni, bä-lyō′nę, a historical family of Perugia in Italy. Perugia contained two parties —an aristocratic and a democratic one. The Baglioni belonged to the former. In the 12th century Ludovico Baglioni was appointed imperial vicar of Perugia by Frederic Barbarossa, who styles Baglioni his relative, as coming, like himself, from the ducal house of Swabia. In 1393, 70 Perugian gentlemen, and among them two Baglionis, were killed in a street fight by the populace, and the whole aristocratic party was expelled from the city. Braccio Baglioni, in the service of the Pope, defeated Francesco Sforza, near Lodi, in 1453, and was made lord of Spello by Sixtus IV. Gian Paolo Baglioni began life as a condottiere; then availing himself of the dissensions of his native state he obtained supreme power over it and made alliance with Pandolfo Petrucci, ruler of Sienna. He was driven out of Perugia by Cæsar Borgia in 1502. Returning in 1503, after the death of Alexander VI., he was banished again, in 1506, by Julius II. He then entered the service of the Venetians in the war of the league of Cambray. He resumed his old position as ruler of Perugia in 1513. Here he created so much scandal that Leo X., who at first passed over his usurpation, summoned him to Rome, threw him into the castle of St. Angelo, had him tried, and he was beheaded at Rome in 1520. Malatesta and Orazio, his sons, recovered possession of Perugia after the death of Leo. Orazio turned condottiere in the service of France, and was killed in the Neapolitan expedition of 1528. Malatesta remained in Perugia until 1529, when he was driven out by the papal and imperial troops. He died at Perugia in December 1531. In the 16th century Astorre Baglioni served Charles V. in Italy and on the coast of Tunis, and rose high in the favor of Pope Paul III., who restored to him his paternal estates. He then entered the Venetian service, and was governor of Famagosta in Cyprus when the Turks besieged it in 1570. After a brave defense he was obliged to capitulate on condition of being sent home to Venice with his garrison. But Mustapha Pasha, disregarding the terms, caused Baglioni and the other Venetian officers to be beheaded.

Baglivi, bą-lyē-vē, **Giorgio,** Italian physician: b. Ragusa, Sicily, 1669; d. Rome, 1707. He became a disciple of the celebrated physiologist and anatomist, Malpighi; was appointed professor of medicine in the College de Sapienza, Rome, by Pope Clement XI., and afterward became professor there of anatomy. In opposition to the system known as Galenism, in medicine, he founded that of solidism, which locates all disease in the solid portions of the human anatomy. His principal writings were published under the title of 'Opera Omnia Medico-Practica et Anatomica' (1704).

Bagnacavallo, bä′nyą-ką-väl′lō, **Bartolommeo Ramenghi,** Italian painter: b. 1484; d. 1542; called Bagnacavallo from the village where he was born. At Rome he was a pupil of Raphael and assisted in decorating the gallery of the Vatican. His best works are: 'Disputation of St. Augustine' and 'A Madonna and Child,' both in Bologna.

Bagnères de Bigorre, bą′nyăr′ dĕ bę-gôr′ anciently *Aquensis Vicus, Aquæ Bigerronum*), a celebrated watering-place of France, in the department of Hautes Pyrénées, capital of the arrondissement of the same name, at the entrance of the valley of Campan, on the left bank of the Adour, 13 miles south-southeast from Tarbes. Its site is one of the most romantic in the Pyrenees. Well-cultivated slopes surround it on all sides, and are terminated in the distance by a mountain range, the most conspicuous summit in which is the Pic du Midi. The town is well built and contains several good squares and numerous spacious, handsome streets. Bagnères owes its chief celebrity to its baths, which are sulphurous and saline. The bathing establishment, called Fracasti, is very complete, and is the largest and most handsome building of the town. It stands at one of its extremities, immediately under Mount Olivet, and is approached by a long avenue of poplars winding through a verdant valley. The inhabitants depend chiefly on the baths, almost every house receiving lodgers; but the manufactures are of some importance. The chief of these are a kind of crape and a fine woolen gauze woven into shawls and scarfs. The springs here were known to and used by the Romans, and various ancient remains are still in existence. Pop. 6,907.

Bagnères de Luchon, bą′nyăr′ dĕ lü-shôn′, a town of France, in the department of Haute-Garonne, one of the principal watering-places of the Pyrenees, having sulphurous thermal waters said to be beneficial in rheumatic and gouty complaints, nervous ailments, skin diseases, etc., and used chiefly as baths. The town is situated in the picturesque valley of Luchon, surrounded by hills covered with wood. The main street forms a splendid avenue, at the west end of which the large bathing establishment is placed. There is also a large and splendid casino building of recent erection, comprising a theatre, concert and ball rooms, etc., and containing a large-scale model of the Pyrenees, giving an excellent idea of the configuration of the range. The neighborhood exhibits some of the most interesting scenery of the Pyrenees. Visitors number from 30,000 to 40,000 annually, and are most numerous in the months of July and August. Resident pop. 4,000.

Bagni, bä′nyę (Italian for "baths"), a name in Italy for various places which possess natural baths or thermal springs, distinctive appellations being appended to mark the particular locality. Thus there are Bagni San Giuliano, in the province of Pisa, and some four miles northeast of the city of that name; and Bagni di Lucca, in the province of Lucca, and about 13 miles northeast of the city of Lucca, one of the most frequented of the bathing places of Italy.

Bagot, Sir Charles, British diplomatist: b. 23 Sept. 1781; d. Kingston, Canada, 18 May 1843. He was the second son of William, first Lord Bagot. In 1807 he was appointed under-secretary of state for foreign affairs in the Canning administration; in 1814, minister to France; in 1820, ambassador at St. Petersburg; and in 1824, ambassador in Holland. On the death of Lord Sydenham he was made governor-general of the Canadas, which office he held till his demise.

Bagot, Richard, English bishop, brother of the preceding: b. 22 Nov. 1782; d. 15 May 1854. In 1829 he was made bishop of Oxford, and in 1845 he was promoted to the bishopric of Bath and Wells. During the Tractarian controversy he was violently assailed for his Puseyite predilections, and for his induction of the Rev. M. Bennett into the living of Frome. This had such an effect on Bishop Bagot that his intellect became disturbed.

Bag'pipe, a well-known wind instrument, of high antiquity among various nations, and so long a favorite with the natives of the Highlands of Scotland that it may now be considered as their national instrument. The peculiarity of the bagpipe consists in the fact that the air producing the music is collected into a leathern bag, from which it is forcibly pressed into the pipes by the arm of the performer. The *chanter*, a pipe into which is inserted a reed for the production of the sounds by the action of the air from the bag, is perforated with holes like the German flute, which are stopped with the fingers. The other parts of the instrument, in the common Highland form, are three tubes or *drones,* which are also furnished with reeds. Two of the drones are in unison with D on the chanter, which corresponds with the lowest note of the German flute. The third drone, which is the longest, is an octave lower. The tuning of the bagpipe is accomplished by lengthening or shortening the tubes or drones, as may be required. Its compass is from the G of the treble stave to the A above it, but its scale is imperfect. The Highland bagpipe is a powerful instrument, and calls for great exertion of the lungs, the air being forced into the bag by a pipe held between the lips. The Irish bagpipe is smaller, softer in its notes, and is always played with bellows that force the air into the bag. It has a number of keys on the chanter and drones, and is a much more perfect instrument musically than the Highland. A Lowland Scotch form of the bagpipe is also played with bellows. It is not known when the bagpipe first found its way into Scotland, but it is probable that the Norsemen first introduced it into the Hebrides, which islands they long possessed. In England it was common from Anglo-Saxon times, and is familiarly referred to by Chaucer and Shakespeare. The bagpipe is indeed of very ancient origin, as representations of it are to be found on Grecian and Roman sculptures; and it has long been well known among various eastern nations. In Italy to this day, or at least in certain parts of it, the bagpipe is still a popular instrument among the peasantry, but the Italian form of it is more simple than the Highland and Irish.

Bagratidæ, băg-ra'tĭ-dē, or **Bagratians,** a line of kings and princes of Armenia that ruled in that country from the year 885 to the 11th century. After the seizure of Asia Minor by the Seljuks, some of the princes retained power as independent lords, holding the possession of mountain fastnesses. The dynasty ended with Leo IV., who was assassinated in 1342.

Bagration, bą-grä'tę-ōn', **Peter, Prince,** Russian general, of the Georgian Bagradite family: b. about the year 1762; d. 7 Oct. 1812. He entered the Russian army in 1782 as a common soldier; and in a long military career rose to the highest grades, and gained a place among those Russian generals the most celebrated for their stubborn, unyielding bravery. Having been created a lieutenant-general, he commanded the vanguard of the Austrian army at Austerlitz, under Prince Lichtenstein. In the Prussian campaign of 1807, his resistance made the battle of Eylau so terrible that even Napoleon shuddered at its bloody results. The same is said of him at the battle of Friedland. In 1808 he overran Finland, western Bothnia, and the Aland isles; in 1809 he fought at Silistria, and destroyed the Turkish force brought up from Adrianople to relieve that fortress. In 1812 he fought an unsuccessful battle with Davoust at Mohileff, but succeeded, nevertheless, in joining the Russian main army. He was mortally wounded at the battle of Mojaïsk or Borodino, 7 Sept. 1812, just a month before he died.

Bag'shaw, Edward, English author: date of birth unknown; d. 1662. He espoused at first the cause of the Puritans, but later became a Royalist, and sat in the parliament that Charles I. convened at Oxford; was taken prisoner by the Parliamentary army, and, during his detention, composed various books, the most important of which is 'The Right of the Crown of England as Established by Law.'

Bagshot Heath, a level tract in England, now used as a field for military manœuvres. It is famous as the site of many highway robberies in the 18th century.

Bag'stock, Major Joe, an apoplectic, gluttonous character in Dickens' novel, 'Dombey and Son.'

Bagworm, or **Basketworm,** a common caterpillar of a moth (*Thyriadopteryx ephemeræformis*), found in large numbers throughout the northern part of the United States. The male has a dark body and light wings, but the egg-laying female is wingless. The larva lies head downward in a sac or case covered with bits of leaves (so that it looks like a basket), where it finally transforms, the worm-like female remaining in its case, while the male flies sluggishly about, and may be known by its hairy body and small transparent wings. When the young hatch (in May), they crawl on a leaf, gnawing little bits from the surface and fastening them together with a thread. They present a comical sight when the baskets are partly completed, walking about, tail in the air, with the body hidden in the case. As they grow older the body is entirely protected by the sac, which they drag about when in motion. These insects frequent the trees in city parks, especially junipers, in great numbers, and are apt to be detrimental to foliage unless destroyed by scraping off the cocoons. Certain small species occur on the orange in Florida, and others in the tropics. See FAGGOTWORM.

Bahadur, bą-hâ'door, the last Great Mogul from the house of Tamerlane: b. 1767; d. 1862. When the British captured Delhi, he was taken prisoner, and sent to Rangoon. He was also a poet and wrote a number of songs.

Baha'ma Bank, Great and **Little,** shoals among the West India Islands; the former between 22° and 26° N., 75° and 79° W., having south and west the Bahama old and new channels. On it are the islands of Providence, Andros, and Exuma. The Little Bank, northwest of the foregoing, between 26° and 27° N., 77°

and 79° W., has on it the Great Bahama and Abaco Islands.

Baha'ma Channel, Old and **New,** two channels of the West Indies; the former separates the Great Bahama Bank and Cuba; the latter, also called the Gulf of Florida, is between the Great and Little Bahama Banks and Florida, and forms a part of the channel of the great Gulf Stream, which flows here at the rate of from two to five miles an hour.

Bahamas, The, or **The Bahama Islands,** were formerly known as the Lucayos, from the name of a tribe of aborigines inhabiting them at the time of their discovery by Columbus in 1492. The scene of the first landing was an island on the outer or Atlantic side of this group to which Columbus gave the name San Salvador. By the natives that island was called Guanahani, and it is now known as Watling Island. The total habitable area of the islands is small, but the extent of the group, including cays and rocks rising from banks near the surface of the water, is very great — nearly six degrees of latitude, and more than six degrees of longitude. Stretching through a total distance of 780 miles, these islands and banks form a barrier between the Atlantic and the eastern entrance to the Gulf of Mexico. To reach the Florida Strait, a large vessel must follow one of three channels: the Old Bahama, north of Cuba; the Florida, and the Providence. The last passes through the group above Nassau, the capital and only important city, an attractive place with about 10,000 inhabitants.

The researches of Prof. Agassiz have shown that the Bahamas are essentially different in geological formation from the Greater and Lesser Antilles, being «wind-blown piles of shell and coral sand,— once much more extensive than now,— whose areas have been restricted by a general regional subsidence of some 300 feet, so that much of their former surface now occurs as shallow banks beneath the water. Mr. Robert T. Hill says: «The islands are merely the exposed tips of a great submerged ridge, having an outline and configuration which would be crudely comparable to the island of Cuba if the latter were so submerged that its highest points merely reached the surface.»

The Indian population having been carried away to the pearl fisheries of Panama, or to labor in the fields and mines of other Spanish colonies, the Bahamas remained deserted until, in 1629, an English settlement was begun in the island of New Providence. Twelve years later, Spain asserted her claim, based upon discovery without occupation. The English were expelled, but again attempted colonization; and Charles II., in 1680, actually granted the islands to six English noblemen and gentlemen. Early in the 18th century New Providence was twice raided by French and Spanish forces; and again it became a desert. Buccaneers of all nations made themselves at home, and held undisputed possession, until another English settlement was planted in 1718, and British troops assigned to its defense. Tory emigrants from the English colonies on the mainland at the time of the Revolution introduced slave labor and the cultivation of cotton — which did not thrive. New Providence was captured and held for a short time by the Americans under Commodore Hopkins in 1776; six years later it fell into the hands of the governor of Cuba, but was retaken by the loyalist Col. Deveaux before 12 months had passed. The rights of the old lord proprietors were purchased in 1787, the Bahamas becoming a possession of the British Crown, administered by a colonial government.

During the Civil War in the United States an enormous blockade-running trade swelled the imports of the islands from a little more than $1,000,000 to upward of $26,000,000; the exports from about $800,000 to more than $23,000,000 — a period of prosperity both brief and unique. Violent storms and droughts have more than once brought ruin to the natural industries; the cultivation of small fruits, vegetables, oranges, pineapples, cocoanuts, etc., has been carried on at a disadvantage, owing to the tariff laws of the United States, and the remoteness of other markets. Other forms of agriculture have been attempted, with moderate success. Sponge-fishing is carried on extensively. At the eastern end of the group are the Turks and Caicos islands, which were separated politically from the Bahamas, and made a dependency of Jamaica in 1848. Grand Turk is the capital, and there the chief executive officer, or commissioner, resides. From these islands 1,500,000 bushels of salt are exported annually, and a large number of sponges are also gathered and exported. The total value of imports to all the islands is about $825,000, the United States supplying nearly three fourths of that amount. Besides Turks and Caicos, the principal inhabited islands are: New Providence, with about 15,000 inhabitants; Abaco, Harbor Island, Eleuthera, Mayaguana, Ragged Island, Rum Key, Exuma, Long Island, Long Key, the Biminis, Great Bahama, Crooked, Acklin, Cat, Watling, Berry, and the Andros Islands. The inhabitants of Great Abaco are chiefly descendants of the American Tories, referred to above. Harbor Island has about 2,000 inhabitants, who are descendants of the buccaneers. Largest and most densely wooded are the Andros Islands.

From November to May the temperature ranges between 60° and 75° F.; in the summer months it varies from 75° to 85°. The climate, though subject to greater extremes of heat and cold than that of other groups in the West Indies, is agreeable and health-giving; and Nassau is a favorite resort for tourists in winter. The population (about 54,000), includes a large proportion of negroes, the natural increase among the descendants of former slaves being greater than among the descendants of the white settlers. There is little immigration. Good schools are maintained by the government, and by the Church of England. The administration of the islands is conducted by a governor, and an executive council. Members of the representative assembly, 29 in number, are elected by suffrage. There is a legislative council. From Nassau cables run to Florida and the Bermudas. A line of steamers connects the capital with London, and there is regular mail connection with New York and Florida.

Authorities.— 'Cuba and Porto Rico, with the Other Islands of the West Indies,' by Robert T. Hill; 'Amerika,' by Rudolf Cronau.

MARRION WILCOX,
Authority on Latin-America.

Bahar, bạ-här′, province in India. See BEHAR.

Bahar, bạ-här′, or **Barre,** the name of certain weights used in several places in the East Indies. They have been distinguished as the *great bahar,* with which are weighed pepper, cloves, nutmegs, ginger, etc.; and the *little bahar,* with which are weighed quicksilver, vermilion, ivory, silk, etc. But this weight varies much in different parts of the East, being in some places not much above 400 pounds, in others considerably over 500.

Bahawalpur, bạ-hä′wạl-poor′, India, town and capital of a state of the same name in the Punjab, two miles from the Sutlej. It is surrounded by a mud wall and contains the extensive palace of the Nawab, a vast square pile with towers at the corners. It has underground rooms, which afford a more comfortable temperature in the warm season than the upper rooms. Silk goods are manufactured. Pop. about 14,000. The state has an area of 17,285 square miles, of which 10,000 is desert, the only cultivated lands lying along the Indus and Sutlej. Cultivation largely depends upon irrigation, which has been considerably extended in recent times, with a great increase to the state revenue. The chief crops are cereals, cotton, and indigo. The political relations between the British government and the state are regulated by a treaty concluded in 1838. No tribute is exacted from the Nawab. Pop. 720,700.

Bahia, bä-ē′ạ, or **São Salvador da Bahia,** so named because it is situated on a large harbor or bay, ranks, in population and importance among the cities of Brazil, next to Rio de Janeiro. It lies about 740 miles north of Rio, in lat. 13° 1′ S., and lon. 38° 32′ W. Amerigo Vespucci visited this port on his voyage of exploration in 1503. Before 1763 Bahia was the capital of Brazil, and in the 16th century it was the scene of frequent conflicts between the Portuguese and the forces of other European nations (see BRAZIL). At present it is the capital of the state of Bahia, which has great natural resources in its mines and forests, as well as in fertile lands devoted largely to the cultivation of sugar-cane. The location of the city is picturesque, its upper portion being built on high ground several hundred feet above the sea-level. On the upper terraces stand churches, the cathedral, convents, a great theatre, the mint, and the governor's palace. Below, bordering the port, which has a fine lighthouse and is defended by several forts, are docks and warehouses where the products of the country,— coffee, sugar, cotton, dye-woods, tobacco, rum, hides, horns, and tallow,— are collected, to be shipped to all parts of the world. Bahia has an excellent public library, which was founded in 1811; its manufactures have received attention in recent years, and formerly it was the headquarters of the diamond trade before the mines of South Africa and southern Brazil were developed. The population is somewhat more than 200,000, with an annual increase of nearly 6,000.

MARRION WILCOX.

Bahia Blanca, bä-ē′ạ blän′kạ, Argentina, an important seaport town in the state of Buenos Ayres. The town has an excellent harbor and is the seat of a considerable foreign trade. The United States is represented by a consular agent. Pop. (1903) 11,600.

Bahia Honda, bä-ē′ạ ōn′dạ, a seaport of Cuba, on the coast of the Gulf of Mexico, and lying on a small bay, bearing the same name, which affords one of the best harbors on the island. The town and bay are about 50 miles west of Havana, being commanded by a small fort. There are mines of coal and copper in the vicinity. A short distance to the south are the sulphur springs of Aguacate.

Bahr, bär, **Johann Christian Felix,** German philologist: b. Darmstadt, 13 June 1798; d. 29 Nov. 1872; educated at Heidelberg Gymnasium and University, of which last he became ordinary professor of classical philology in 1823. His chief work is his 'History of Roman Literature' (1828; 4th ed. 1868–70), which is noted for its clearness and comprehensiveness. Three supplements to this work deal with the 'Christian Poets and Historians of Rome' (1836); the 'Christian-Roman Theology' (1837); and the 'History of Roman Literature in the Carlovingian Period' (1840). His edition of 'Herodotus' (2d ed. 1855–61) is also noteworthy.

Bahr, bär, an Arabic word signifying sea or large river; as in Bahr-el-Huleh, the Lake Merom in Palestine; Bahr-el-Abiad, the White Nile, Bahr-el-Azrek, the Blue Nile, which together unite at Khartum.

Bahr-el-Ghazal, bär′ĕl-gạ-zäl′, name of two rivers in central Africa: one flows from Lake Chad through a desert region; the other is formed by the union of several streams near the Congo Free State, and flows eastward through a very swampy region, and shortly after leaving Lake No unites with the Bahr-el-Jebel to form the White Nile. Its banks are apt to be very indefinite owing to inundations. In 1869 Schweinfurth explored the greater part of its basin. The head of steam navigation on the river is Meshra-er-Rek. The basin of these two rivers is a province of the same name. A settled government was established there on behalf of Egypt in 1878, but the Mahdist rebellion temporarily severed its connection with that country. Since the reconquest of the Egyptian Sudan by the British and Egyptian forces under Kitchener, however, the Bahr-el-Ghazal has been again brought under a settled administration. It is said to be rich in ivory, rubber, and timber, and suited for cotton growing. The Ubangi district of the French Congo lies to the west of the Bahr-el-Ghazal.

Bahr Yusuf, bär yoo′sŭf, or **Bahr el Yusuf,** an artificial irrigation channel from the left bank of the Nile below Sint, to the Fayum; 270 miles long. According to Coptic traditions it was constructed during Joseph's administration.

Bahraich, bạ-rīch′, a town of Hindustan, capital of Bahraich district, Faizabad division, Oudh. The town is in a flourishing state; it is drained and lighted, and carries on a good local trade. The chief edifice of interest is the shrine of Musand, a warrior and saint of the 11th century, which attracts both Hindu and Mohammedan pilgrims to the number of 150,000 annually. The American Methodist mission has a station and a school here. Pop. about 24,000.

Bahral, bä'räl, or **Burrel,** a wild sheep (*Ovis nahura*) of the high plains of Tibet, which resembles a goat in appearance, although it has no beard. The rams carry large flattened and nearly smooth horns, which curve outward and backward, but do not curl. The general color is brown, becoming gray in winter, while the abdomen and insides of the legs and tail are white; a stripe along the sides and on each side of the face, the throat, and the front of the legs, are black, interrupted by white patches at the knees and above the hoofs. The females are plainer and have small horns. This animal, which is a favorite object of sport in Tibet, passes its whole time above the limit of forest growth, and clambers about the rocks in the manner of a goat rather than of a sheep. It is believed that these animals, which are often kept captive by the mountaineers, have influenced the Asiatic races of domestic sheep. Consult Lydekker, 'Royal Natural History,' Vol. II. (London 1895).

Bahrdt, bärt, **Karl Friedrich,** German theologian: b. Bischofswerda, Saxony, 25 Aug. 1741; d. Halle, 23 April 1792; studied in Schulpforte and Leipsic, where he first showed his great talents. In 1762 he was appointed professor in the University of Leipsic. His works and his talents as a preacher procured him many admirers, but in consequence of immoral conduct he was obliged to quit that city in 1768. From this time he led an unsettled life. He was successively professor of theology and preacher in Erfurt (where he was made doctor of theology), in Giessen, Switzerland, and in Dürkheim, but was obliged to leave each of these places on account of his severe attacks on the clergy and the heterodox views manifested in his writings and sermons, as well as on account of his irregular life. The Aulic Council declared him disqualified to preach or to publish unless he would revoke the religious principles advanced in his works. In 1779 he went to Halle, where he published his creed. It is thoroughly deistical, denying the miracles, and not insisting on the immortality of the soul. He lectured in Halle, but soon became involved in difficulties with the clergy; upon which he left the city, and established, in a neighboring vineyard, a public-house, where he had many customers, whose vitiated tastes and depraved habits he made no scruple of gratifying. Ultimately, in consequence of two works which he wrote, the patience of government was exhausted. He was brought to trial, condemned, and confined in the fortress of Magdeburg. Here he wrote his life. At the end of a year, having regained his liberty, he again opened his public-house at Halle, where he died.

Bahrein, ba-rān', or **Aval Islands,** a group of islands lying on the south side of the Persian Gulf, since 1867 under British protection. The principal island, usually called Bahrein, is about 27 miles in length and 10 in breadth. It is in general very flat and low, a mere shoal hardly 20 feet above sea-level; though in the centre there are hills 400 feet high. The soil is not fertile except in some places, and is often cultivated by means of irrigation. Excellent dates are produced. Fishing is an important industry, and the pearl-fishery here is famous. The inhabitants are a mixed race. The principal town is Manameh or Manama; pop. 25,000. The island of Moharrek, separated from Bahrein by a strait two miles broad and only about three feet deep at ebb, is much smaller than it; but contains a town called also Moharrek, which is the present seat of government, and has a population of 22,000. The islands are governed by a sheikh. The total population is estimated at 70,000.

Baiæ, bī-ē, Italy, a place where wealthy Romans had their summer homes, the favorite abode of the dancing-girls and the buffoons. It is now deserted, and interesting to the stranger only for the ruins of old baths, which are shown as temples, and for the remains of former palaces, visible beneath the waves of the sea. Baiæ owes its fame to its hot baths, and its situation on a most charming bay, secured by surrounding hills from the violence of the winds. The life of the Romans there was particularly luxurious and dissolute. It has now entirely lost its ancient position of importance.

Baidyabati, bād'ya-bä'tē, a town of Bengal, situated on the river Hugli, about 15 miles from Calcutta, with an important market for jute and other produce. Pop. about 18,400.

Baif, bä-ē, **Jean Antoine de,** French poet: b. 1532; d. 1589; one of the literary league known as the 'Pléiade,' and the chief advocate of its plan of reducing French poetry to the metres of the classic tongues; also a spelling reformer, in favor of the phonetic system. His most meritorious works were translations of Greek and Roman dramas.

Baikal, bī-käl', a lake of Siberia, 360 miles long from southwest to northeast, and from 20 to 53 in breadth, interspersed with islands; lon. 104° to 110° E.; lat. 51° 20′ to 55° 20′ N. It contains seals and many fish, particularly sturgeons and pikes. In the environs are several sulphurous springs, and in one part, near the mouth of the river Barguzin, it discharges a kind of pitch which the inhabitants purify. The water is sweet, transparent, and appears at a distance green, like the sea. It receives the waters of the Upper Angara, Selinga, Barguzin, and other rivers; but the Lower Angara is the only one by which it seems to discharge its waters. It is enclosed by rugged mountains, and the scenery is unusually magnificent. In summer the lake is navigated by steamboats, but it is frozen from November to April, and trade is carried on over the ice.

Baikie, bā'ki, **William Balfour,** English naturalist and traveler: b. Kirkwall, Orkney, 1825; d. 12 Dec. 1864. He studied medicine at Edinburgh, and after receiving his degree entered the royal navy as assistant surgeon. He served in the Mediterranean, was assistant surgeon at Haslar Hospital in 1851–4, and was then appointed surgeon and naturalist to the Niger expedition, which was about to start for the exploration of this river. The death of the captain of the exploring vessel the Pleiad, left him in chief command, and he succeeded in reaching a point 250 miles higher up the river than had previously been attained. On a second expedition he was able to establish a settlement at the confluence of the Niger and Benue, and in a few years did much to spread civilization among the natives of the neighboring regions. He was author of 'Observations on the Haussa and Fufulde Languages,' and joint author with R. Heddle of 'Mammalia and Birds Observed on the Orkney Islands.'

Baiktashi, bīk-tä'shę. See DERVISHES.

Bail, in law, is the delivery of a person to another for keeping, and is generally used in reference to one arrested, or committed to prison, upon a criminal process, such person being said to be *bailed* when he is delivered to another (or is supposed to be so, but is simply set free from custody), who becomes his surety (to a greater or less amount according to the crime with which he is charged) for his appearance at court to take his trial. The person who thus becomes surety is said *to become bail,* and the amount itself is also called *bail.* Bail may generally be granted except in the case of treason. The word is not used as a plural.

When the punishment by the law of the United States is death, bail can be taken only by the supreme or circuit court, or by a judge of a district court of the United States. The proceedings attendant on giving bail are substantially the same in England and in all States of the United States. An application is made to the proper officer, and the bond or the names of the bail proposed filed in the proper office, and notice is given to the opposite party, who must except within a limited time, or the bail justify and are approved. If exception is taken, notice is given, a hearing takes place, the bail must justify, and will then be approved unless the other party oppose successfully; in which case other bail must be added or substituted. A formal application is in many cases dispensed with, but a notification is given at the time of filing to the opposite party, and unless exceptions are made and notice given within a limited time, the bail justify and are approved.

Bail'ey, Gamaliel, American journalist: b. Mount Holly, N. J., 3 Dec. 1807; d. 5 June 1859; was editor of the *Methodist Protestant* at Baltimore; with J. G. Birney founded the anti-slavery journal, the 'Cincinnati Philanthropist' (1836), the office of which was destroyed by a mob, though it continued to be published till 1847; after 1843 was also editor of a daily paper, *The Herald.* He established the well-known newspaper, the Washington *National Era* (1847), in which the famous novel, 'Uncle Tom's Cabin,' appeared first.

Bail'ey, Jacob Whitman, American scientist: b. Auburn, Mass., 29 April 1811; d. 26 Feb. 1857; was graduated at the United States Military Academy in 1832; and from 1834 till his death was professor of chemistry, mineralogy and geology at the Military Academy. He was the inventor of the Bailey indicator and of many improvements in the microscope, in the use of which he achieved high distinction; and he is regarded as the pioneer in microscopic investigation. He was president of the American Association for the Advancement of Science in 1857; and was author of numerous papers on the results of his researches.

Bail'ey, James Montgomery, American humorist: b. Albany, N. Y., 25 Sept. 1841; d. 4 March 1894; served in the 17th Connecticut regiment during the Civil War; returned to Danbury, founded the Danbury *News* in 1870. He wrote 'Life in Danbury' (Boston 1873); 'Danbury News Man's Almanac' (1873); 'They All Do It' (1877); 'The Danbury Boom' (1880); etc.

Bail'ey, Joseph, American military officer: b. Salem, O., 28 April 1827; d. 21 March 1867; entered the Union army as a private in 1861, and signally distinguished himself in the Red River campaign under Gen. N. P. Banks, in 1864 by building a dam and deepening the water in the channel, which enabled Admiral Porter's Mississippi flotilla to pass the Red River rapids in safety and so escape the perilous situation. For this engineering feat, Bailey, who before entering the army was a plain farmer, was brevetted brigadier-general, promoted colonel, voted the thanks of Congress, and presented by the officers of the fleet with a sword and a purse of $3,000. Subsequently, he was promoted to full brigadier-general, and was engaged on engineering duty till his resignation 7 July 1865.

Bailey, Joseph Weldon, United States senator for Texas: b. Copish County, Mo., 6 Oct. 1863. He studied for the legal profession, graduated as a lawyer in 1883, and, entering politics, in 1884 served as a district elector on the Cleveland and Hendricks ticket. The following year he removed to Gainesville, Texas, and in 1888 served as elector for the State at large on the Democratic ticket. He was elected to the Fifty-second, Fifty-third, Fifty-fourth, Fifty-fifth, and Fifty-sixth Congresses, and was the Democratic nominee for speaker of the House of Representatives on the organization of the Fifty-fifth Congress, 15 March 1897. He was chosen to succeed the Hon. Horace Chilton as United States senator for Texas, 23 Jan. 1901, and was re-elected 22 Jan. 1907.

Bail'ey, Liberty Hyde, American horticulturist: b. South Haven, Mich., 15 March 1858; graduated at the Michigan Agricultural College in 1882; was associate to Dr. Asa Gray at Harvard University in 1882–3; professor of horticulture and landscape gardening in the Michigan Agricultural College in 1883–8; in the last year became professor of horticulture in Cornell University; and in 1903 was appointed director of the College of Agriculture at Cornell. He was an associate editor of the revised edition of 'Johnson's Universal Cyclopædia' (1892–6), and editor of 'American Gardening.' He has published a large number of technical works, including 'Annals of Horticulture,' 'Evolution of Our Native Fruits,' 'Text-book of Agriculture,' etc.

Bail'ey, Loring Woart, chemist and geologist: b. West Point, N. Y., 28 Sept. 1839. He graduated at Harvard in 1859, and in 1861 was appointed professor of chemistry and natural history in the University of New Brunswick, Fredericton, N. B., since which date he has also been connected with the geological survey of Canada. Besides his official reports he has published: 'New Species of Microscopical Organism from the Para River, South America' (1861); 'Mines and Minerals of New Brunswick' (1864); 'Geology of Southern New Brunswick' (1865); 'Elementary Natural History' (1887).

Bail'ey, Nathaniel (or NATHAN), English lexicographer: d. 1742. He was the author of an English dictionary, the best before that of Dr. Johnson. The first edition appeared in 1721 under the title of 'An Universal Etymological English Dictionary,' by N. Bailey; and

it was soon republished in an enlarged form. Altogether some thirty editions of it appeared up to 1802. Dr. Johnson made use of an interleaved copy of it when drawing up his own dictionary. Bailey also published a spelling-book: 'All the Familiar Colloquies of Erasmus, Translated'; 'The Antiquities of London and Westminster'; 'Dictionarium Domesticum,' etc.

Bail'ey, Philip James, English poet: b. Nottingham, 22 April 1816; d. 6 Sept. 1902. He was educated first in his native city and afterward at Glasgow University; was called to the bar, but never practised. His best known poem, 'Festus,' was first published in 1839, and has passed through a very large number of editions, both in Great Britain and the United States. He is author of a few other poems and of one prose work; among the former are 'The Age' (1858), a satire, and 'The Angel World' (1850), now incorporated with 'Festus.'

Bail'ey, Samuel, English banker and writer on political and mental philosophy: b. Sheffield. 1791; d. 18 Jan. 1870. His first work was a volume of 'Essays on the Formation and Publication of Opinions' (1821), in which he ably defended the proposition that a man's opinions are independent of his will. His 'Essays on the Pursuit of Truth and on the Progress of Knowledge' (1829) are only less valuable. His many controversial books on questions of political economy are already almost forgotten, though these, as well as his pamphlets and treatises on political representation, primogeniture, and the like, are characterized alike by terse exposition and vigorous style. Not less interesting are his 'Review of Berkeley's Theory of Vision' (1842); 'Theory of Reasoning' (1851); and 'Letters on the Philosophy of the Human Mind' (1855–63). The third series of the last contains an able defense of utilitarianism, in which the author avows himself a thorough determinist.

Bail'ey, Solon Irving, astronomer: b. Lisbon, N. H., 29 Dec. 1854. He graduated from Boston University, 1881; and Harvard (A.M.), 1887. In 1889 he was sent to Peru to determine the best location for a southern station of the Harvard Observatory. Arequipa was selected, an observatory was built, and as associate professor of astronomy Prof. Bailey has had charge of the work there for eight years. In 1893 he established a meteorological station on the summit of El Misti, by far the highest scientific station in the world. His scientific writings have been issued in the 'Annals of Harvard College Observatory.'

Bail'ey, Theodorus, American naval officer: b. Chateauguay, N. Y., 12 April 1805; d. 10 Feb. 1877; entered the navy in 1818; served on the western coast of Mexico during the Mexican war; commanded the frigate Colorado, of the western Gulf blocking squadron, in 1861–2; and in the last year commanded the right column of Admiral Farragut's squadron in the passage of forts St. Philip and Jackson, and led the fleet at the capture of the Chalmette batteries and the city of New Orleans. In 1862–5 he commanded the east Gulf blockading squadron. He was commissioned rear-admiral and retired in 1866.

Bail'ey, Vernon, American scientist: b. Manchester, Mich., 21 June 1863; received a university education and in 1900 was chief field naturalist of the United States Biological Survey. Among his publications are 'Spermophiles of Mississippi Valley,' 'Revision of Voles of the Genus Evotomys,' 'Mammals of District of Columbia,' etc.

Bail'ey, William Whitney, American botanist: b. West Point, N. Y., 22 Feb. 1843. He was educated at Brown and Harvard, having been a pupil of Prof. Asa Gray. In 1867 he was botanist of the United States Geological Survey of the 40th parallel; in 1867-9 assistant librarian of the Providence Athenæum. He was appointed instructor in botany at Brown University in 1877, and became professor there in 1881. He has published 'Botanical Collector's Handbook' (1881), and contributed to several periodicals.

Bailey, Willis T., American statesman: b. Carroll County, Ill., 12 Oct. 1854. He was educated at the University of Illinois. In 1873 he removed to Nemaha County, Kan., and engaged in farming and stock-raising. In 1888 he was elected to the State legislature and was sent to Congress in 1899. He was elected governor of Kansas on the Republican ticket in 1903.

Bail'ie, or **Baillie,** a municipal officer or magistrate in Scotland whose jurisdiction extends to breaches of the peace, drunkenness, petty thefts, and like offenses. They sit and vote in the city councils, like other members, and are subject to the ordinary rules of retirement.

Bail'iff, a name which was introduced into England with William I., and came to be applied to various officials representing or acting for the king. He is essentially a person intrusted by a superior with power of superintendence. In the United States the word bailiff has no precise meaning. The term is most frequently used to denote a court officer whose duty it is to take charge of juries and wait upon the court. In England: an officer appointed for the administration of justice in a certain bailiwick or district. The sheriff is the king's bailiff, whose business it is to preserve the rights of the king within his "bailiwick" or county. (1) The governor of a castle belonging to the king. (2) A sheriff's officer. Bailiffs are either bailiffs of hundreds or special bailiffs. (a) Bailiffs of hundreds are officers appointed by the sheriff over the districts so called, to collect fines, summon juries, to attend the judges and justices at the assizes and quarter sessions, and to execute writs and process. (b) Special bailiffs are men appointed for their adroitness and dexterity in hunting and seizing persons liable to arrest. They assist the bailiffs of hundreds in important work for which the latter have no natural aptitude or acquired skill. Special bailiffs being compelled to enter into an obligation for the proper discharge of their duty are sometimes called bound bailiffs, a term which the common people have corrupted into a more homely appellation. (Blackstone's 'Commentaries,' book I., chapter ix.)

Bail'iwick, the jurisdiction of a bailiff, from *bailie* and *wick* (*vicus*), a town or village. In the United States it generally refers to a county, or in a jocular way is applied to any territory or place in which a person has authority.

Baillairge, bạ-yārzh', **Charles P.,** Canadian architect and civil engineer: b. Quebec, 27 Sept. 1826. Among his best known works as an architect are the Laval University, the asylum and churches of the Sisters of Charity and Good Shepherd, the Music Hall, the new jail, Dufferin Terrace, the aqueduct bridge over the St. Charles, and the Monument aux Braves de 1760, all in the city of Quebec. In 1863–5 he was joint architect and engineer with Messrs. Fuller and Page, of the parliamentary and departmental buildings in Ottawa. He is a member of the Royal Academy of Arts, Fellow of the Royal Society of Canada, and a past president of the Quebec Association of Architects. He has received many honors and diplomas from his own and other governments, and has published a large number of important works, including 'Plane and Spherical Geometry and Trigonometry' (1863); 'Key to the Stereometrical Tableau' (1870); 'Homonymes Francais' (1891); 'English Homonyms' (1891), etc.

Baillarger, bạ'yär-zhā', **Jules Gabriel,** French physician: b. 1809; d. 1891. He made a specialty of mental and nervous diseases and in 1843 joined with Longet and Cerise to establish a review especially devoted to these subjects, known as the 'Annales Medico-psychologiques du Système Nerveux.' In 1849 he received the medal of the Legion of Honor; in 1842 he received a prize from the Academy of Music for his essay on 'Des Hallucinations.'

Baillet, bạ-yā', **Adrien,** French writer: b. Neuville, 13 June 1649; d. 21 Jan. 1706. He was ordained priest in 1675, and his love for learning was so intense that after discharging for five years the duties of a parish priest, he accepted the position of librarian to Lamoignon, president of Parliament. His first publication was entitled 'Judgments of the Learned upon the Principal Works of Authors,' a book of criticism which taught better rules than it illustrated. He also produced a book on 'Devotion to the Holy Virgin,' the lives of the saints, which extended to four volumes, and a life of Descartes.

Bailleul, bạ-yēl', a French town, in the department of the Nord, near the Belgian frontier, about 19 miles west of Lille. It has manufactures of woolen and cotton stuffs, lace, leather, etc. Population, about 13,600. A village of the same name in the department of Orne gave its name to the Baliol family.

Bail'lie, Lady Grizel, Scotch poet: b. Redbraes Castle, 25 Dec. 1665; d. 6 Dec. 1746; daughter of the first Earl of Marchmont; married George Baillie in 1692; published a large number of songs in Ramsay's 'Miscellany,' and other collections; the best known is 'Werena My Heart Licht, Isvad Dee.'

Bail'lie, Harry, the proprietor of the Tabard Inn, who acts as chairman of the meeting of the pilgrims in Chaucer's 'Canterbury Tales.'

Bail'lie, Joanna, Scotch author: b. Bothwell, near Glasgow, 11 Sept. 1762; d. 23 Feb. 1851. She removed in early life to London, where in 1798 she published the first volume of her well-known 'Plays on the Passions,' in which she attempted to delineate the stronger passions by making each passion the subject of a tragedy and a comedy. These plays were not well adapted for the stage, but gave Miss Baillie a very extended reputation. Her first volume was followed by a second in 1802, a third (of miscellaneous plays) in 1804, and a fourth in 1812. Other plays appeared in 1836, and a complete edition of her whole dramatic works in 1850. The only plays performed on the stage were a tragedy entitled the 'Family Legend,' which was brought out at the Edinburgh Theatre in 1810 under the patronage of Sir Walter Scott, and had a run of 14 nights, and one of the plays on the passions entitled 'De Montfort,' which was brought out by John Kemble, and played for 11 nights, though an attempt to revive it at a later period failed. Miss Baillie also wrote songs and miscellaneous poems. All her productions are full of genius. The language is simple and forcible, the female portraits are particularly beautiful, and great knowledge of the human heart is displayed in the delineations of character. She was an intimate friend of Sir Walter Scott, who greatly admired her writings, and her home was frequented by many of the prominent authors of the day.

Bail'lie, Matthew, Scotch physician and anatomist: b. Lanarkshire, Scotland, 27 Oct. 1761; d. 23 Sept. 1823; brother of Joanna Baillie; educated at the University of Glasgow and Oxford. While at Oxford he began his medical and anatomical studies under his maternal uncles, the celebrated William and John Hunter, then lecturers in London. In 1787 he was elected one of the physicians of St. George's Hospital, and held that office for 13 years. In 1789 he took the degree of M.D., and was admitted a fellow of the College of Physicians. He very soon stood at the head of his profession, and in 1810 was made physician to the king by George III. He published 'The Morbid Anatomy of Some of the Most Important Parts of the Human Body'; also wrote 11 essays in the "Transactions of the Society for the Promotion of Medical and Chirurgical Knowledge," and 7 papers in the Medical Transactions, published by the London College of Physicians.

Bail'lie, Robert, Scotch Presbyterian clergyman: b. Glasgow, 1599; d. 1622; educated at the University of Glasgow. In 1638 he sat in that famous general assembly which met in Glasgow to protest against the thrusting of Episcopacy on an unwilling people. In 1649 he was chosen by the Church to proceed to Holland, and to invite Charles II. to accept the covenant and crown of Scotland. He performed his mission skilfully; and, after the Restoration, through Lauderdale's influence, he was made principal of Glasgow University.

Bail'lie, Robert, of Jerviswood, Scotch patriot of the reign of Charles II.: d. 24 Dec. 1684. He first came into notice in 1676 through his rescue of a brother-in-law, the Rev. Mr. Kirkton, from the clutches of Archbishop Sharp's principal informer. In 1683 he took a prominent part in a scheme of emigration to South Carolina, as he saw no other refuge from the degrading tyranny of the government. About the same time he corresponded with Monmouth's supporters in London, Russell and Sidney, and subsequently repaired there to concert measures for securing ade-

quate reforms. On the discovery of the Rye-house plot, he was arrested and sent to Scotland. Accused of conspiring against the king's life, and of hostility to monarchical government, he was tried at Edinburgh and condemned to death upon evidence at once insignificant and illegal. The sentence was carried into execution on the very day that it was passed.

Bail'lie of Jerviswood. See BAILLIE, ROBERT.

Baillot, bạ-yō', **Pierre Marie François de Sales,** French violinist: b. Passy, 1771; d. 15 Sept. 1842. He was a professor in the conservatory; traveled in Russia, Belgium, Holland, and England, and was considered without a rival. His style was severely classical, as distinguished from that introduced by Paganini.

Baillou, bä-yō', **Guillaume de,** French physician: b. 1538; d. 1616; became physician to the Dauphin in 1601; was author of several works, including 'Adversaria Medicinalia,' and is considered the first exponent of the nature of croup.

Bailly, bạ-yẹ', **Antoine Nicolas,** French architect: b. 6 June 1810; d. 1 Jan. 1892; was appointed to an office under the city government of Paris in 1834; in 1844 was made architect to the French government, and received the cross of the Legion of Honor in 1853. The Molière Fountain and the Tribunal of Commerce in Paris, and the reconstruction of the Cathedral of Digne, are his work.

Bailly, bạ-yẹ', **Jean Sylvain,** French astronomer, statesman, and historian: b. Paris, 15 Sept. 1736; d. 12 Nov. 1793. Leaving the art of painting, to which he was educated, he pursuch poetry and belles-lettres, until his acquaintance with La Caille, when he turned his attention to astronomy, and calculated the orbit of the comet of 1759. In 1763 he was admitted to the Academy of Sciences; in 1766 he published his treatise on Jupiter's satelites, which also contains a history of that section of astronomy. In 1771 he published a valuable and interesting treatise on the light of the satellites. Later he wrote also a history of astronomy. In 1784 he was chosen secretary of the academy, also admitted to the French academy, and the next year admitted to the Academy of Inscriptions; a rare thing for one person to belong to the three academies. He espoused the democratic cause in the Revolution, was elected from Paris, in 1789, first deputy of the *tiersétat,* and was chosen president of the assembly. In July 1789 he was chosen mayor of Paris and discharged his duties during 26 months of a most trying and dangerous period with great firmness and wisdom. Losing his popularity by repressing riots and defending the queen, he gave up public life, and lived in retirement, till seized by the Jacobins and brought to Paris, where he was condemned as a conspirator and executed. Several posthumous works of his have appeared; the most noted are an 'Essay on the Origin of Fables and Ancient Religions,' and his 'Memoirs of an Eye-witness from April to October 1789.'

Bailly, bạ-yẹ', **Joseph A.,** French sculptor: b. Paris, 1825; d. 15 June 1883; removed to Philadelphia, Pa., in 1850; and produced 'Adam and Eve,' 'Eve and Her Two Children,' and the marble monument of Washington in front of the State house (1869).

Bail'ment, in law, is the delivery of a chattel or thing to another to keep, either for the use of the bailor or person delivering, or for that of the bailee or person to whom it is delivered. A bailment always supposes the subject to be delivered only for a limited time, at the expiration of which it must be redelivered to the bailor; and the material inquiries in cases of bailment, relate to the degree of responsibility of the bailee in regard to the safe-keeping and redelivery of the subject of the bailment. This responsibility will depend, in some degree, upon the contract on which the bailment is made. If a thing is delivered to the bailee to keep without any advantage or use to himself, or any compensation, but merely for the benefit of the bailor, he is answerable only for gross negligence; but if the bailment is for the mutual benefit of both parties, the thing must be kept with the ordinary and usual care which a prudent man takes of his own goods; but if it be delivered for the benefit of the bailee only, he must exercise strict care in keeping it, and will be answerable for slight negligence. A special agreement is made in many cases of borrowing or hiring, specifying the risks assumed by the borrower or hirer; and in such case his obligations will be determined by his stipulations.

Bail'y, Edward Hodges, English sculptor: b. Bristol, 10 March 1788; d. 22 May 1877. He was brought up with a view to a mercantile career; but ere long gained considerable success as a modeler in wax. He became a pupil of Flaxman in 1807, gained the academy gold medal in 1811 for his 'Hercules Restoring Alcestis to Admetus,' and was elected a member of the Royal Academy in 1821. His principal works are 'Eve at the Fountain'; Eve Listening to the Voice'; Maternal Affection'; 'Girl Preparing for the Bath'; 'The Graces'; etc. The bas-reliefs on the south side of the marble arch, Hyde Park, the statue of Nelson on the Trafalgar Square monument, and many statues of distinguished men, were executed by him. In 1863 he was placed on the honorary retired list of the Royal Academy.

Bail'y, Francis, English astronomer: b. Newbury, in Berkshire, 1774; d. 1844; entered a London house of business, and traveled two years in America; then settled in London as a stockbroker and published several works on the doctrine of life annuities and insurance. On retiring from business with an ample fortune in 1825 he turned his attention particularly to astronomy, and became one of the founders of the Astronomical Society; improved the nautical almanac, and investigated and described the phenomenon called Baily's beads (q.v.). Besides many astronomical papers he wrote a 'Life of Flamsteed.'

Bail'y's Beads, a phenomenon attending eclipses of the sun, the unobscured edge of which appears discontinuous and broken immediately before and after the moment of complete obscuration. It is classed as an effect of irradiation and defraction.

Bain, Alexander, Scottish electrician: b. Watten, Caithness, 1810; d. 1877. He went to London and began a series of electrical experi-

ments in 1837; and invented electric fire-alarm and sounding-apparatus, and the automatic chemical telegraph, by which high speed telegraphy was for the first time made possible.

Bain, Alexander, Scotch writer on mental science and education; b. Aberdeen, 1818; d. 2 Jan. 1887; educated at Marischal College and University there. In 1840 he became deputy teacher of the moral philosophy and natural philosophy classes in Marischal College; between 1845 and 1860 he was professor at the Andersonian College, Glasgow, assistant secretary to the Metropolitan Sanitary Committee and the general board of health, and examiner in mental and moral science in the University of London, and for the India civil service examinations. From 1860 till 1880 he occupied the chair of logic and English in the University of Aberdeen (formed by the union of the two universities of Marischal College and of King's College), and in 1881, also in 1884, was elected its lord rector. He is the author of numerous works on mental and moral philosophy, the two most important being 'The Senses and the Intellect' (1855), and 'The Emotions and the Will' (1859). These contain a comprehensive examination of mental phenomena from the standpoint of the experiential school, and have run through several editions. Among his other works are 'The Study of Character' (1861); 'Mental and Moral Science' (1868); 'John Stuart Mill: a Criticism, with Personal Recollections' (1882); 'Logic, Deductive and Inductive' (1870); 'Higher English Grammar' (1863); 'Manual of English Composition and Rhetoric' (1866); 'Education as a Science' (1879).

Bain'bridge, Edmond, English military officer: b. 1841. He was educated at the Royal Military Academy, joined the army in 1860, and became colonel in 1893. Since 1876 he has been connected with the ordnance branch of the military service, serving also as instructor in the School of Gunnery; and, becoming, in 1899, director-general of the English ordnance factories.

Bain'bridge, John, English astronomer and mathematician: b. Ashby-de-la-Zouch, in Leicestershire, 1582; d. 1643. He studied at Cambridge; set up a grammar-school in his native place, and at the same time practised physic, devoting his leisure to the science of mathematics. His 'Description of the Comet of 1618' was the means of introducing him to Sir Henry Savile, who had founded an astronomical lecture at Oxford, and who in 1619 appointed Dr. Bainbridge to the professorship. He died while engaged in publishing corrected editions of the works of the ancient astronomers, an undertaking which was one of the duties enjoined on him as Savilian professor. His other published works are 'Procli Sphæra et Ptolemæi de Hypothesibus Planetarum,' together with 'Ptolemæi Canon Regnorum' (1620); and 'Canicularia: A Treatise on the Dog Star' (1648).

Bain'bridge, William, American naval officer: b. Princeton, N. J., 7 May 1774; d. 28 July 1833. He entered the merchant service and became captain within four years. In 1798, when the United States navy was organized, he was made lieutenant and given command of the schooner Retaliation. He was captured by the French and kept a prisoner for several months, and on his return to the United States was placed in command of the Norfolk and subsequently appointed to the command of the frigate George Washington, which was ordered to take tribute to Algiers. The dey of Algiers demanded that Bainbridge convey an Algerian ambassador and valuable presents to Constantinople, and Bainbridge was forced to comply to avoid war and the destruction of the unprotected trade in the Mediterranean. The United States government fully approved the course he had pursued. He was soon employed in the Mediterranean again in command of the frigate Essex, and afterward upon the declaration of war against the United States by Tripoli, was appointed to the frigate Philadelphia, one of the vessels of the squadron sent against that power, under the command of Commodore Edward Preble. On 26 Aug. 1803, he captured the Moorish frigate Meshboa, but was himself taken prisoner with his officers and men in October of that year. While pursuing one of the enemy's vessels, the Philadelphia ran aground; every possible effort was made to float her, but she was soon surrounded by gunboats from Tripoli, about three miles distant, and Capt. Bainbridge was compelled to surrender, having first taken such measures as it was thought would ensure the final loss of the ship. He remained with his associate prisoners in Tripoli until the conclusion of peace, which took place 3 June 1805. On his return a court of inquiry for the loss of the Philadelphia gave him honorable acquittal. His next service afloat was in the War of 1812, when he was appointed, with the rank of commodore, to the command of a squadron, consisting of the Constitution (his flagship), Essex, and Hornet, and sailed from Boston 25 Oct. for a cruise. On 26 Dec. off San Salvador, while separated from the rest of his squadron, it was his good fortune to fall in with and capture H. B. M. frigate Java. In 1815 he was appointed to the command of a squadron of 20 sail, intended to act against Algiers, then at war with us, but peace was concluded before it reached the Mediterranean. In 1819 he again commanded in the Mediterranean, and returned from this, his last service afloat, in 1821. From this time until his death he was almost constantly employed in important shore service, commanding at different times the navy yards at Boston and Philadelphia, and holding the position of president of the board of navy commissioners. As an officer he had few superiors. Though ardent in his temperament, he was cool in danger, and always had the confidence of those under his command. His system of discipline, though rigid, was always consistent and just, and he was remarkable for paying the greatest attention to the formation of his young officers.

Bainbridge, Ga., a town and county-seat of Decatur County, situated on the Flint River, 236 miles west of Savannah. It is in a cotton and tobacco region, and has various manufactures: turpentine distilleries, lumber mills, etc. It is the seat of the Georgia Southern Military College. Pop. (1904) 5,000.

Baines, Thomas, English artist and explorer: b. Norfolk, 1822; d. 8 May 1875. In

1842 he went to Cape Colony, whence he accompanied the British army in the Kaffir war as artist. He afterward went with Gregory's party to explore northwest Australia; with Livingston to the Zambesi; with Chapman's expedition to the Victoria Falls; and finally headed an expedition to the gold fields of Tati. Everywhere he made large numbers of sketches. A handsome folio of colored lithographs from his drawings at Victoria Falls was published in 1865. His last journey among the Kaffirs was very carefully mapped out and sketched. His writings are 'Explorations in Southwestern Africa' (1864); 'The Gold Regions of Southeastern Africa' (1877).

Baini, bạ-ē'nẹ, **Giuseppe,** Italian musician: b. Rome, 1775; d. 1844. He was director of the Pope's choir from 1814 till his death. The severe gravity and profound science of his compositions contrasted strongly with the careless style and shallow dilettanteism of most of his compeers; but it was by his historical researches that Baini secured for himself a prominent place in musical literature. His principal work is his 'Life of Palestrina' (1828).

Bairaktar, bī'rak-tär' (more correctly, BAIRAK-DAR), signifying "standard-bearer," the title of the Grand Vizier Mustapha: b. 1755, d. 15 Nov. 1808. When he was pasha of Rustchuk in 1806, he fought with some success against the Russians, and after the revolt of the Janissaries in 1807, by which Selim III. was deposed from the throne in favor of Mustapha IV., he marched his troops to Constantinople, deposed Mustapha IV., and proclaimed the brother of this prince, Mahmoud II., sultan on 28 July 1808. Bairaktar was now appointed grand vizier, and endeavored to carry out Selim's reforms, and to strengthen the regular army. His chief object was the annihilation of the Janissaries; but they rebelled, and, with the support of the fleet, attacked the seraglio 15 Nov. 1808, and demanded the restoration of Mustapha IV. Bairaktar defended himself bravely; but when he saw that flames threatened to destroy the palace, he strangled Mustapha, threw his head to the besiegers, and killed himself.

Bairam, bī-räm' or **Beiram,** bī'ram, a Mohammedan feast, immediately following the Ramadan or Lent (a month of fasting), and last three days. This feast begins, like the Ramadan, as soon as the new moon is announced by the persons appointed for that purpose, and during the course of 33 years makes a complete circuit of all the months and seasons, since the Turks reckon by lunar years. It is the custom at this feast for inferiors to make presents to their superiors, a custom formerly extended even to the Europeans. Seventy days after this first great Bairam begins a second — the lesser Bairam. They are the only two feasts whose celebration is prescribed by the Mohammedan religion.

Baird, Absalom, American military officer: b. Washington, Pa., 20 Aug. 1824; d. near Relay, Md., 14 June 1905. He was graduated from the United States Military Academy and assigned to the artillery in 1849. He was commissioned brigadier-general of volunteers, 28 April 1862, and brevetted major-general, 1 Sept. 1862, for his conduct in the Atlanta campaign. On 13 March 1865, he was brevetted major-general, United States army, for meritorious services in the field during the war. He was continually in the field from the Manassas campaign, in 1861, till after the surrender of Gen. Johnston's army in 1865. He was staff inspector-general from 1885 to 1888, when he was retired.

Baird, Andrew Wilson, English military engineer: b. Aberdeen, Scotland, 26 April 1842. He became a colonel in the Royal Engineers Corps in 1893; was special assistant engineer of the harbor defenses of Bombay, in 1864; assistant field engineer of the Abyssinian expedition in 1868, and, for nearly 20 years thereafter, employed on the great trigonometrical survey of India. His services were rewarded with numerous official commendations, medals, and decorations; and he has published a number of important works on his labors in India.

Baird, Charles Washington, American historian and religious writer, son of Robert Baird: b. Princeton, N. J., 28 Aug. 1828; d. 10 Feb. 1887. He was a graduate of Union Theological Seminary, and pastor in Brooklyn in 1859, and in Rye, N. Y., 1861. Besides works on the Presbyterian liturgies (which he was the first to collect and investigate) and local histories, he wrote 'History of the Huguenot Emigration to America' (2 vols. 1885), a work especially interesting to the genealogist.

Baird, Sir David, British general: b. Newbyth, Scotland, 6 Dec. 1757; d. 18 Aug. 1829. He entered the English army in 1772, and going to India distinguished himself at a disastrous engagement at Perambocum, 10 Sept. 1780, in which the small British force engaged was nearly cut to pieces after surrendering. His life was spared, but he was kept prisoner for four years. He attained the rank of major in 1787, and in October 1789, obtained leave of absence and returned to Britain. In 1791 he joined the army under the Marquis Cornwallis, and as commander of a brigade of Sepoys he was present at the siege of Seringapatam, in 1791 and 1792; and likewise at the storming of Tippoo Saib's lines in the Island of Seringapatam. In 1793 he commanded a brigade of Europeans, and was present at the siege of Pondicherry. On 9 May 1799, he commanded the storming party at the assault of Seringapatam; when, in requital of his brilliant services, he was presented by the army, through the commander-in-chief, with the state sword of Tippoo Saib. In 1800 he had a command in Egypt, and with the increased rank of lieutenant-general commanded an expedition which sailed in October 1805, for the Cape of Good Hope, where he defeated the Dutch army and received the surrender of the colony. After a short period of service in Ireland Sir David sailed in command of an armament of 10,000 men for Corunna to assist Sir John Moore. Moore was killed in the battle of Corunna and Sir David succeeded to the chief command; he received for the fourth time the thanks of Parliament, and was created a baronet. In 1814 he was promoted to the rank of general, and in 1819 became governor of Kinsale, next year commander of the forces in Ireland, and in 1827 of Fort George in Scotland. See Hook, 'Life of Sir David Baird' (1832).

Baird, Henry Martyn, American author: b. Philadelphia, Pa., 17 Jan. 1832; d. Yonkers, N. Y., 11 Nov. 1906. He was graduated from New York University in 1850, and later took a course in theology at Union and Princeton. In 1859 he was appointed professor of the Greek languages and literature in the New York University. He wrote: 'History of the Rise of the Huguenots' (1879); 'The Huguenots and Henry of Navarre' (1886); and 'The Huguenots and the Revocation of the Edict of Nantes' (1895); 'Theodore Beza, the Counsellor of the French Reformation' (1899).

Baird, Julian William, American chemist: b. Battle Creek, Mich., 14 Feb. 1859. He was graduated from the University of Michigan in 1882; was instructor in chemistry and in charge of the qualitative analysis and assaying in Lehigh University, 1883–6; and became professor of analytical and organic chemistry in the Massachusetts College of Pharmacy, Boston, in 1886, and its dean, in 1887.

Baird, Robert, American historian. b. Fayette County, Pa., 6 Oct. 1798; d. Yonkers, N. Y., 15 March 1863. He was graduated from Jefferson College; and published 'History of the Waldenses, Albigenses, and Vaudois,' 'History of the Temperance Societies' (1836); 'Religion in America' (1844); 'Protestantism in Italy' (1845); etc. He was corresponding secretary of the American and Foreign Christian Union (1849–55, 1861–3).

Baird, Spencer Fullerton, distinguished American naturalist: b. Reading, Pa., 3 Feb. 1823; d. 19 Aug. 1887. He became professor of natural sciences at Dickinson College, Carlisle, Pa., 1845; assistant secretary Smithsonian Institution, 1850; United States commissioner of fish and fisheries, 1871; secretary of the Smithsonian Institution, 1878; and founder of the National Museum. Among his more important works are a 'Catalogue of North American Reptiles' (1853); 'Birds of North America' (with Cassin and Lawrence, 1860); 'Mammals of North America' (1858); 'History of North American Birds'' (with Brewer and Ridgeway, 1874–84), etc. His work had a beneficent influence on natural history in the United States.

Baireuth, bī-roit, or **Bayreuth,** a city of Bavaria, on the Red Main, 41 miles northeast of Nuremberg. The principal edifices are the old palace now occupied by public offices, the new palace, with garden and park open to the public; the opera house, a gymnasium, and the national theatre, constructed after the design of the composer Wagner, and opened in 1876 with a grand performance of his 'Ring of the Nibelungen.' Baireuth fell to the burgrave of Nuremberg in 1248, and after many vicissitudes was ceded to Bavaria in 1810. The chief industries are cotton-spinning, and weaving, sugar-refining, brewing, etc. Pop. (1900) 29,000.

Baiter, bī'tėr, **Johann Georg,** Swiss philologist: b. Zurich, 31 May 1801; d. 10 Oct. 1877. He was professor in the University of Zurich, and from 1849 to 1865, director in the gymnasium there. He published, alone and with others, various editions of the classics, 'Panegyrics of Socrates,' 'Ciceronis Scholistæ,' 'The Attic Oratoris' (1839–50), etc.

Ba'ius, or **De Bay Michael:** b. 1513, at Melin, near Ath, in Hainaut; educated at Louvain, in 1551; made professor of Scripture at this university in 1563, sent by the king of Spain to the Council of Trent, was one of the greatest theologians of the Roman Catholic Church in the 16th century. He founded systematic theology directly upon the Bible and the Christian fathers, leaving the scholastic method. He studied specially the writings of St. Augustine and had his own interpretations of that father. The doctrines that the human will, when left to itself, could only sin; that even the mother of Jesus was not free from hereditary and actual sin; that every action which did not proceed from pure love of God was sinful; and that no penance was effectual for the justification of the sinner, but everything was to be attributed solely to the grace of God, through Christ, caused the superior of the Franciscan Order in Belgium to submit 18 of his propositions to the Sorbonne in Paris. The Sorbonne faculty condemned 3 of the propositions as false and 13 as contrary to Catholic teaching. Baius disavowed the condemned sentences, claiming that some of them had not been taught by him and that others had been presented incorrectly. After his return from Trent, he published theses which contained doctrines that were rejected by the Spanish and Italian universities to which they had been submitted. Finally 76 sentences taken from his works were condemned by Pius V. in 1567 and some dispute arising about the meaning of this bull, it was confirmed by Gregory XIII. and entrusted to the Jesuit Cardinal Toletus to deliver to Baius. Baius submitted; yet the opposition still continued, as did also his defense of some of his interpretations of Augustine in his lectures; and as the theological faculty at Louvain was entirely in his favor, he not only remained in the quiet possession of his dignities, but was also appointed dean of St. Peter's in 1575, and in 1578 chancellor of the university. He died in 1589, and left the reputation of great learning, pure morals, and a rare modesty. His interpretations of Augustine, which were called *Baianism*, were adopted by the Jansenists and were defended by them against their Jesuit opponents. His doctrine of pure undivided love to God has also been adopted by the Quietists. His writings, mostly polemical, were published at Cologne (4to 1696).

Bibliography.— Duchesne, 'Historie du Bayanism'; Linsenmann, 'Bayus und die Grundlegung des Jansenismus.'

Baja, bŏ'yŏ, a Hungarian market town situated on the Danube, 90 miles south of Budapest. It has important manufactures of alcohol and shoes and is celebrated for its annual swine fair, and its trade in grain and wine. Pop. (1890) 19,500.

Bajada Del Parana, bạ-hä'dạ dĕl pä'rạ-nä'. See PARANA.

Baj'azet' I., or **Bayazid I.,** a Turkish sultan: b. 1347; d. 1403. In 1389 he succeeded his father, Murad of Amurath, who fell in the battle of Kossova against the Servians, and caused his brother Jacob, his rival for the throne, to be strangled. He made great and rapid conquests, in three years conquering Bulgaria, part

of Servia, Macedonia, Thessaly, and subjecting the states of Asia Minor. In order to save Constantinople, King Sigismund of Hungary (afterward emperor of Germany) assembled a great army, but Bajazet met them at Nicopolis and obtained a decisive victory over the allied Hungarians, Poles, and French in 1396. He would probably have now overturned the whole Greek empire if Timur had not overrun Asia Minor in 1400 and defeated him in a battle at Angora. He himself fell into the power of the conqueror and died in Timur's camp, in Caramania. His successor was Soliman I. BAJAZET II., b. 1447; d. 1512, succeeded his father, Mohammed II., Sultan of the Turks, in 1481. He increased the Turkish empire by conquests on the northwest, and in the east, took Lepanto, Modon, and Durazzo, in a war against the Venetians, and ravaged the coasts of the Christian states on the Mediterranean, to revenge the expulsion of the Moors from Spain. At home he had to contend against his rebellious son Selim, to whom he at last resigned the empire. It has been supposed that he was put to death by the order of his son. He was a man of great talents, and did much for the improvement of his empire and the promotion of the sciences.

Baj'azet', the title of a tragedy by Racine, in which the chief character is Bajazet, the brother of the Sultan Amurath, whose choice between the throne and the woman he loves forms the theme of the drama.

Baj'azet', Mosque of, a mosque at Constantinople, built in 1505 by Bajazet II. It is one of the finest specimens of Mohammedan architecture, and displays excellent proportions and great richness of detail in decoration. There are four Persian doorways and an octagonal foundation in the centre of the court.

Baj'imonts' Roll. See BAGIMONTS' ROLL.

Bajocco, bạyŏk'kō, or **Baiocco,** a papal state copper coin, whose value is about one cent. A Neapolitan coin, value about 83 cents, was also called Bajocco in Sicily.

Baj'ree. See GUINEA CORN.

Bajura, bạ-joo'rạ, the banner of Mohammed.

Bajza, boi'zŏ, **Joseph,** Hungarian poet and critic: b. 1804; d. 1858. He devoted himself to history, and edited a 'Historical Library' (1843–5) and the 'New Plutarch' (1845–7). He was also editor of two critical journals, which exerted a strong influence on Hungarian literature. From 1831 he was a member of the Hungarian Academy, and from 1836 of the Kisfaludy Society. He ranks among the best lyric poets of Hungary. His 'Poems' appeared in 1835, and his 'Collected Works' in 1861.

Bakacs, bō'kŏch, **Thomas,** Hungarian statesman, son of a peasant: b. about the middle of the 15th century; d. 1521. He held several bishoprics in succession, became chancellor of the kingdom, and finally archbishop and cardinal. He preached a crusade against the Turks; but his army of peasants and vagabonds turned their arms against the nobility, and a fierce civil war ensued.

Bakairi, bạ-kä-ī-rẹ, or **Baccahiry,** a Caribbean tribe of central Brazil, remarkable for their light complexion. The men have assembly houses, where they spend most of their time, which women are forbidden to enter.

Bakarganj, bäk'ar-gạnj, an English district in India, under the lieutenant-governor of Bengal. It contains 3,649 square miles, is fertile, and is watered by the lower streams of the Ganges and the Brahmaputra. In the south of the district are the forest tracts of the Sunderbunds. Barisal, the headquarters, on the west bank of Barisal River, is the only town with more than 5,000 inhabitants. Bakarganj, the former capital, situated near the junction of the Krishnakati and Khairabad rivers, is now in ruins. Pop. 2,153,695.

Bake, bä'kĕ, **Jan,** Dutch philologist: b. Leyden, 1 Sept. 1787; d. 28 March 1864. In 1817 he became professor of Greek and Roman literature at the University of Leyden, holding the position till 1857. Here he edited and published valuable editions of Posidonius, and of the astronomer Cleomedes, and assisted in the large and original work entitled 'Bibliotheca Critica Nova.' He published a series of philological articles, edited some of the works of Cicero, and wrote an excellent essay upon the Greek tragedians.

Baker, David Augustine, Benedictine ascetical writer: b. 1575; d. 1641. The most original and ablest spiritual writer among English Catholics during the first half of the 17th century. Having finished his studies at Oxford, he devoted himself to law at Clifford's Inn, and later at Inner Temple. In his 40th year he became a convert to the Catholic faith, and a few years later was ordained priest and was subsequently received into the Benedictine Order. Dugdale and Dodsworth are indebted to his historical labors for much of the data found in their monumental works. It was Father Baker who discovered that the old English Benedictine monastery of Saint Peter at Westminster was legally continued in the person of an old priest, Dom Sigebert Buckley. By this sole survivor David Baker was professed into the monastery of Westminster, and thus became the connecting link between the old and the new congregation in England. It was as spiritual director at Douai and Cambrai that he composed his admirable treatises on the spiritual life. Consult: Wood, 'Athenæ Oxoniensis'; Taunton, 'English Black Monks of Saint Benedict.'

Baker, SIR **Benjamin,** English engineer: b. near Bath, 1840; d. Pangbourne, Berkshire, 19 May 1907. In 1877 he superintended the removal of Cleopatra's Needle from Egypt to London and was consulting engineer on the Assouan dam. In conjunction with Sir John Fowler he planned the bridge over the Firth of Forth. He wrote 'Long Span Iron Bridges'; 'Suspension Versus Cantilever Bridges'; 'The Strength of Beams'; and 'Transportation and Re-erection of Cleopatra's Needle.'

Bak'er, Benjamin W., American educator: b. Coles County, Ill., 25 Nov. 1841. He served in the Union army through the Civil War; became a Methodist Episcopal clergyman in 1874; and was financial secretary of the Illinois Wesleyan University in 1883–93; president of Chaddock College in 1893–8; and subsequently became president of the Missouri Wesleyan College in Cameron.

Bak'er, Charles Whiting, American civil engineer: b. Johnson, Vt., 17 Jan. 1865. He was graduated at the engineering department of the University of Vermont and became managing editor of 'Engineering News' in 1900. He is the author of 'Monopolies and the People'; etc.

Bak'er, Edward Dickinson, American soldier and politician: b. London, England, 24 Feb. 1811; d. 21 Oct. 1861. He came to the United States in youth, was elected to the Illinois legislature in 1837, became a State senator in 1840, and was sent to Congress in 1844. He served under Gen. Scott in the war with Mexico, and was elected United States senator from Oregon in 1860. He entered the Federal army at the outbreak of the Civil War, and was killed at the battle of Ball's Bluff.

Bak'er, Frank, American zoologist: b. Pulaski, N. Y., 1841. He was professor of anatomy in the University of Georgetown; and in 1900 was superintendent of the National Zoological park, in Washington, D. C. He is a Fellow of the American Association for the Advancement of Science, and a member of the Academy of Science, and the Anthropological and the Biological Societies, all in Washington.

Bak'er, George Augustus, American painter: b. New York, 1821; d. 2 April 1880. He studied at the National Academy of Design in New York, and in Europe, and was elected to the National Academy in 1851. He was especially celebrated as a portrait painter, and reproduced flesh-tints very accurately. His principal works, aside from his portraits, are 'Love at First Sight'; 'Wild Flowers'; 'Faith'; and 'The May Queen.'

Bak'er, George Augustus, American writer of verse and stories: b. New York, August 1849. He wrote 'Point Lace and Diamonds,' light society verse (New York 1875) 'Bad Habits of Good Society' (1876); 'Mrs. Hephæstus and Other Stories' (1887); and several comedies.

Bak'er, Harriette Newell (Woods) (pseudonyms Madeline Leslie and Aunt Hatty), American writer of juvenile stories: b. 1815; d. 1893. A very voluminous writer, several of her works have been translated into French and German. She has written 'Tim, the Scissors-Grinder' (1861, sequel in 1862), her most popular work; 'Up the Ladder' (1862); 'The Two Homes' (1862); 'The Organ-Grinder' (1863); 'White and Black Lies' (1864); 'Worth and Wealth' (1864); 'Tim's Sister' (1864); 'Wheel of Fortune' (1865); 'Courtesies of Wedded Life' (1869) 'Paul Barton' (1869); 'Fashion and Folly' (1869); 'Lost but Found' (1869); 'Ingleside' (1886); 'This and That' (1887); etc. She was a daughter of Leonard Woods, the theologian, and wife of Rev. Abijah R. Baker.

Bak'er, Henry, English naturalist: b. 8 May 1698; d. 25 Nov. 1774. In 1740 he was chosen a Fellow of the Royal and Antiquarian societies, and in 1744 obtained the Copley medal for his microscopical discoveries on crystallization. He contributed many papers to the 'Philosophical Transactions'; was an active member of the Society for the Encouragement of Arts. He wrote 'The Microscope Made Easy'; 'Employment for the Microscope'; many scientific papers, and several poetical works.

Bak'er, Ira Osborn, American educator: b. Linton, Ind., 23 Sept. 1853. He became professor of civil engineering in the University of Illinois in 1880, and has published 'Engineers' Surveying Instruments'; 'Treatise on Masonry Construction'; and 'Brick Pavements.'

Bak'er, James Hutchins, American educator: b. Harmony, Me., 13 Oct. 1848. He was principal of the Denver High School in 1875–91; and in the last year became president of the National Council of Education, and also of the University of Colorado. He has published numerous lectures and monographs, and a work on 'Elementary Psychology.'

Bak'er, John Gilbert, English botanist: b. Guisborough, Yorkshire, 13 Jan. 1834, and was appointed assistant curator at the herbarium at Kew in 1866. He was for many years lecturer on botany to the London Hospital, and in 1882 received a like appointment from the Apothecaries' Company; he is also a member of the Royal and Linnæan Societies. His voluminous writings include works on the flora of districts so diverse as the north of England, Madagascar, and Brazil; and popular monographs and scientific catalogues of high value.

Bak'er, Lafayette C., American detective: b. Stafford, N. Y., 13 Oct. 1826; d. 2 July 1868. He was chief of the Secret Service Bureau during the Civil War; and reached the military rank of brigadier-general. He superintended the pursuit of Wilkes Booth, President Lincoln's assassin; and published a 'History of the United States Secret Service' (1868).

Bak'er, Marcus, American cartographer: b. Kalamazoo, Mich., 23 Sept. 1849. He became connected with the United States Coast and Geodetic Survey in 1873, and with the United States Geological Survey in 1886; and in 1900 was secretary of the United States Board on Geographic Names. He was cartographer to the Venezuela boundary commission, and after spending many years surveying and exploring in Alaska, and along the Pacific coast, prepared, with William H. Dall, the 'Alaska Coast Pilot.'

Bak'er, Moses Nelson, American civil engineer: b. Enosburg, Vt., 26 Jan. 1864. He was editor for several years of the 'Manual of American Waterworks'; and in 1900 was associate editor of 'Engineering News.' He has published 'Sewage Purification in America'; 'Sewerage and Sewage Purification'; etc.

Bak'er, Osmon Cleander, American clergyman: b. Marlow, N. H., 30 July 1812; d. 20 Dec. 1871. He was educated at Wesleyan University; spent several years in teaching, and was one of the founders of the system of Methodist Episcopal theological schools. He was professor in the Biblical Institute in Concord, N. H., 1847–52, and in the last named year was elected a bishop. His work, 'Guide-Book in the Administration of Discipline of the Methodist Episcopal Church' (1855), is a standard authority.

Bak'er, Sir Richard, English historian: b. Kent, 1568; d. 1645. He was educated at Oxford, and knighted in 1603 by James I.; in 1620 he filled the office of high sheriff of Oxfordshire, having estates in that county. Shortly afterward he was thrown into Fleet Prison be-

cause of having given security for a debt contracted by his wife's family, which he was unable to pay. During his imprisonment he wrote 'Chronicle of the Kings of England,' first published in 1641, and afterward continued by Edward Phillips, the nephew of Milton, and others, a work popular at the time, but not of permanent value. He died in prison.

Bak'er, Sir Samuel White, English explorer: b. London, 8 June 1821; d. 30 Dec. 1893. He was trained as an engineer, and at the age of 24 went to Ceylon, where he founded an agricultural settlement at Nuwara Eliya in 1847. In the early part of 1861, accompanied by his wife, he set out for Africa on a journey of exploration. When he had ascended the Nile as far as Gondokoro he met Speke and Grant returning after their discovery of the Victoria Nyanza Lake, and learned from them that another large lake in the district had been spoken of by the natives. This lake he determined to discover, and after many adventures he and his wife beheld the Albert Nyanza, on 14 March 1864. On his return home he was received with great honor, and was knighted. In 1869 he returned to Africa as head of an expedition sent by the Khedive of Egypt to suppress the slave trade, and to annex and open up to trade a large part of the newly explored country, being raised to the dignity of pasha. Returning in 1873, he was succeeded by the celebrated Gordon. In 1879 he explored the island of Cyprus, and subsequently traveled in Asia and America. His writings include: 'The Rifle and the Hound in Ceylon' (1854); 'Eight Years' Wanderings in Ceylon' (1855); 'The Albert Nyanza' (1866); 'The Nile Tributaries of Abyssinia' (1867); 'Ismailia, a Narrative of the Expedition to Central Africa' (1874); 'Cyprus as I saw It in 1879'; 'Wild Beasts and Their Ways' (1890); also, 'Cast up by the Sea,' a story published in 1869.

Bak'er, Thomas, English antiquary: b. 1656; d. 1740. His 'Reflections on Learning' (1709–10) went through seven editions. He left in manuscript 42 folio volumes of an 'Athenæ Cantabrigiensis,' from which a 'History of St. John's College' was edited by Prof. Mayor in 1869.

Bak'er, Valentine, English military officer, also known as Baker Pasha: b. 1825; d. Tel-el-Kebir, 1887. He was a brother of Sir Samuel White Baker. For his services in the Crimean war he was made colonel of the 10th Hussars. In the Russo-Turkish war of 1877 he was in the Turkish service, and subsequently served in Egypt. He wrote 'Clouds in the East' (1876); and 'The War in Bulgaria' (1879).

Bak'er, William Bliss, American artist: b. New York, 1859; d. Ballston, N. Y., 1889. He studied at the National Academy, and is especially noted for his landscapes. Among his works are 'In the Old Pasture'; 'October Morning'; and 'Under the Apple-Tree.'

Bak'er, Sir William Erskine, Scottish military and civil engineer: b. Leith, Scotland, 1808; d. 16 Dec. 1881. He served in the first Sikh war, and afterward held many offices in the public works department of India. His engineering work in Scinde was very valuable, as the scheme of irrigation which he carried through has imparted fertility to a barren territory. He became a member of the council of India in 1861; major-general in 1865; a K. C. B. in 1870; and retired from public life in 1875.

Bak'er, William Henry, American gynæcologist: b. Medford, Mass., 11 March 1845. He was graduated at the Harvard Medical School, and became professor of gynæcology there. His publications include 'The Treatment of Cancer of the Uterus'; 'Diseases of the Urethra and Bladder'; etc.

Bak'er, William Mumford, American novelist and clergyman: b. Washington, D. C., 27 June 1825; d. South Boston, Mass., 20 Aug. 1883. He was graduated at Princeton 1846, and held Presbyterian pastorates in Texas for 15 years, when he returned to the north and accepted a charge in South Boston. As a writer, one of his most important books was 'Inside: A Chronicle of Secession' (1866), secretly written during the war, and giving an illuminating picture of Southern sentiment. Other works are: 'Life and Labors of Rev. D. Baker' (1858); 'The Ten Theopanies' (1883). His novels, several of which appeared serially, include: 'Mose Evans' (1874); 'Carter Quarterman' (1876); 'Colonel Dunwoodie' (1878); 'The Virginians in Texas' (1878); 'His Majesty Myself' (1879); and its sequel, 'The Making of a Man' (1884); 'Blessed Saint Certainty' (1881).

Bak'er, and the Baker's Wife, The, names popularly given to Louis XVI. of France, and Marie Antoinette, because they gave bread to the starving mob at Versailles, 6 Oct. 1789.

Bak'er City, Ore., a city and county-seat of Baker County, situated on the east fork of the Powder River, 360 miles east of Portland, on the Oregon R.R. It is the centre of an extensive farming, gold-mining and stock-raising region, and has a considerable export trade. It is governed by a mayor, biennially elected, and a city council, and operates the waterworks. It was settled in 1860 and incorporated in 1872. Pop. (1900) 6,663.

Bak'er, Mount, an occasionally active volcano in Whatcom County, Wash., belonging to the Cascade Range; elevation, 10,827 feet.

Bak'er University, a co-educational institution in Baldwin, Kan. It was founded in 1858, under the auspices of the Methodist Episcopal Church, and at the end of 1905 had 40 professors and instructors, and 1,000 students. Its library contained 14,000 volumes, and the grounds and buildings were valued at $80,000; graduates, 1,200; productive funds, $50,000; income $40,000.

Bak'er's Antelope, a large antelope (*Hippotragus Bakeri*) of equatorial Africa, discovered by Sir Samuel Baker. It is pale brownish-red with black stripes on the shoulders, and has massive horns.

Bak'er's Dozen, a familiar phrase supposed to have originated in an old practice of bakers who, when a heavy penalty was inflicted for short weight, used to give a surplus number of loaves, called the inbread, to avoid all risk of incurring the fine. Thirteen, therefore, became a baker's dozen, and 13 also is assumed to be the number of witches who sat down together at dinner on the Lord's Day, even as it was the

number who were at that last Passover supper which immediately preceded the betrayal of Christ. Thirteen was also called the "devil's dozen."

Bak'ersfield, Cal., a town and county-seat of Kern County, situated on the Kern River and on the Southern Pacific railroad. It is the centre of an oil region and of a stock-raising and fruit-growing industry; therefore has a good trade and some manufacturing interests as well. Pop. (1900) 4,836.

Bake'well, Robert, English agriculturist: b. 1725; d. 1795. He succeeded his father, in 1760, as occupier of the Dishley farm in Leicestershire, and then began experiments for the improvement of cattle (introducing the celebrated long-horned breed), and also of horses, pigs, and sheep. He also introduced into English agriculture the practice of flooding meadows. He never contributed anything to literature, but Arthur Young, in his annals of agriculture, fully described and praised his plans and improvements.

Bakhmut, bäkh-moot'. See BACHMUT.

Bakhtchissarai, bäk'chẹ-sa-rī', a town of Russia, the capital of the government of Taurida; situated on the Tchoorook, 15 miles southwest of Simferopol. It consists of a single street, built along the banks of the Tchoorook, and lined in Oriental fashion with bazaars and workshops. It contains also several mosques, whose tall minarets rise high above the neighboring houses. Here also is the ancient palace of the khans who ruled over the Tauridian state before the rise of Russian power. The inhabitants are chiefly Mohammedans. Pop. (1900) 13,000.

Bakhtegan, bäkk-tē-gän, a salt lake in Persia, 47 miles east of Shiraz; 74 miles long and from 4 to 13 miles wide. Large quantities of salt are gathered from its basin.

Bakhtiari, bäkh'tē-ä'rē. (1) A range of mountains of Persia extending parallel to the Arva and Laristan ranges. (2) A half-civilized tribe living in the above mountains, estimated to number 232,800.

Baki, bä'kē, the greatest lyric poet of Turkey: died about 1600. His 'Divan' contains almost exclusively odes in praise of the Sultan.

Baking Machinery. See BREAD AND BREAD-MAKING.

Bak'ing Pow'der, a chemical preparation used in the place of yeast to give lightness to bread and other similar articles of diet. Yeast induces a kind of fermentation, accompanied by the generation of bubbles of the gas known to chemists as carbon dioxid; and it is the development of these bubbles within the dough that causes it to swell (or "rise") and become light. When baking powder is used in the place of yeast, the action is similar, except that the gas is generated by direct chemical action, instead of by fermentation. The best baking powders contain bicarbonate of soda or bicarbonate of ammonia as their alkaline constituent, intimately mixed with tartaric or phosphoric acid, or an acid tartrate or phosphate. So long as the powder is kept dry, its acid and alkaline constituents do not combine with each other; but when moistened, combination takes place, and carbon dioxid is generated, just as in the case of yeast. Owing to the cost of tartrates and phosphates, alum is not infrequently used as the acid constituent in the cheaper powders; but health authorities almost universally condemn this substitution.

Bakkebakke, bäk'kẽ-bäk'kẽ, a tribe of African pigmies dwelling in the French Congo territory.

Bakonywald, bŏ'kōn-y'-vält, a mountain range in Hungary, between the Raab and Lake Balaton, separating the great and little Hungarian plains. Average elevation, 2,000 feet. It is covered with forests, on the mast of which large herds of swine are fed. There are fine quarries of marble in the mountains.

Baksheesh, bäk-shēsh', or **Bakshish,** an Eastern word, denoting a present or gratuity. In Egypt and other parts of the Turkish empire the traveler has scarcely set foot on shore before clamors for baksheesh, on the most frivolous pretexts, or in simple beggary, without pretext at all, assail his ears from every quarter. Baksheesh is the first Arabic word with which he becomes acquainted, and he acquires it unwillingly.

Baku, a Russian town in Georgia, on the Caspian Sea. The rocky peninsula upon which it is built and the islands in the bay are composed of Tertiary strata, abounding in fossil shells. Through these strata numerous springs of naphtha and petroleum issue, together with streams of inflammable gas, and eruptions of mud from so-called mud volcanoes. These phenomena give to the region the name of the Field of Fire, and formerly made Baku the sacred city of the Guebres or Fire Worshippers. Naphtha is so abundant as to be an article of commerce. The chief product of the region, however, is petroleum. Over 500 oil wells are operated, producing large quantities of petroleum, much of which is carried by pipes directly to the refineries. Baku has a large trade, exporting besides the oil, grain, salt, etc. It has grown very rapidly in recent years, its prosperity being due to the petroleum industry which is chiefly in the hands of foreign capitalists. See Marvin, 'The Region of Eternal Fire' (1883); Louis, 'The Baku Petroleum District' in the 'Engineering Magazine, No. XV.' (1898). Pop. about 119,000.

Bakunin, ba-koon'yen, **Michel,** Russian anarchist: b. 1814; d. 1 July 1876. He was educated in a military school at St. Petersburg, and served for a time in the artillery of the guards. In 1841–3 he was in Germany, engaged in philosophical study. In 1843, he went to Paris, and entered into relations with the Polish emigration, and shortly afterward to Switzerland, where he participated actively in various socialist and communist associations. The Russian government ordered him to return home. Bakunin refused, and his estate was confiscated. In 1847, during the excitement produced in Paris by the question of parliamentary reform, he made a speech invoking the fusion of Poles and Russians, for the better and easier revolutionizing of Russia, on account of which the Russian government demanded his expulsion from France. For the next two years he was active in the revolutionary movement at Prague, at Berlin, and at Dresden. He was taken prisoner and condemned to death; but the sentence was commuted to life imprisonment

and he was sent to Siberia. In 1860, he escaped to Japan, and from there went by way of the United States to London. Here he joined the work of the revolutionary socialist movement, and in 1869, founded the Social Democratic Alliance, which later joined the International Workingmen's Association. His views were thoroughly anarchistic and when he tried to impose them upon the Association he was expelled by the Hague Congress in 1872. In 1873 Bakunin stopped active work and lived for the rest of his life in Switzerland.

Bala, bä-la, a town of North Wales, at the north end of the Bala lake, county of Merioneth. The town and its neighborhood have long been famous for the manufacture of knitted stockings, and gloves of strong and soft texture. At the south end of the town is a large artificial mound, supposed to be of Roman origin. This mound was anciently occupied by the Welsh as a fort to prevent the incursions of the English.

Bala Beds, a local deposit in North Wales, near Bala, which form a group in the Lower Silurian of Murchison. They consist of a few beds, rarely more than 20 feet in thickness, and chiefly composed of hard crystalline limestone, alternating with softer argillaceous bands, which decompose more freely, and leave the limestone like a cornice molding, affording a characteristic by which, at a considerable distance, the Bala Beds can be distinguished from the rocks of hard, gritty slate above and below. Trilobite and cystidæ are the predominant fossils of the group.

Balaam, a Biblical personage, the son of Beor, and a native of Pethor. The children of Israel had reached, in their journey, the plains of Moab. Balak, the king, terrified at seeing so great a host invading his territory, sent, therefore, to Balaam, a well-known prophet and soothsayer, to come and curse these hosts for him, so that, peradventure, he might then smite them and drive them out of the land. Balaam, warned of God in the night, refused to go with the messengers, and sent them away. Balak sent yet others. He at first also refused them, but in the morning he went, with the divine injunction to speak what the Lord should tell him. The angel of the Lord met him in the way, gave the ass he rode a vision in three several instances, and each time Balaam angrily smote the beast for her involuntary manifestations of terror. After the third beating an interlocution ensued between the ass and the master, when the Lord opened the eyes of Balaam, and, seeing the angel, he conversed with him instead of the ass. As the result of the conversation, Balaam was permitted to go on, and the charge repeated to speak only that which the Lord should tell him. Coming unto Balak, he informed him that he could only speak that which God shall put into his mouth. Balaam refused to curse Israel, but pronounced a blessing upon them, in the three several places to which Balak brought him in the vain hope of securing his purpose. This is the Old Testament history of the transaction, given in Numbers xxii.–xxiv. In Numbers xxxi. 8, 16, and Joshua xiii. 22, Balaam is mentioned as advising Balak to lead the children of Israel into idolatry, which, according to his directions, they did, and hence arose a war with Moab.

Bal'achong, an Oriental condiment, composed of small fishes, or shrimps, pounded up with salt and spices and then dried.

Bal'æna, the genus including the Greenland or right whale, type of the family *Balænidæ,* or whale-bone whales. Hence *baleen* = whalebone.

Bal'æniceps ("whale-head"), a genus of African wading birds belonging to the region of the Upper Nile, intermediate between the herons and storks, and characterized by an enormous bill, broad and swollen, giving the only known species (*B. rex*), also called shoe-bird. It feeds on fishes, water-snakes, carrion, etc., and makes its nest in reeds or grass adjoining water. The bill is yellow, blotched with dark brown, the general color of the plumage dusky gray, the head, neck, and breast slaty, the legs blackish.

Balaguer, bä-lä-gär', **Victor,** Spanish historian: b. Barcelona, 11 Dec. 1824. He became keeper of the archives at Barcelona, professor of history in the university there; and was an active Liberal politician, and, in 1888, chief of the council on the Philippine Islands. He wrote 'The Troubadours of Montserrat' (1850); 'Political and Literary History of the Troubadours' (1878–80); 'Poems' (1874); 'Don Juan de Serravalle' (5th ed. 1875), etc.

Balahissar, bä'-la-hĭs-sär', a village in the southwestern part of the province of Angora, Asia Minor. It is on the site of the ancient Pessinus, famous for its worship of Cybele. Among fragments of marble columns, friezes, etc., rise the ruins of her gorgeous temple, and remains of a theatre in partial preservation, a castle, and a circus.

Balakireff, ba-lä'ke-ryĕf, **Mili Alexeyevich,** Russian composer: b. Nizhni-Novgorod, 1837; he is ranked as the founder of the young Russian school of music. At 18 he is said to have known by heart nearly all of the musical classics. With other musical enthusiasts he strove to impart a flavor of nationalism into music, his especial works in this direction being 'Songs' (1858–60); three overtures on Russian themes; three on Chekh themes (1867); 'Forty National Songs' (1866); 'Islamey,' a fantasy (1869). His most important compositions are 'Tamora,' a fantasy for orchestra and a symphony in C major. His extended works illustrate programme music of the Berlioz Liszt school. See Cui, 'La Musique en Russie' (1880); Pongin, 'Essai Historique sur la Musique en Russie' (1897).

Balaklava, bä-la-klä'va, or **Balaclava,** a small seaport of Russia, in the Crimea, eight miles south-southeast of Sebastopol. It consists for the most part of houses perched upon heights, and it has an old castle, built by the Genoese. The harbor has a very narrow entrance, and, though deep, is not capacious. In 1854 Balaklava became the principal landing-place of the British after the battle of the Alma. The battle of Balaklava fought 25 Oct. 1854, when the Russians in overwhelming force were repulsed by a small body of British troops, is one of the most heroic achievements of modern times, the "charge of the light brigade" being the most glorious incident in the conflict. (Kinglake, 'Invasion of the Crimea'; Paget, 'The Light Cavalry Brigade in the Crimea.')

Balamban, bä-läm'bän, a small town on the west coast of Cebu, on Tanon Strait, Philippines. It was occupied by a garrison of United States infantry after a battle with Filipino insurgents early in January 1900. It has a native population of some thousands, and a public school in which English is taught.

Balan, ba-läṅ. (1) A French poem, an early version of 'Fierabras,' of which there was also an English version, 'The Sowdan of Babylon.' (2) The brother of Balin, in Arthurian legends.

Bal'ance (Latin, *bis,* "twice," and *lanx,* a "dish," or "pan"), an instrument for determining the mass of a body by comparison with a series of other bodies (called "weights") whose masses are known. The term is often applied, though somewhat incorrectly, to the familiar instruments in which the weight of a body is determined by observing the extension that it can produce when acting upon a spring whose extensibility has been previously determined by direct experiments with known weights. The "spring balance" is useful in the ordinary affairs of life, where high precision is not essential; but it is seldom employed in accurate scientific work, since it is liable to errors that cannot be eliminated or allowed for — errors that are small enough to be neglected in commercial transactions, but quite intolerable in refined laboratory work.

The "lever balance" consists essentially of a lever (q.v.) having arms of known lengths. The mass to be determined is suspended at the extremity of one of the arms, and the known masses (or weights) are suspended from the extremity of the other one, their number and size being varied until, after repeated trials, a perfect equilibrium, or "balance," is attained. If the two arms of the lever are equal, the mass of the body under examination is then equal to the sum of the masses of the weights that are balanced against it. In many cases (for example, in the familiar "platform scales") the arms of the lever are intentionally made very unequal, the object to be weighed being suspended from the short arm of the lever, while the weights are suspended from the long arm. To determine the mass of the object it is then necessary to multiply the sum of the masses of the weights by the ratio of the long arm to the short one; but in practical work this calculation does not need to be performed, because the instrument is graduated by the maker so that all necessary allowance for the difference in the arms has been made, and the readings give the corrected mass directly. In many cases the balances (or "scales") used in commerce are constructed so that equilibrium is attained by varying the length of the lever-arm rather than by varying the load at the extremity of that arm; but the fundamental principles involved are the same in all cases, and are set forth in detail in the article Lever (q.v.).

In the "precision balance" of the chemist and physicist, the lever (called the "beam") consists of a light but strong and rigid framework, usually made of brass or bronze, and having a shape somewhat like that shown in Fig. 1. It is supported by means of a wedge-shaped piece of steel, technically known as a "knife-edge," which is hardened and ground to a sharp and accurately straight edge, and which rests, when the balance is in use, upon a flat slab of agate, or other hard, smooth substance, in such a manner as to leave the beam free to tip one way or the other, with practically no frictional

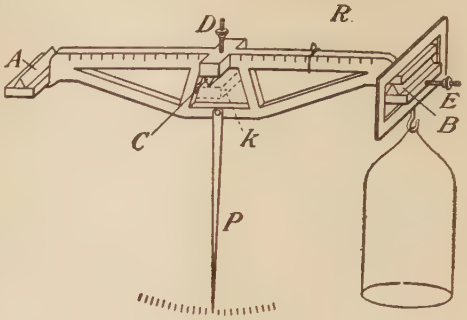

Fig. 1

resistance. (The agate slab is suggested by the dotted contour, *k,* in the figure; the pillar that supports *k* being omitted for the sake of clearness.) Knife-edges similar to the central one, but with their edges directed upward instead of downward, are provided at the respective ends of the beam (as shown at *A* and *B*) for the support of the pans (only one of which is shown) in which the masses to be compared are placed. The three knife-edges, *A, B,* and *C,* must be made with great care, and must be set in position so that they shall be accurately parallel to one another. They must, moreover, have their edges all in the same plane, so that a straight line joining any two points in the edges of *A* and *B* will likewise pass through the edge of *C.* The two arms of the beam should also be precisely equal, so that *C* is exactly half way between *A* and *B.* *P* is a pointer whose free end travels over a graduated scale, so as to indicate the extent of the oscillations of the beam as it swings to and fro on the central knife-edge *C.* When the beam is horizontal, its centre of gravity (*G* in Fig. 2) should lie in

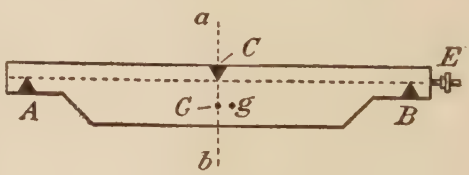

Fig. 2

the same vertical line, *ab,* with the central knife-edge. Whether this condition is fulfilled or not is easily shown by removing the scale-pans and allowing the beam to come to rest. It can only be in equilibrium when its centre of gravity is directly below the knife-edge *C;* so that if it comes to rest in a horizontal position it is evident that the condition specified above is sensibly realized. If, on the other hand, the beam, when freed from the pans, comes to rest with its right-hand end lower than the left-hand one, it is evident that the centre of gravity of the beam is too far to the right, as is indicated by the point *g.* The better makes of balance are provided with an adjustment to correct an error of this sort. This adjustment may take the form of a fine screw-thread carry-

ing a nut, as suggested at *E*. If the nut be caused to approach *B*, the centre of gravity of the beam (considering the nut as a part of the beam) will thereby be shifted toward the left, and after a number of trials the point *g* may be made to coincide with *G*, so that the beam, when free from the pans, comes to rest in a perfectly horizontal position. If it does not remain horizontal when the pans are suspended in their proper places, then it follows that one of the pans is heavier than the other; this defect is easily remedied by the use of a light counterpoise in connection with the lighter pan, or by removing a small portion of the material of the heavier one.

The centre of gravity of the beam being properly adjusted, and the equality of the two pans being assured, it is evident that the beam will set itself in a horizontal position when the pans are empty. The balance may still be defective, however, through the arms not being of precisely equal length. The equality of the arms may be tested in the following manner: Let a mass, *P*, be placed in one of the pans, and suppose that *w* is the mass that has to be placed in the other pan in order to secure a perfect balance. Let *L* be the length of the arm from which *P* is suspended, and *l* be the length of the arm from which *w* is suspended, as indicated in

FIG. 3

Fig. 3. Then, by the principle of the lever, we have —

$$P \times L = w \times l.$$

Next, let *P* be placed in the other pan, connected with the arm whose length is *l*, and yet *W* be the mass that must be suspended from the arm of length *L*, in order to secure a perfect balance. We then have the equation —

$$P \times l = W \times l.$$

Now, if *P* be eliminated between these two equations, we have the relation —

$$L \div l = \sqrt{w \div W};$$

and since *W* and *w* are both known, it follows that the ratio of the two arms of the balance is also known. If this ratio does not come out sensibly equal to unity, its value may be carefully determined, and allowance made for the inequality of the arms after a weighing has been performed. The effect of inequality in the arms may also be eliminated by a double weighing, such as has been supposed to be performed, above. For if we eliminate *L* (instead of *P*) from the foregoing equations, we find —

$$P = \sqrt{W \times w};$$

that is, the true weight is the geometric mean between *W* and *w*. In practice the arms of a good balance are so nearly equal that the simple arithmetic mean of *W* and *w* is a sufficiently close approximation to the geometric mean required by theory.

The sensitiveness of a balance depends largely upon the position of the centre of gravity of the beam relatively to the central knife edge. Thus, if the arms of the balance are precisely equal, and the beam hangs perfectly horizontal with a weight *P* in each pan, the angle, *x*, through which the beam turns when the weight in the left-hand pan is increased to $P + p$, may be taken as a measure of the sensitiveness of the balance. Let *S* be the weight of the beam itself, and let the centre of gravity of the beam be at a distance, *h*, below the central knife-edge when the beam is horizontal. Then, if *x* is the angle that the beam makes with the horizontal when it comes to rest with $P + p$ in the left-hand pan and *P* in the right-hand pan, the theory of the lever gives the equation (see Fig. 4) —

$$(P + p).L.\cos x = P.L.\cos x + h.S.\sin x,$$

from which we easily obtain —

$$\tan x = \frac{L \times p}{h \times S}.$$

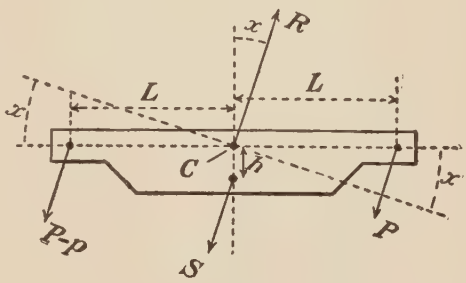

FIG. 4

It is evident that *x* will be increased as *h* is decreased, so that the sensitiveness of the balance becomes greater the nearer the centre of gravity of the beam is caused to approach to the centre of support. The balance should be provided with a thread and nut, *D* (see Fig. 1), to facilitate the vertical adjustment of the centre of gravity, in the same way that *E* is used in adjusting the horizontal position of that point. The centre of gravity of the beam must always remain below the centre of support, because when it is above that point the beam is unstable, and when it coincides with the centre of support the instrument will remain in equilibrium in any position. When a balance is made very sensitive, by bringing the centre of gravity close to the point of support or by increasing the length of the arms of the beam, the period of oscillation of the beam grows very long, so that the instrument is tedious to use. The experienced chemist or physicist therefore selects a balance whose sensitiveness and period of oscillation can be best adapted to the work he has in hand.

The "precision balance" is a delicate instrument, and should be kept in a glass case, for protection, when not in actual use. The weighings are also performed with the balance enclosed in like manner, in order to avoid error from the effect of air-currents upon the beam. The knife-edges should be kept away from their bearings, and provision is always made for raising the pans from the ends of the beam, and the beam itself from the central support, by means of a system of stops and levers (not here shown) actuated by a conveniently situated lever or wheel. The beam and pans should always

be raised in this manner when changing the weights in the pans, in order to avoid giving the least shock to the knife-edges; for when these are dulled or otherwise injured the accuracy and sensitiveness of the balance are materially lessened.

Weighings may be effected by two general methods. In the first method the position of the pointer, P (in Fig. 1), is noted on the scale at its extremity when the balance is at rest with the pans empty. The position so recorded is called the "zero" of the balance. The object to be weighed is then placed in one of the pans, and weights are added to the other pan until the balance will come to rest with its pointer at the same spot, or zero, as before. The weighing is then complete.

In the second method of conducting the experiment (known as the "method by oscillations") the balance is not brought to rest at all, the necessary readings being taken while the beam is oscillating. The zero reading of the pointer is first obtained (with the pans empty) in the following manner: The empty balance is allowed to oscillate freely for a short time, and then the position attained by the pointer at one of its extreme positions toward the right is noted. The reading of the next following extreme position to the left is then taken, and so on, observing the positions attained at the alternate right and left swings, just as the pointer pauses and begins to return toward the mean position. The last reading is taken on the same side as the first, so that there is an odd number of observations on one side of the zero, and an even number on the other side. The readings on the right are then averaged together, and those on the left are also averaged in the same way; after which the mean reading on the right is averaged with the mean reading on the left, and the result is taken as the position of the zero of the balance. The object to be weighed is then placed in one pan, and the weights in the other, the process of guess and trial being followed here just as in the preceding method until an almost exact balance has been attained. The method of oscillations, with alternate readings to the right and left, is next repeated in precisely the same manner as when the pans were empty, and the reading obtained by the final averaging of these observations is taken as the reading of the balance for the loads that are in the pans at the time. A very small weight is next added to one of the pans, and the oscillations are again observed, under the new conditions, precisely as before. The weight of the object under examination can then be determined by simple proportion. Thus, suppose that the original zero reading of the pointer, with the pans empty, was 11.6. The object to be weighed being placed in one pan, and weights having a combined mass of W in the other, let the reading of the pointer (as deduced from the oscillations) be 10.4. The small mass, w, being then added to W, let the final reading of the pointer be 12.2. The following facts are now known: With empty pans the pointer reads 11.6. With the unknown mass (which may be denoted by P) in one pan, and a mass, W, in the other, the pointer reads 10.4. Finally, with P in one pan and $W + w$ in the other, the pointer reads 12.2. The mass w has displaced the reading of the pointer by 1.8 divisions. If it be assumed that a mass x, when added to W, would have made the reading of the pointer precisely 11.6, as it was with the empty pans, we have the additional fact that a mass x would alter the reading of the pointer by 1.2 divisions. Hence the simple proportion —

$$x : w :: 1.2 : 1.8;$$

whence $x = \frac{2w}{3}$, and therefore the concluded mass of P is $W + \frac{2w}{3}$.

The method of oscillations is favored by many physicists, in the belief that a better value of the zero of the balance can be obtained by studying the free swings in this way than by allowing the instrument to come to rest. Instead of adding very small weights to secure the last adjustments, the "rider" is often used. This consists of a tiny weight made of wire, and suspended on the beam of the balance, as indicated at R in Fig. 1. The beam is graduated when a rider is to be used, and the final step in the weighing consists in observing what position the rider must have in order to make the balance perfect. The effect of moving the rider one division on the beam being known by previous experiment, the correction to be applied for any given position of the rider is easily calculated. Obviously the rider can be used with equal advantage whether the weighing is conducted by the method of oscillations or not.

The weights used in connection with precision balances must be accurately compared among themselves if refined work is to be done, and a table of corrections prepared, by means of which the proper allowances may be readily found, for any minute inconsistencies that may exist among them. Reference must be made to the standard works on experimental physics for the details of the process by which these corrections are obtained. Crookes' classical paper on the atomic weight of thallium 'Philosophical Transactions,' (1873, p. 277) may also be consulted with advantage, as it contains full details on this point, as well as on many others in connection with accurate weighing. (For further information on the theory and use of the precision balance, see Stewart & Gee, 'Lessons on Elementary Practical Physics,' Vol. I, and Glazebrook & Shaw, 'Practical Physics.' Much advanced information may also be had in the 'Travaux et Mémoires' of the International Bureau of Weights and Measures.) See also CHRONOMETER; INDUCTION BALANCE; TORSION BALANCE.

Balance of Power, is the system by which greater states are withheld from absorbing smaller ones. Vattel, in 'Law of Nations,' thus defines it: "By this balance is to be understood such a disposition of things, as that no one potentate or state shall be able absolutely to predominate and prescribe to the others." The system of the balance of power is entirely the outgrowth of the modern political system of Europe, as it began to shape itself in the 15th century; not that it was entirely unknown to the ancients before the irresistible progress of Roman arms put any idea of balance out of the question, but these early efforts after the balance of power were not sustained for a sufficiently long period, from generation to genera-

tion, from century to century; were too transitory and casual to entitle them to be elevated into a system. They must be regarded as approaches and tentatives, interesting, but in the end fugitive and unsuccessful. During the latest centuries of the Middle Ages, the kings of France and the emperors of Germany were too much engaged in their domestic struggles with their great vassals, to spare the concentrated attention and energy upon international affairs necessary to originate and sustain a system of balance in Christian Europe. In Italy, then so far in advance of the rest of Europe in intellectual, social, and political development, the princes, podestas, and republics of that peninsula, from an early period of the 15th century, had built up the institution of an equilibrium for their mutual regulation. But this was too local and on too small a scale to be deemed the parent of our modern system. Not until Louis XI. of France had repressed the Dukes of Burgundy and Brittany, not until Ferdinand of Castile and Aragon had united almost the whole of modern Spain under his sway, not until Maximilian in Germany, and Henry VII. in England and Ireland had consolidated the monarchical authority, was the time ripe for the application of this idea. The invasion of Italy by Charles VIII. of France, and his claim to the kingdom of Naples, in 1494, gave rise to the first great European combination of otherwise hostile powers for the repression of the ambition of one. Almost all the Italian states, Maximilian, the German emperor, and Ferdinand of Aragon, suspended their animosities, and drove the French out of Italy. The Emperor Charles V. of Germany, Spain, Burgundy, the Netherlands, and a vast transatlantic empire, 1519–56, caused the jealousy of Europe. Francis I. of France, actually went so far as to ally himself with the sultan, Solyman the Magnificent, against Charles. The Turks at one end of Europe, the kings of France and England at the other, and the opposition of the Protestant princes in the centre, prevented Charles from realizing his ambitious schemes. The misfortunes of Philip II., the son of Charles V., in the Dutch Netherlands and in the expeditions against England and the English power in Ireland, effectually dissipated the fears Europe entertained concerning the overgrown power of the Spanish branch of the house of Hapsburg. The idea of a European equilibrium had now become sufficiently definite for Henry IV. of France to propose to Elizabeth of England, at the commencement of the 17th century, a scheme for a federative congress, whose purpose it should be to maintain the peace of Europe in the same manner as the great powers do now. The idea was impracticable in those days, and was entirely abandoned even as a project, on the assassination of that liberal and high-minded prince. The next potentate whose power gave general alarm and caused a coalition against him in the general interest, was the emperor Ferdinand II. of Germany (reigned 1619–37). Gustavus Adolphus, of Sweden, appealing to the Protestant princes of Germany, subsidized by Richelieu, the French minister, and supplied with men by England and the united provinces of the Netherlands, achieved the task of humbling the power of the house of Austria. After the death of Gustavus, Oxenstiern of Sweden, and Richelieu of France, together forced upon the German emperor the celebrated Treaty of Westphalia (1648), which relieved Europe from the fear of the house of Austria, and put an end to the Thirty Years' war. The next general danger came from France. The invasion by Louis of the Dutch Netherlands (1672), brought about a coalition of Holland, the emperor of Germany, the elector of Brandenburg, and the king of Spain, against the French king. William, prince of Orange, was the hero of this war; but the Peace of Nimeguen (1678) sealed the supremacy of Louis XIV. The will of the king of Spain nominating the second son of the French dauphin as his successor (1700), thus putting the powerful monarchies of France and Spain into the same hands and utterly destroying the European equilibrium, created the grand alliance and the war of the Spanish succession. The emperor of Germany, the Duke of Savoy, the king of England, and the states-general of the United Provinces, united in this grand alliance. The king of Portugal afterward joined the anti-French confederacy. Marlborough and Prince Eugene of Savoy were the great military leaders in behalf of the balance of power. The Peace of Utrecht (1713), by which the union of the French and Spanish crowns was prevented, and the territorial conquests of France almost wholly surrendered, re-established the influence of the equilibrium doctrine, and secured Europe from danger on this side until the era of the French republic. The Empress Elizabeth, of Russia, was the first Russian potentate who took part in wars in which she had only a remote general interest. Prussia and Russia, celebrated their entry into the rank of first-class powers by dealing the most terrible blow to the balance of power which it has ever suffered. The first partition of Poland (1771–72) is admitted by every writer on this subject to be at war with the fundamental principles on which the equilibrium rests. The achievement of American independence (1783), though not generally reckoned by European writers as belonging to the history of the international balance, may well be included therein, inasmuch as it put an end to the overgrowth of British colonial power and British naval preponderance. At the Congress of Vienna (1814–15), it was the leading wish of Lord Castlereagh, the British plenipotentiary, to restore the kingdom of Poland, as included in the European equilibrium, in which he was seconded by Metternich for Austria, and Talleyrand for the French legitimate sovereign, but opposed by the representatives of the Russian and Prussian monarchies. The return of Napoleon from Elba put an end to this difference, and in the renewed conferences after the battle of Waterloo, the western powers did not insist upon the point. From 1815 to 1853, the world was substantially preserved from any war of importance by the five great powers who then presided over the destinies of Europe, namely, France, Great Britain, Russia, Austria, and Prussia. In 1853, the invasion of the trans-Danubian provinces of the Turkish empire by a Russian army was declared by a congress of the great powers at Vienna to be a breach of the political equilibrium. In this declaration France, Great Britain, Austria, and Prussia agreed. An Anglo-French alliance was made (1854) to repel the aggression, and the confederation of Turkey, Great Britain, and France, was reinforced by the king of Sardinia in the spring of the year

1855. After a war of three campaigns, the Treaty of Paris was signed (30 March 1856), by which Russia abandoned her claims, and the principle of the balance of power was anew vindicated. The Congress of Berlin in 1878, acting in the interests of the balance of power, deprived Russia of many benefits gained through the Treaty of San Stefano. Within a generation, the principle of nationalism has arisen in opposition to that of the balance of power. This is exhibited in United Italy, United Germany, and the spread of Pan-Slavism in Russia, but as a set-off to this may be mentioned the extension of European influence in Asia and Africa as regards colonization and trade. Thus the balance of power has become a world question and such nations as Germany and Italy are desirous of acquiring colonies to balance the colonial possessions of Russia and England. At present the balance of power in Europe is held by the six nations of Great Britain, France, Germany, Austria, Russia, and Italy.

Balance of Trade. The so-called balance of trade is a theory arising from the apparent relation of exports to imports. The protectionist school of political economy holds that excess of exports over imports constitutes what is termed a "favorable balance," which must be returned to us in gold and silver, this being the profit to the nation on its foreign trade. According to this theory the one desirable thing in foreign commerce is the exportation of merchandise. It should be said that all protectionists do not share in a belief in this theory.

In a great measure, and in its more exaggerated form, this doctrine is a survival of the old mercantile theory, which down to the time of Adam Smith controlled most of the legislation relating to commerce, and which held that gold and silver were the only wealth. It still retains a firm hold on the popular mind, but it may be said that the full weight of the teachings of orthodox political economy is against the notion that excess of exports constitutes a favorable balance.

The argument of the latter is that if the theory is true there cannot be too great an excess of exports, and that our imports should therefore consist only of gold and silver. In this "reduction to absurdity" (since a country has no more need of an excessive supply of the metals than of any other commodity) the free-trade school of political economy rejects the conclusions based upon the apparent excess of exports over imports.

Opponents of the theory hold that such trade as exists between two countries, exclusive of what is paid as interest, rent, or tribute, must show a mutual profit, and represent to each a corresponding excess of the value of importation. For illustration: A commodity costing in one country $75 will be bought in another for $100, in exchange for a commodity costing $75 in the country of its exportation and $100 in the importing country, such difference representing the degree of desirability of these particular commodities to each country. It will be observed that this precisely reverses the "balance of trade" theory.

Countries may be able to show a favorable balance from two causes, neither of which contributes to their prosperity. It may result from an actual drain, as in the case of Ireland, which is being sapped of its wealth by absentee landlords, and in India, where the same phenomenon is caused by a similar drain in the form of tribute, official salaries spent outside the country, pensions, etc. But in these instances it is clear that there is a condition unprofitable to both countries. Or, on the other hand, it may result, as in the United States, which has the same favorable balance, by reason of the large sums annually paid as interest on loans that entered originally into railroad building, industrial improvements, etc. Most of the royal families of Europe, not to mention less exalted individuals, draw large dividends from American investments. Money spent by American tourists abroad helps to swell this favorable balance.

For proof that this theory has no such relation to national prosperity as its friends conceive, its opponents point to England, whose commercial greatness is rivalled by this country alone, and which has a prevailing "unfavorable" balance, because she has been the money-lender of the world, and her excess of imports represents the return received by her people for moneys invested in foreign lands.

It is impossible to account for the growing increase of our own export balance wholly on the explanation that such excess is rent or interest upon loans. Much of such excess is indeed fictitious, and is to be accounted for by undervaluation of imports and overvaluation of exports. In the latter case there is a strong inducement to overvalue, in order to conceal the fact that many of our exporters are selling goods cheaper abroad than at home. The inducement to undervalue imports is quite as strong. In short, customs statistics, with every desire on the part of the treasury department to be accurate, are of necessity unreliable.

Balanga, bạ-lăn'gạ, Philippines, in the province of Bataan, on the western coast of Manila Bay, in the Island of Luzon. It has a post-office and telegraph station. Pop. about 9,000.

Balani'tis, an inflammation of the mucous membrane of the foreskin. It is a common condition and is due to uncleanliness. Quacks and charlatans magnify its importance, declare it to be a fearful malady, and promise miraculous cures. Ordinary cleanliness will cause a balantis to disappear in a few days. This cannot happen if the local trouble is of a venereal nature.

Balanoglos'sus, a worm-like marine animal, the chief representative of the most primitive class of chordate animals, *Enteropneusta* or *Adelocephala.* This remarkable creature, the type of its class, combines characters peculiar to itself, with features reminding us of the nemerteans, annelids, tunicates, and the vertebrate omphioxus, while its free-swimming larva was originally supposed to be a young echinoderm. From the fact that the central nervous system lies above a notochord, Bateson placed it next to the vertebrates.

One American species, *Balanoglossus aurantiacus,* is a long, cylindrical, soft, fleshy worm, footless, without bristles, but with a large, soft, whitish, tongue-shaped proboscis in front arising dorsally within the edge of the collar surrounding the mouth. The surface of the body is ciliated. At the beginning of the digestive

canal is a series of sac-like folds of which the upper or dorsal portion is respiratory and separated by a constriction from the lower, which is digestive, and leads directly to the intestine behind. This pharyngeal respiratory portion of the digestive canal has on each side, in each segment, a dorsal sac, the two communicating along the median line of the body. The dorsal respiratory sacs each bear in their walls a delicate chitinous gill-support or -arch. Between the gill-arches, forming numerous lamellæ, are a series of slits, leading on each side to openings (spiracles), situated dorsally. The water passes through the mouth into each gill-sac, and out by the spiracles. The nervous system lies above a short sac regarded as a notochord. There is a dorsal blood vessel, which sends branches to the respiratory sacs, and a ventral vessel. The worm lives in sand at low-water mark from Cape Ann to Charleston, S. C., also in the Mediterranean.

The life-history of this worm is most interesting. The young, originally described under the name of *Tornaria,* was supposed to be an echinoderm larva, though it resembles the larval *Gephyrea* and *Annelida.* It is a transparent, surface-swimming, minute, ciliated, slender, somewhat bell-shaped form, with black eye-specks. When transforming to the worm condition, a pair of gills arise on sac-like outgrowths of the œsophagus, and afterward three additional pairs, with their external slits, arise, somewhat as in ascidians. The entire Tornaria directly transforms into the worm, the transitional period being very short. The body lengthens, the collar and proboscis develop, afterward the body lengthens, the end tapering and becoming much coiled.

Consult: A. Agassiz, 'The History of Balanoglossus and Tornaria' ('Memoirs of the American Academy of Arts and Sciences,' Vol. IX, Boston, 1873); 'The Later Stages in the Development of Balanoglossus Kowalevskii, etc.' ('Quarterly Journal of the Microscopical Society,' London, 1885–6.)

Balantidium, băl-ăn-tid'i-um, a genus of *Infusoria,* some members of which, notably *B. coli* have been found in the large intestine, where they cause symptoms of intestinal derangement, anæmia, peevishness, and other symptoms of an intestinal parasite. The diagnosis is made by means of the microscope. Quinine enemas, five grains to the pint, are usually curative. See INTESTINE — *Intestinal Parasites.*

Bal'anus ("acorn-shells"), a genus of sessile cirripeds, family *Balanidæ,* of which colonies are to be found on rocks at low water, on submerged timbers, crustaceans, shells of mollusks, etc. They differ from barnacles in having a symmetrical shell and being destitute of a flexible stalk. The shell consists of six plates with an operculum of four valves. They pass through a larval state in which they are not fixed, moving by means of swimming-feet which disappear in the final state. All the *Balanidæ* are hermaphrodites. A South American species (*B. psittacus*) is eaten on the coast of Chile, the *B. tintinnabulum* by the Chinese. The old Roman epicures esteemed the larger species.

Balao, ba-lā'ō, a West Indian name, among Spanish-speaking fishermen, for the half-beaks (q.v.).

Balard, ba-lär, **Antoine Jerome,** French chemist: b. Montpellier, 30 Sept. 1802; d. Paris, 31 March 1876. He was professor of chemistry at the Collège de France, Paris, and discoverer of bromine; also of a process of extracting sulphate of soda directly from sea-water. In 1868 he was made Inspector-General of Superior Instruction.

Balas Ruby, a variety of ruby spinel.

Balashov, băl-a-shōf', a Russian town in the government of Saratov, situated on the Don, 170 miles west of the city of Saratov. It has a considerable export trade of grain, etc. Pop. about 13,000.

Balasore, băl-a-sōr', a city of Bengal, British India, capital of the district of Balasore. It is situated near the coast and has dry docks and a considerable coasting trade. Pop. about 20,000.

Bal'ata, băl'a-ta, a rubber-like exudate derived from the milky juice of *Mimusops balata* and *M. schomburgkii.* The gum is used widely in the arts, and is sometimes confused with gum chicle, from which much of the chewing-gum of commerce is derived.

Balate, ba-lā'ta, the Philippine name for a kind of trepang (*Holothuria atra*).

Balatka, bă'lăt-ka, **Hans,** musician: b. Hoffnungsthal, Moravia, 1828. After studying music in Vienna he settled in Milwaukee, Wis., where he founded the Musikverein in 1851, which he conducted for nine years. He then removed to Chicago, where he organized the Liederkranz, the Mozart Club, and conducted the Philharmonic Society and the Symphony Society.

Balaton, bŏ'lŏ-tōn, or **Platten See,** a lake in the southwest of Hungary, extending from lat. 46° 45′ to 47° 5′ N., and from lon. 17° 14′ to 18° 10′ E.; area about 110 square miles, or, including the marshy shores, about 138 square miles. It receives the waters of more than 30 small streams. It discharges through the Sio, which empties into the Sarviz, an affluent of the Danube. The Balaton is constantly in a state of motion, sufficient to cause waves. Its waters are perfectly transparent and abound with fine fish, notably one called *fogas,* frequently 20 pounds in weight, and with delicious flesh of snowy whiteness. Another kind, resembling the herring, swarm in the lake during the winter in such shoals that fishermen sometimes haul 50 cartloads from under the ice in a single day.

Balauang, bä-low-äng', Philippines, a town in the province of La Unión, Luzon, north of San Fernando. Pop. about 25,000.

Balau'stion's Adven'tures, a poem by Robert Browning, describing a Greek girl of Rhodes. 'Aristophanes' Apology' is a continuation of this poem.

Balawat, bä-la-wät', a ruined city of Asiatic Turkey, 10 miles from Nimrud. Excavations there have resulted in the finding of the ruins of the palace of Shalmaneser II. The bronze gates that opened into the vestibule of this palace are especially interesting and valuable, and have been placed in the British Museum.

Balayan, bä-lä'yan, Philippines, a town of Batangas province, Luzon, situated on the Gulf of Balayan, northwest of the town of Batangas. Pop. about 25,000.

Bal'bec. See BAALBEK.

Balbi, bäl'bē, Adriano, famous geographer: b. Venice, 25 April 1782; d. Padua, 14 March 1848. In 1808 his first work on geography procured his appointment as professor of that science in the College of San Michele, at Murano, and in 1811 he became professor of natural philosophy in the Lyceum at Fermo. Having married an actress, he went in 1820 to Portugal, where he became acquainted with the leading scholars and statesmen. He had free access to the government archives, and from the documents he collected, composed two interesting works entitled 'Essai Statistique sur le Royaume de Portugal et d'Algarve, Comparé aux Autres États de l'Europe,' and 'Variétés Politiques et Statistiques de la Monarchie Portugaise,' which he published at Paris in 1822. He followed his scientific pursuits in that metropolis, and four years later produced the first part of his 'Atlas Ethnographique du Globe, ou Classification des Peuples Anciens et Modernes d'après leurs Langues,' a work of superior arrangement, in which he spread before the French public the result of the researches and disquisitions of the German philologists. He published afterward, in concert with several scientific men, statistical tables of Russia, France, the Netherlands, etc. He now gave all his attention to his 'Abrégé de Géographie Rédigé sur un Plan Nouveau,' a summary of geographical science which appeared in 1832 and has been translated into nearly all the European languages. Then he retired to Padua, where he published, in 1835, his 'Essai sur les Bibliothèques de Vienne.' Beside the works above-cited mention may be made of 'La Monarchie Française Comparée aux Principaux États de l'Europe' (Paris, 1828); 'Balance Politique du Globe' (1828); 'L'Empire Russe Comparé aux Principaux États du Monde' (1829); 'The World Compared with the British Empire' (1830); 'Statisque Comparée de l'Instruction et du Nombre des Crimes' (1829). Balbi was also a contributor to many important publications, 'L'Encyclopédie des Gens du Monde' and 'Le Dictionnaire de la Conversation.' His works show a great amount of knowledge, thorough research, and skilful arrangement of material; but, being utterly deficient in style, they are heavy and of difficult reading; however, they may always be advantageously and safely consulted.

Bal'bi, Gasparo, Venetian dealer in precious stones, who lived in 16th century. He traveled first to Aleppo and thence down the Euphrates and Tigris to the Malabar coast, sailing finally for Pegu, where he remained two years. His 'Viaggio all' Indie Orientale,' published on his return to Venice in 1590, contains the earliest account of India beyond the Ganges.

Balbi, Giovanni, called DE JANUA or JANUENSIS, from his birthplace, Genoa, a Dominican friar, who lived toward the end of the 13th century. He composed a kind of encyclopædia, which he called the 'Catholicon.' This book owes its celebrity principally to the fact that it has become one of the earliest monuments of the art of printing. The original edition is to be found under the title, 'Summa Grammaticalis valde Notabilis quœ Catholicon Nominatur' (Moguntiæ, per Johannem Faustum, 1460, fol.). It was reprinted at Augsburg, 1469 and 1472, by Schoeffer; at Nuremberg, 1483, by Koburger; at Venice, 1487, revised and improved, by Pietro Gilles.

Balbi'nus, Decimus Cælius, Roman senator and poet. After the death of the two Gordiani, killed by the soldiers of Maximinus, he was elected emperor by the Senate, concurrently with Clodius Pupienus Maximus, in opposition to the usurper Maximinus. The two emperors reigned little more than one year, and were assassinated by their soldiers 238 A.D.

Bal'bo, bäl'bō, Cesare, Count, Italian statesman and author: b. Turin, 21 Nov. 1789; d. 3 June 1853. Through the favor of Napoleon he was appointed auditor to the French privy council in 1807, and afterward became secretary to the French commissioners charged with the organization of Tuscany and the Papal States. In 1812 he was promoted to the office of commissioner of Illyria, and after the downfall of Napoleon became secretary of the Sardinian ambassador in London until the outbreak of the Sardinian revolution in 1821, when he returned to his native town in order to devote himself to literary pursuits. He wrote a history of Italy up to the time of Charlemagne, and translated Heinrich Leo's 'Exposition of the Municipal Institutions of Lombardy,' from German into Italian, under the name of 'Comuni Italiani.' His reputation was not firmly established, however, until the latter year, when his 'Speranze d'Italia' made its appearance. His appeal in favor of a national independence found a powerful echo in the popular heart, and paved the way for the revolution in which he was destined to play a prominent part as a champion of the moderate party. His next work, printed at Bastia, in 1849, 'Della Storia d'Italia, dall' Origine Fino al 1814' (History of Italy, from the Beginning to 1814), was not only inspired by the same patriotic spirit, but also distinguished by historical merit. But although in 1848 and 1849 he had strenuously opposed the democratic party and unwaveringly adhered to a more conservative policy, he threw the entire weight of his political influence into the scale of patriotism as soon as the war against Austria began. He supported the different cabinets which governed Sardinia after the promulgation of the constitution of 4 March 1848, and, though for a very short time, was personally connected with the government. He became a regular contributor to the *Risorgimento*, a leading paper of Turin, and in it gave a constant support to D'Azeglio's administration.

Balboa, bäl-bō'a, Vasco Nuñez, the discoverer of the Pacific Ocean: b. Jerez de los Caballeros, Spain, 1475; d. 1517. At the age of 25 he went to America to seek his fortune, joining the expedition of Rodrigo de Bastidas (see CENTRAL AMERICA), and returned to Española, (Haiti), after exploring with Bastidas a part of the southwestern coast of the Caribbean Sea. At the town of Salvatierra in Española he became a planter, but with such indifferent success that, when he resolved to attach himself

to Alonzo de Ojeda's new colony on the mainland of South America, he found difficulty in escaping from his creditors. To elude their vigilance, he hid in a large cask, and thus was carried from his plantation to the landing, and thence on board one of Ojeda's vessels, as a part of the cargo. It is probable that when he emerged from his place of concealment he would have been handed over to the authorities on shore if the expedition had not stood in need of every available fighting-man. Admitted to membership reluctantly, and as a common soldier, Balboa showed his talent for leadership when the undertaking seemed on the point of failure. He suggested transferring the colony to Darien, describing the more favorable conditions there, as he had seen them on his previous voyage. His advice was taken, and the name Antigua (Santa Maria de la Antigua del Darien) was given to the new settlement. Here the Spaniards were somewhat more successful and Balboa assumed command.

In the year 1513 he received a letter from a commissioner whom he had sent to Spain, informing him that he might expect to be summoned to court to answer grave charges. Resolving to win back the royal favor by some striking service, he selected 190 men, the best of his soldiers, and with these and 1,000 native warriors and carriers, and a pack of bloodhounds, sailed from Antigua, 1 September 1513, following the Darien coast westward until he reached a point opposite the Gulf of San Miguel. This gulf extends far into the south coast from the Pacific, narrowing the isthmus to a width of 50 miles. Accurate information in regard to the southern coast, the ocean that lay beyond, and the superior civilization of the Incas of Peru, whose country was to be reached by way of this ocean, had been obtained from the Indians, especially through Balboa's favorite Indian mistress, Fulvia.

The march began 6 September. On the 24th reaching an elevated plateau, the Spaniards repulsed an attack by 1,000 Indians and found supplies in the village of Quarequá. The following day, 25 September 1513, Balboa gained the summit of a mountain from which the waters of Mar del Sur (southern sea) were visible. The name, Pacific, was not applied to this ocean until seven years later, when it was bestowed by Magellan. On 29 September Balboa took formal possession of the «Southern Sea» by marching into the water, and, in the names of the king and queen of Castile, claiming «these seas and lands.»

The warning received from the Spanish court was justified in the event. Balboa had already been superseded by Pedrarias. The reward of the former was an empty title of Adelantado of the Southern Sea; while on shore he was made the subordinate of his rival and bitter enemy, Governor Pedrarias. Three years later a South Sea expedition was in prospect, and Balboa, instead of Pizarro, might have been the conqueror of Peru; but the governor's jealousy was aroused, and Balboa was executed at Acla.

MARRION WILCOX,
Authority on Latin-America.

Balbrig'gan, a watering place in County Dublin, Ireland, 21 miles north of Dublin. It is a seat of linen, cotton, calico, and stocking manufactures. The cotton stockings made here are remarkable for fineness of texture and beauty of open work. Many women are employed in embroidering muslin.

Balbus, Lucius Cornelius, Roman officer, sometimes surnamed MAJOR, to distinguish him from his nephew (see below): b. Gades, Iberia, in the 1st century. He served his first campaign under Q. Metellus Pius and Pompey. For his conduct in this war the privileges of a Roman citizen were conferred on him, his brother, and his nephews. In 72 B.C. Balbus removed to Rome, and soon became an intimate friend of Cæsar. He was consul in 40 B.C., and is supposed to have been the first adopted citizen to fill that office. He wrote a diary in which he described the chief events in his own and Cæsar's life.

Balbus, Lucius Cornelius (MINOR), nephew of the above, a Roman officer, who in acknowledgment of a victory gained in Africa, was awarded the honor of a triumph, the first ever paid to one not born in Rome.

Balch, George Beall, American rear-admiral: b. Tennessee, 3 Jan. 1821. He was appointed to the navy from Alabama 1837, was promoted passed midshipman 1843, and served through the Mexican war. He was with Commodore Conner's squadron in the first attack on Alvarado, with the mosquito fleet under Commodore Tatnall, and at the bombardment and surrender of Vera Cruz. As a lieutenant on the Plymouth he was with the Asiatic squadron 1851–5, and received a hip wound in a fight between the rebels and imperialists at Shanghai, China. During the Civil War he commanded the Pocahontas and Pawnee, taking part in numerous engagements with the Confederate batteries, chiefly in South Carolina. He became captain, 25 July 1866; commodore, 13 Aug. 1872; rear-admiral, 5 June 1878; and was retired in 1883.

Balcony, a gallery or framework of wood, iron, or stone, projecting from the front of a house, generally on a level with the floors of rooms, and supported on cantilevers or brackets, and sometimes on columns of wood or stone. Balconies are often surrounded by iron railings or stone balustrades. The etymology of the word has been frequently traced to the Greek *βαλλειν,* to throw. This rests upon the presumption that balconies were built originally for purposes of defense, the enemy being attacked with missiles thrown upon him from the balcony. The Latin word is *balcus* or *palcus,* the Italian *balcone,* also *balco* or *palco,* the Turkish *bala-khaneh,* the German *balcon.* The use of balconies is comparatively modern, although there is no doubt about their existence in times of antiquity. Winckelmann, the great German writer upon art, refers to the fact that in Greece every private dwelling-house had contrivances which, although then designated under different terms, would be called balconies in our day. In Spain, Italy, and South America, they are used for sitting, walking, chatting, and flirting, in warm summer evenings; but they are less common in northern countries, where the nature of the climate does not call for such romantic contrivances. They are, however, often used as miniature gardens for potted plants. Upon Boccaccio and Bandello, the great Italian novelists of the 16th century, the poetical utility of balconies was not lost, and entertain-

ing balcony scenes abound in their stories. Shakespeare took his plot of Romeo and Juliet from one of Bandello's novels, and the balcony scene exhibits, with that power of genius of which the great English dramatist alone was capable, the beauty of a balcony when two young lovers like Juliet and Romeo make it the witness of their passion.

In modern theatres the term is applied to the first or second gallery or tier of seats above the pit.

Bald Cypress. See CYPRESS.

Bald Eagle, the American white-headed eagle. See EAGLE.

Bald Mountain, the name of several eminences in the United States, of which the following are the principal: (1) In Colorado, height, 11,493 feet; (2) in California, 8,295 feet; (3) in Utah, 11,975 feet; (4) in Wyoming, in the Wind River Range, 10,760 feet; and, (5) in North Carolina, 5,550 feet. The last named was the cause of much excitement in May 1878, because of inexplicable rumblings which lasted for about two weeks. The mountain shook as if in the throes of an earthquake, immense trees and rocks were hurled down its sides, and for a time fears were entertained lest a volcanic eruption should follow. A subsequent examination showed that a large section of the mountain had been split asunder, but no further disturbance occurred.

Baldachin, băl'dą-chĭn. See ALTAR.

Balde, Jakob, bäl'dā, yä'cōb, German Latin poet: b. Ensisheim, Alsace, 1604; d. Neuburg, on the Danube, 1668. He was court-chaplain to the prince electoral of Bavaria, and distinguished himself by the excellence of his Latin poetry. Herder called attention to the beauty and genius of his lyrical productions, many of which he translated.

Balder, bâl'dėr, or **Baldur,** in Norse mythology a divinity, represented as the son of Odin and Frigga, beautiful, wise, amiable, and beloved by all the gods. His mother took an oath from every creature, and even from every inanimate object, that they would not harm Balder, but omitted the mistletoe. Balder was therefore deemed invulnerable, and the other gods in sport flung stones and shot arrows at him without harming him. But the evil god, Loki, fashioned an arrow from the mistletoe and got Balder's blind brother Höder to shoot it, himself guiding his aim. Balder fell dead, pierced to the heart, to the deep grief of all the gods. He is believed to be a personification of the brightness and beneficence of the sun.

Balderstone, bâl'dėr-stōn, **Caleb,** the old butler of the master of Ravenswood, in Scott's 'Bride of Lammermoor.'

Baldi, bäl'dē, **Benardino,** Italian scholar and poet: b. 1553; d. 1617. He was an accomplished linguist and a very prolific writer, and was abbot of Guastalla for 25 years. Among his numerous works are 'Cronica dei Matematici'; 'La Nautica,' a poem on navigation; an Arabic grammar; and a translation of the 'Targum of Onkelos.'

Baldness. Under the title ALOPECIA the general types of baldness have been considered. Premature alopecia, or the general affection of the young and middle-aged, deserves greater consideration. *Alopecia presenilis,* or premature baldness, is recognized as of two distinct varieties, the idiopathic and the symptomatic. In the idiopathic variety that occurs before the age of 45 there does not seem to be any disease of the scalp or of the general nutrition to explain it. It is a gradual and progressive loss of hair, thinner and thinner hairs replacing those that have fallen out, until the follicle will not produce hair. It is usually symmetrical, beginning at the tonsure or running back from the temples. The skin is usually left thin and hard.

In the symptomatic form some general disorder, or a definite disease of the scalp is the cause. This latter is usually a scaly dandruff; the general causes may be syphilis, tuberculosis, fevers or local destructive conditions. Dandruff (q.v.) is the most frequent accompaniment and cause of baldness. Dandruff is really at least three different diseases of the skin, but the general character is that of a general seborrheal dermatitis; that is, a mild inflammation with excessive fatty secretions. This is frequently due to digestive disturbances, and is closely dependent upon the general health of the entire body. The hair falls out as in the idiopathic form. The dandruff usually continues until the hair is gone, and then ceases.

Treatment should be begun early, particularly in those whose families have tended to baldness. The details of treatment require professional advice. The large number of hair-tonics in the market speaks well for the general inutility of all of them. Cleanliness, frequent dry-brushings, and shampoos once in every two or three weeks, are safe measures, and tend to keep up the general hygiene of the scalp. Consult Jackson, 'Diseases of the Skin' (1900). See DANDRUFF.

Baldo, Monte, a mountain in Lombardy, Italy, near Lake Garda, with an elevation at its highest peak of 7,275 feet.

Baldovinetti, bäl'dō-vē-nĕt'tē, **Alessio,** Florentine artist: b. 1422; d. 1499. Few of his works remain except a 'Nativity' in the Church of the Annunziato, and two altar-pieces in the gallery of the Uffizi and the Academy of Arts, Florence.

Baldpate, or **Baldhead,** the name of several different birds having a white head, as an eagle, one of the widgeons, a kind of domestic pigeon, a West Indian dove, a fruit-crow, etc.

Baldric, bâl'drĭk, a belt or sash worn over the right or left shoulder diagonally across the body, often highly decorated and enriched with gems, and used not only to sustain the sword, dagger, or horn, but also for purposes of ornament and as a military or heraldic symbol. The fashion of wearing a baldric appears to have reached its height in the 15th century. In the United States it now forms a part of the uniform of Knights Templar and other fraternal organizations.

Balducci, bäl-dō'chē, **Francesco,** leading Italian Anacreontic poet: b. Palermo; d. Rome, 1642. He wrote 'Sicilian Songs' in the Sicilian dialect, etc.

Baldung, bäl'dŭng, **Hans,** or **Hans Grün,** German painter and wood engraver: b. Suabia, 1470; d. Strasburg, 1522. His work, though inferior to Durer's, possessed many of the same

characteristics, and on this account he has been sometimes considered a pupil of the Nuremberg master. His principal paintings are the series of panels (of the date of 1516) over the altar in Freiburg Cathedral; others of his works are to be found at Berlin, Colmar, and Basel. His numerous and often fantastic engravings have the monogram H. and B., with a small G. in the centre of the H.

Bald'win I., king of Jerusalem. He was the son of Eustace, Count of Bouillon, and accompanied his brother Godfrey of Bouillon into Palestine, where he gained the sovereignty of the state of Edessa. He succeeded his brother on the throne of Jerusalem in 1100, and for 18 years waged war against the Turks, the Arabs, the Persians, and the Saracens. He took many towns and secured for the Christians the coast of Syria from the Gulf of Issus to the confines of Egypt. He died at Laris, in the desert in 1118, and was buried on Mount Calvary. In the first canto of Tasso's 'Gerusalemme Liberata,' the poet has depicted the character of this monarch as well as that of his brother, Godfrey.

Bald'win I., the first Latin emperor of Constantinople, son of Baldwin VIII., Count of Flanders and Hainault: b. Valenciennes, 1170. In 1200 he joined the crusaders with his brother, Thierry, and in 1202 aided the Venetians in their attack upon Constantinople, of which city he was crowned emperor 16 May 1204. In the next year Baldwin was taken prisoner by the king of Bulgaria, and, it is said, died in captivity in 1206. He was much esteemed by the Greeks for his charity, temperance, and justice.

Bald'win II., king of Jerusalem, son of Hugh, Count of Rethel. He was crowned in 1118, after Eustace, brother of Baldwin I., had renounced all claim to the vacant throne. In 1120 he gained a great victory over the Saracens, but in 1124 he was taken prisoner by them, and was ransomed only by giving up the city of Tyre. In 1131 he abdicated in favor of his son-in-law, Foulques of Anjou, and retired to a monastery, where he died in the same year. The military and religious order of the Templars, for the defense of the Holy Land, was instituted, it is thought, in the reign of this monarch.

Bald'win II., the last Frank emperor of Constantinople: b. 1217; d. 1273. He was the son of Pierre de Courtenay, and succeeded his brother Robert in 1228. He was twice besieged in his imperial city, and, being too weak to defend his dominions, repaired to Italy to seek aid from the Pope. At the court of France Baldwin was favorably received by the king, St. Louis, to whom he presented a crown of thorns which was held by all Christendom to be the genuine relic. Baldwin, in 1239, set out for Constantinople with a body of crusaders, who, however, soon quitted him and took the route to Palestine. He succeeded, ultimately, in raising new forces in the West, and regained his capital; but in 1261 Michael Paleologus invested it and entered Constantinople on the 29th of July. Baldwin fled to Sicily, where he died in obscurity.

Bald'win III., king of Jerusalem: b. 1130; d. Antioch, 1162. He was son of Foulques of Anjou, whom he succeeded in 1142 under the guardianship of his mother. He took Ascalon and other places; but under his reign the Christians lost Edessa. He was succeeded by his brother, Amaury I.

Bald'win IV., king of Jerusalem: d. 1185. He was son of Amaury, and succeeded to the throne on the death of his father in 1174; but as he was leprous, Raymond, Count of Tripoli, governed the kingdom for him. He afterward resigned the throne to his nephew, Baldwin V., in 1183.

Baldwin V., king of Jerusalem: b. 1178; d. 1186. He was son of Sibylla, sister of Baldwin IV., and was called to the throne when five years old. He died of poison, supposed to have been administered by his mother in order that her second husband, Guy de Lusignan, might enjoy the throne. The following year, 1187, the Christians lost Jerusalem, which was taken by Saladin.

Baldwin, Abraham, American statesman: b. Guilford, Ct., 6 Nov. 1754; d. 1807. He was graduated at Yale in 1772, and was tutor there, 1775–79. During the American Revolution he was a chaplain in the army, and, at the suggestion of General Greene, settled in Savannah, Ga., 1784, where he was admitted to the bar. His efforts as a member of the legislature secured a charter and endowment for the University of Georgia, which was established according to his own plans and ideas, and of which he became president. He took part in the Constitutional Convention of 1787; was a delegate to the Continental Congress 1785–88; member of the House of Representatives 1789–99; United States senator 1799, until his death.

Baldwin, Charles H., American naval officer: b. New York city, 3 Sept. 1822; d. 17 Nov. 1888. He entered the navy as a midshipman in 1839. Serving on the frigate Congress during the war with Mexico, he figured in several sharp encounters near Mazatlan. He commanded the steamer Clifton at the passage of Forts Jackson and St. Philip in 1862, and at the first attack on Vicksburg. He became rear-admiral in 1883, receiving the command of the Mediterranean squadron, and was retired in 1884.

Baldwin, Evelyn Briggs, arctic explorer: b. Springfield, Mo., 22 July 1862. He was graduated from Northwestern College, Naperville, Ill., and engaged chiefly in teaching until 1892, when he entered the United States Weather Bureau service. He is now an inspector-at-large of the signal corps of the United States army. He accompanied, as meteorologist, Peary's North Greenland expedition, 1893–4; joined the Wellman Polar expedition, 1898–99, as second in command, built Fort McKinley, and discovered Graham Bell Land. Securing the co-operation of Mr. William Ziegler of New York he organized and commanded the Baldwin-Ziegler expedition of 1901. He has written 'The Search for the North Pole,' 'Auroral Observations, Franz-Joseph Land,' 'Meteorological Reports of the North Greenland Expedition' (1893–4), and meteorological publications in government reports.

Bald'win, Frank D., American military officer: b. Michigan, 26 June 1842. He entered the volunteer army in 1861 and the regular army in 1866; became colonel of the 4th United

States Infantry, 26 July 1901; and was promoted brigadier-general, United States army, 9 June 1902. He was awarded a Congressional medal of honor for service at the battle of Pine Tree Creek, Ga., 20 July 1864, and another for gallantry in an action against Indians in Texas. He greatly distinguished himself in the Philippines in the early part of 1902.

Bald'win, Henry, American jurist and author: b. New Haven, Conn., 14 Jan. 1780; d. Philadelphia, Pa., 21 April 1844. A graduate from Yale College in 1797, he studied law, became a barrister, and settled in Pittsburg, Pa. In 1817, and twice subsequently, he was elected a Federal member of Congress. He was appointed justice of the United States Supreme Court in 1830, and in the same year received the degree of LL.D. from his *alma mater*. He wrote 'A General View of the Origin and Nature of the United States' (1837).

Baldwin, Henry Porter, American politician: b. Coventry, R. I., 22 Feb. 1814; d. Detroit, Mich., 31 Dec. 1892. He went to Michigan in his youth and from 1869 to 1873 was governor of the State. From 1879 to 1881 he sat in the United States Senate. He was very prominent in the affairs of the Episcopal Church in Michigan.

Baldwin, James, American author: b. Hamilton County, Ind., 15 Dec. 1841. Very largely self-taught, he was engaged in teaching from 1865 to 1887. He filled an editorial position with Harper & Bros. 1887–93, when he became editor of school books for the American Book Co. He has written: 'Story of Siegfried' (1882); 'Story of Roland' (1883); 'Six Centuries of English Poetry' (1892); 'Old Greek Stories' (1895), etc.

Baldwin, James Mark, American psychologist: b. Columbia, S. C., 12 Jan. 1861. He was educated at Princeton College, Leipsic, Berlin, and Tübingen universities; was instructor of German and French at Princeton 1886–87; professor of philosophy in Lake Forest University 1887–89, and in the University of Toronto 1889–93; and professor of psychology at Princeton University since 1893. He was vice-president of the International Congress of Psychology at London 1892; honorary president of the International Congress of Criminal Anthropology at Geneva 1896; president of the American Psychological Association 1897–98; judge of award at the World's Columbian Exposition 1893; was awarded a gold medal by the Royal Academy of Arts and Sciences of Denmark, in 1897, for the best work on the general question of social ethics; and was elected a member of the Institut International de Sociologie 1898. He is author of 'Handbook of Psychology' (2 vols., 1889–91); a translation of Ribot's 'German Psychology of To-day' (1886); 'Elements of Psychology' (1893); 'Social and Ethical Interpretations in Mental Development' (1897), etc. He was also one of the founders of the 'Psychological Review,' editor-in-chief of the 'Dictionary of Philosophy and Psychology,' and a contributor of articles on psychology to 'Johnson's Universal Cyclopædia' (1892–95).

Baldwin, John Denison, American journalist, politician, poet, and writer on archæology: b. North Stonington, Conn., 28 Sept. 1809; d. 8 July 1883. After studying law and theology he entered journalism, was long editor and proprietor of the Worcester *Spy*, and was a member of Congress 1863–69. He wrote 'Raymond Hill, and Other Poems' (1847); 'Prehistoric Nations' (1869), and 'Ancient America' (1872).

Baldwin, Joseph G., American jurist: b. Sumter, Ala. 1815; d. 30 Sept. 1864. He was a judge of the superior court of California in 1857–63; chief justice of the State from 1863 till his death, and author of 'Party Leaders' and 'Flush Times in Alabama and Mississippi.'

Baldwin, Maurice Scollard, Canadian clergyman: b. Toronto, 21 June 1836. He was graduated at Trinity College in that city 1862; became rector of St. Luke's Church in Montreal; was dean of Montreal 1882–83; and in the last year was made Bishop of Huron. He published 'Break in the Ocean Cable' 'Life in a Look,' etc.

Baldwin, Robert, Canadian statesman: b. Toronto, 12 May 1804; d. there, 9 Dec. 1858. He began to practise law in 1825, and four years later became a member of the Assembly of Upper Canada. He was solicitor-general in 1840 and premier and attorney-general of Upper Canada 1842–43. He was long prominent as a Reform leader in Canada, but retired from office in 1851.

Baldwin, Simeon Eben, American jurist: b. New Haven, Conn., 5 Feb. 1840. He is a great-grandson of Roger Sherman, a signer of the Declaration of Independence, and great-great-grandson of President Clap, of Yale. His father was a United States senator and governor of Connecticut. Judge Baldwin graduated from Yale 1861, and from the Harvard Law School 1863. Settling in New Haven he rapidly acquired a large general practice, in which he continued until 1893. Since 1872 he has held a professorship in the Yale Law School, and since 1893 he has been an associate justice of the Connecticut supreme court of errors. As a legal writer he has a wide reputation in the United States and abroad, through his contributions to leading law journals. He is the author of 'Digest of Connecticut Reports' (2 vols. 1871–82; revision, 2 vols. 1900); 'Illustrated Cases on Railroad Law'; and 'Modern Political Institutions' (1899).

Baldwin, Stephen Livingston, American missionary: b. 1835; d. 1902. He went to China as a missionary under the auspices of the Methodist Episcopal Church, and on his return to the United States he held several pastorates. While in China he translated a large part of the Bible into Chinese, and, it is said, printed the first copy of the Bible in that language.

Baldwin, Theodore A., American military officer: b. New Jersey, 21 Dec. 1839. He entered the army as a private 3 May 1862, and served in that grade and as quartermaster-sergeant in the 19th U. S. Infantry till 31 May 1865, when he became first lieutenant. He was promoted captain 23 July 1867; major, 7th Cavalry, 5 Oct. 1887; lieutenant-colonel, 10th Cavalry, 11 Dec. 1896; and colonel, 7th Cavalry, 6 May 1899. From 6 Oct. 1898 till 31 Jan. 1899 he served as a brigadier-general of volunteers.

Baldwin, Thomas, Baptist minister: b. Norwich, Conn., 23 Dec. 1753; d. 29 Aug. 1825. His early culture was very limited; yet he acquired a reputation for scholarship. At an

early age he removed to Canaan, N. H., where, becoming converted, he joined the Baptist Church in 1781 and became one of the most energetic supporters of its tenets, and one of the ablest advocates of its civil rights. In 1782 he was licensed to preach, and in 1783 was ordained pastor of the church in Canaan, serving for seven years. In 1790 he was called to the Second Baptist Church of Boston and served there till his death. He took a prominent part in the establishment of Waterville College, Me., and of Columbian College, Washington, D. C. He was several times elected to the State legislature and was a member of the convention of 1821 to revise the Massachusetts Constitution. He published a volume in defense of Baptist tenets.

Baldwin, William Henry, American capitalist and philanthropist: b. Boston, Mass., 5 Feb. 1863; d. Locust Valley, L. I., 2 Jan. 1905. He was graduated at Harvard College in 1885, and studied for a year at the Harvard Law School. He then entered the Omaha auditor's office of the Union Pacific Railway as a clerk; in less than a year he was promoted general traffic manager at Omaha; in 1888 he became assistant general freight agent for the Union Pacific; in 1889–90 he was president of the Montana Union Railroad; and in 1890 was elected assistant vice-president of the Union Pacific. In 1891 he entered the service of the Flint & Pere Marquette Railroad as general manager; and in 1894 became third vice-president of the Southern Railway, and in 1895 second vice-president and general traffic manager of the same road. In 1896 he was chosen president of the Long Island Railroad; his administration was particularly efficient and marked by a rapid growth of the road, and the completion of a number of improvements. He was actively interested in reform movements in New York city, and served as chairman of the Committee of Fifteen appointed in 1900; and was also a leader in the Southern educational movement, being president of the General Education Board, a member of the Southern Education Board, and a trustee of Tuskegee Institute.

Bale, John, an English ecclesiastic: b. Suffolk, 1495. Although educated a Roman Catholic, he became a Protestant, and had to take refuge in the Netherlands. On the accession of Edward VI. he returned to England, was presented to the living of Bishop's Stoke, Southampton, and soon after was nominated Bishop of Ossory, in Ireland. Here, on preaching the reformed religion, popular fury reached such a pitch that in one tumult five of his domestics were murdered in his presence. On the accession of Mary he lay some time concealed in Dublin. After enduring many hardships he was enabled to reach Switzerland, where he remained till the death of Mary. On his return to England he contented himself with the calm enjoyment of a prebendal stall at Canterbury, where he closed his stormy life in 1563. He was so bitter a controversialist that he earned the title of «Bilious Bale.» The only work which has given him distinction among authors is his 'Scriptorum Illustrium Majoris Britaniæ Catalogus'; or 'An Account of the Lives of Eminent Writers of Britain.' This account, which, according to the title, commences with Japhet the son of Noah, reaches to the year 1557, at which time the author was an exile on the Continent. It is compiled from various writers, but chiefly from the antiquary Leland.

Bâle, bäl. See Basel.

Balearic (băl-ē-ăr'ĭk) **Crane.** See Crane.

Bal'earic Islands, a group of five islands, southeast of Spain, including Majorca, Minorca, Iviza, and Formentera. The popular derivation of the ancient name Baleares (Greek *ballein,* to throw), has reference to the repute of the inhabitants for their skill in slinging, in which they distinguished themselves both in the army of Hannibal and under the Romans, by whom the islands were annexed in 123 B.C. After being taken by the Vandals under Genseric, and in the 8th century by the Moors, they were taken by James I., king of Aragon, 1220–34, and constituted a kingdom which in 1375 was united to Spain. The islands now form a Spanish province, with an area of 1,860 square miles. Pop. (1897) 306,926.

Baléchou, bä-lā-shoo, **Jean Jacques Nicolas,** celebrated French engraver: b. Arles, 1715; d. Avignon, 18 Aug. 1765. His full-length portrait of Augustus, king of Poland, has been proclaimed the masterpiece of the kind in the 18th century. But Baléchou dishonestly sold the best proofs for his own benefit, and was consequently expelled from the Academy of Fine Arts.

Baleen'. See Whalebone.

Baleen Whales, the group of whales whose mouths are furnished with a growth of baleen or whalebone (q.v.). They form a sub-order *Mysticeti* of the *Cetacea,* which includes the families *Balænopteridæ* or rorquals, and *Balænidæ,* the right whales. These whales are known in all oceans and form an important object of the chase. See Humpback; Right Whale; Rorqual; Whale; etc.

Bal'er, Philippines, a town in the northeast part of Luzon. The population is several thousand, mostly natives. The most conspicuous edifice is a native Catholic church. The town is noted for the heroic defense of a Spanish garrison in 1899, during a siege by the Filipinos, lasting 11 months. The Spaniards were commanded by Lieut. Saturnino Martin Cerezo, who refused to surrender the town, even when directed to do so by his superiors in Manila. He entrenched himself in the church and heroically resisted the besiegers until his supplies gave out, when he surrendered with all the honors of war, 2 July 1899. Baker was occupied by the American troops and garrisoned with two companies of the 34th Volunteer Infantry, under Major Shunk, in March 1900.

Balestier, băl-ĕs-tēr', **Charles Wolcott,** American novelist: b. Rochester, N. Y., 13 Dec. 1861; d. 6 Dec. 1891. He studied at Cornell University, and became connected with a New York publishing house. His writings, which deal largely with frontier life in Colorado, include 'The Naulahka,' written in collaboration with Rudyard Kipling, his brother-in-law; 'Benefits Forgot' (1892), and a 'Life of James G. Blaine.'

Balestra, bą-lĕs'trą, **Antonio,** an Italian painter: b. Verona, 1666; d. there, 21 April 1740. He became a pupil of Belucci, in Venice, and subsequently studied in Rome under Carlo Maratti. He executed the 'Defeat of the Giants,' which took the prize at the Academy of St. Luke in 1694. In 1695 he left Rome for Venice, where he became the head of a school, and counted many distinguished names among his pupils. His works are found in many of the galleries and churches of northern Italy. Among his paintings are 'Saint Theresa,' at Bergamo, a 'Virgin,' at Mantua; and a portrait of himself, at Florence. He was among the last of the Venetian school of artists.

Balfe, bălf, **Michael William,** British composer: b. Dublin, 15 May 1808; d. 20 Oct. 1870. He received his first instructions in music from his father and Charles Horn. In his 7th year he performed one of Viotti's concertos before the public; at 16 he performed the part of the Wicked Huntsman in 'Der Freischütz' at Drury Lane. In 1825 he went to Italy, wrote the music for a ballet, 'La Peyrouse,' for the Scala at Naples, and in the following year fulfilled an engagement to sing at the Théâtre-Italien, Paris, with moderate success. He returned to Italy, and at Palermo (1830) his first opera, 'I Rivali,' was produced. For five years, with somewhat careless haste, he continued singing and composing sundry operas for the Italian stage, which are now forgotten. In 1835 he came to England and had his 'Siege of Rochelle' brought out at Drury Lane. It hit the popular taste, and was quickly followed by others equally successful in this respect. Part of this success was no doubt due to the great artistes who took the leading characters, Malibran, Grisi, Lablache, Rubini, and other stars of that time; but the works had high merits of their own, being marked by brilliancy, melody, and fertility of invention. In 1846 he was appointed conductor of the London Italian Opera. If Balfe was wanting in depth and dramatic force, he had a very thorough knowledge of effects and command of orchestral resources; and his compositions are distinguished by fluency, facility, and melodic power. His operas continue popular in England and elsewhere, among the chief being 'The Bohemian Girl' (the most popular of all), 'The Rose of Castile'; 'The Daughter of St. Mark'; and 'Satanella.' His posthumous opera, 'The Talisman,' was brought out in London in June 1874, with great success.

Balfour, băl'foor, or băl'fêr, **Alexander,** Scottish novelist and poet: b. Monikie, 1 March 1767; d. 12 Sept. 1829. He was a frequent contributor to periodicals, and was author of 'Campbell; or the Scottish Probationer' (1819); 'Contemplations, and Other Poems' (1820); 'Farmer's Three Daughters' (1822); 'The Foundling of Glenthorn; or the Smuggler's Cave' (1823); 'Highland Mary' (1827), etc.

Balfour, Sir Andrew, Scottish botanist and physician: b. Fifeshire, 1630; d. 1694. After completing his studies at St. Andrews and London, and traveling on the Continent, he settled at Edinburgh, where he planned, with Sir Robert Sibbald, the Royal College of Physicians, and was elected its first president. Shortly before his death he laid the foundation of a hospital in Edinburgh, which, though at first narrow and confined, expanded into the Royal Infirmary. His familiar 'Letters' were published in 1700.

Balfour, Right Hon. Arthur James, English statesman: b. Scotland (son of Mr. Balfour of Whittinghame, Haddingtonshire, and a daughter of the second Marquis of Salisbury) 25 July 1848. He was educated at Eton and Trinity College, Cambridge, where he took his M.A. degree in 1873. He entered Parliament in 1874, sitting for Hertford from that time till 1885, since which he has represented East Manchester. He acted as private secretary to his uncle the Marquis of Salisbury at the Foreign Office during the period to which the Berlin Treaty belongs (1878–80), and accompanied him to Berlin. He was president of the Local Government Board from June 1885 till the beginning of the following year, and from July 1886 till March 1887 he discharged the duties of secretary for Scotland. He showed much ability as chief secretary for Ireland 1887–91, passing the Crimes Act and the Law Act, securing a free grant for railways, and creating the Congested Districts Board, but resigned this post in order to succeed Mr. W. H. Smith, who had lately died, as leader of the House of Commons and first lord of the treasury. On the defeat of the Unionist party at the general election in 1892 he relinquished this office, but returned to it when the Unionists again came into power in the autumn of 1895. On the resignation of Lord Salisbury 12 July 1902 Mr. Balfour became prime minister, but resigned with his Cabinet on 4 Dec. 1905. He was returned to Parliament from London on 27 Feb. 1906, by a majority of 11,340. In 1886 he was elected lord rector of St. Andrew's University, in 1890 the Glasgow students did him similar honor and in 1888 he became a Fellow of the Royal Society. He acted as chairman of the commission on the subject of bimetallism in 1887. In 1879 he published 'A Defense of Philosophic Doubt'; in 1893 a volume of 'Essays and Addresses'; and in 1895 'The Foundations of Belief, being Notes Introductory to the Study of Theology.'

Bal'four, Francis Maitland, embryologist: brother of the foregoing, b. 1851. He studied at Harrow and Trinity College, Cambridge. Articles on his special study gained him a high reputation while still an undergraduate, and after further work at Naples he published in 1874, in conjunction with Dr. M. Foster, 'Elements of Embryology, a valuable contribution to the literature of biology. He was elected a fellow of his college; fellow and member of council of the Royal Society; lecturer on, and finally, in 1882, professor of, animal morphology at Cambridge, a chair specially instituted for him. The promise of his chief work, 'Comparative Embryology' (1880–1) was unfulfilled, as 19 July 1882 he was killed by a fall on Mont Blanc.

Balfour, Right Hon. Gerald William, English statesman: b. 1853 (brother to the two preceding). He was educated at Eton and Trinity College, Cambridge, entered Parliament in 1885, and was chief secretary for Ireland in the Unionist ministry from 1895–1900; and President of the Board of Trade, 1900–1905. He piloted the Irish Local Government Bill of 1898 through the House of Commons.

ARTHUR J. BALFOUR.

Balfour, Isaac Bayley, Scottish botanist: b. Edinburgh, 31 March 1853. He was professor of botany in the University of Glasgow 1879–84, at Oxford University 1884–88, and since 1888 at the University of Edinburgh. He explored the island of Socotra in 1880, in behalf of the British Association and of the Royal Society of Edinburgh. He is King's botanist in Scotland and keeper of the Royal Botanic Garden in Edinburgh.

Balfour, Sir James, Scottish lawyer, and a conspicuous actor in the civil wars which ended in the dethronement of Mary, Queen of Scots: b. Fifeshire, Scotland, about the beginning of the 16th century; d. 1583. Originally brought up in the Roman Catholic Church, he had espoused the Protestant cause, and in 1547, for his share in the conspiracy against Cardinal Beaton, he was, with Knox and other reformers condemned to the galleys. After his escape and return to Scotland, the cause of Protestantism was apparently declining, and Balfour abjured his heresies and returned to his former faith. His abilities and tact gained him appointments and he was high in office on the arrival of Mary in Scotland, and was with the queen at Holyrood on the night of Rizzio's assassination. Popular rumor assigned to Balfour a prominent share in the murder of Lord Darnley, Mary's husband, but he contrived to outlive all suspicion. In 1567 he was appointed captain of Edinburgh castle. A change in Balfour's convictions was forced upon him, for he saw that a powerful party had been formed against Mary and the policy of an alliance with them overcame all scruples. He held the castle of Edinburgh against the queen, and was the means of delivering up Mary's letters into the hands of her enemies. He afterward surrendered the castle for various considerations. On the breaking out of the civil war Balfour sided with the regent Murray, but after Mary's imprisonment in England he took part in conspiracies for her restoration, although at the time professing adherence to the regents Murray and Morton. His last public act was furnishing the evidence of Morton's guilt in the murder of Darnley, for which Morton was condemned and executed. The 'Practicks of Scots Law' attributed to him, continued to be used and consulted in manuscript for nearly a century until it was supplanted by the 'Institutes of Lord Stair.'

Balfour, James, Canadian architect: b. Hamilton, Ont., 1852. He acquired his education in Canada and Edinburgh and began the practice of his profession in his native city. Among notable buildings of his designing are the Boys' Home and City Hall, in Hamilton; Alma Ladies' College, St. Thomas; and the Museum of Art, Detroit, Mich.

Balfour, John (OF KINLOCK, or OF BURLEY), one of the chief actors in the assassination of Archbishop Sharp in 1679, for which his estate was forfeited and a price set on his head. He fought at Drumclog and Bothwell Bridge, and is said afterward to have escaped to Holland. According to one account he died on a homeward voyage to Scotland; by another he never left the country, but settled in the parish of Roseneath, Dumbartonshire. He is described by Scott in 'Old Mortality.' Balfour of Kinlock is quite a different personage from Lord Balfour of Burleigh, who succeeded to the title in 1663, spent his youth in France, and died in 1688.

Balfour, John Hutton, Scotch botanist: b. Edinburgh, 15 Sept. 1808; d. 11 Feb. 1884. He graduated at Edinburgh University in arts and in medicine; in 1841–5 was professor of botany in Glasgow University; and in the latter year removed to Edinburgh to occupy a similar post, resigning his chair in 1879. He wrote valuable botanical text-books, including 'Elements,' 'Outlines,' 'Manual,' and 'Class-book,' beside various other works.

Balfour, Nesbit, British military officer: b. Dunbog, Scotland, 1743; d. same place, October 1823. He was promoted lieutenant-general 1798 and general 1803; distinguished himself during the American Revolution; was wounded in the battle of Bunker Hill; fought at the battles of Elizabethtown, Brandywine, Germantown, and Long Island; and was present at the capture of New York. He was appointed commandant at Charlestown in 1779.

Balfrush, băl-frōōsh', or **Barfurush** ("mart of burdens"), a town in the Persian province of Mazanderan, on the river Bhawal, 12 miles from the Caspian Sea. Balfrush is a centre of trade between Russia and Persia, exporting large quantities of silk, rice, and cotton, while the Russians supply iron and naphtha. It has excellent bazaars, numerous caravanserais, and several Mohammedan colleges. Pop. about 50,000.

Balg, bălg, **Gerhard Hubert,** philologist: b. Scandinavia, about 1850. He graduated at the University of Wisconsin, and resides at Mayville, in that State. He has translated W. Braune's 'Gothic Grammar, with Selections and Glossary' (1883); edited 'The First Germanic Bible, and Other Remains of the Gothic Language with Introduction and Glossary' (1891); and compiled 'A Comparative Glossary of the Gothic Language, with Especial Reference to English and German' (1887–9).

Bali, bä'lē, or **Bally,** an island of the Indian Archipelago, belonging to Holland, and lying east of Java. Its greatest length is 85 miles; breadth, 55 miles; area, about 2,260 square miles. It consists chiefly of a series of volcanic mountains, of which the loftiest, Agoong (11,326 feet), became active in 1843 after a long period of quiescence. Principal products, rice, cocoa, coffee, indigo, cotton, etc. The people are akin to those of Java and are mostly Brahmins in religion. It is divided into eight provinces under native rajahs, and forms one colony with Lombok, the united population being estimated, in 1897, at 1,044,757.

Balikesri, bä-lē-kĕs'rē, **Balu-kissar,** or **Balik-Shehr,** a town of Anatolia, 75 miles southwest from Brusa. It is built of unburnt bricks and contains the tomb of a celebrated Mohammedan saint and a manufactory of felt cloth for military clothing. It has considerable trade in silk fabrics. Pop. over 12,000.

Ba'liling, a principality of the island of Bali; pop. 130,000. The exports are rice and bullocks, and the chief trade is with the Bughis of Celebes. In 1847 the Dutch were signally defeated in an attack upon the fort of Djaga Raga in this principality.

Balinag, bä-lē-näg′, Philippines, a town of the province of Bulacan, Luzon. Pop. (1898) 14,122.

Baliol, bā′lĭ-ŏl, **Edward,** a king of Scotland, son of John Baliol of Scotland; d. Doncaster, 1363. In 1322 he made a successful invasion of Scotland and on 24 September of that year was crowned king of Scotland at Scone. Having privately rendered homage to Edward III. of England, he was routed by a party of Scottish nobles and dispossessed of his crown after a reign of three months. He regained it the next year, but was henceforth an instrument of Edward.

Baliol, or **Balliol, John,** king of Scotland: b. about 1249; d. 1315. On the death of Princess Margaret of Norway, grandchild of Alexander III., in 1290, Baliol claimed the vacant throne by virtue of his descent from David, Earl of Huntington, brother to William the Lion, king of Scotland. Robert Bruce (grandfather of the king) opposed Baliol; but Edward I.'s decision was in favor of Baliol, who did homage to him for the kingdom, 20 Nov. 1292. Irritated by Edward's harsh exercise of authority, Baliol concluded a treaty with France, then at war with England; but, after the defeat at Dunbar, he surrendered his crown into the hands of the English monarch. He was sent with his son to the Tower, but, by the intercession of the Pope in 1297, obtained liberty to retire to his Norman estates, where he died.

Baliol, or **Balliol, John,** father of King John Baliol, an English baron in the reign of Henry III.: d. 1269. In 1263 he laid the foundation of Balliol College (q.v.), Oxford, which was completed by his widow, Devorguila or Devorgilla. She was daughter and co-heiress of Allan of Galloway, a great baron of Scotland, by Margaret, eldest daughter of David, Earl of Huntington, brother of William the Lion. It was on the strength of this genealogy that his son, John Baliol, became temporary king of Scotland.

Baliol, Martha Bethune, the imaginary narrator of several of Sir Walter Scott's 'Chronicles of the Canongate.'

Baliol College. See BALLIOL COLLEGE.

Balisarda, bä-lē-sär′dą, a magic sword in Ariosto's 'Orlando Furioso,' stolen from Orlando by Brunello, and afterward given to Rogero.

Balisaur, băl-ĭ-sä′oor (Hindu, *balloosoor*), the sand-badger of India, called by Hindus the pig-like badger or "sand-hog," on account of its long snout. See SAND-BADGER.

Balis'ta, or **Ballista,** a machine used in military operations by the ancients for hurling heavy missiles, thus serving in some degree the purpose of the modern cannon. The motive power appears to have been obtained by the torsion of ropes, fibres, catgut, or hair. They are said to have sometimes had an effective range of a quarter of a mile, and to have thrown stones weighing as much as 300 pounds. *Balistæ* differed from *catapultæ*, in that the latter were used for throwing darts.

Balize, bą-lēz′. See BELIZE.

Balkan băl-kän′, or bäl′kăn, **Mountains,** (anciently called *Hæmus*), a lofty and rugged mountain range, extending from Cape Emineh Burum on the Black Sea, in eastern Roumelia, in a westerly direction to the borders of Servia, and forming the southern boundary of the basin of the Danube. In the west it is connected with the much ramified mountain-system of the southeastern peninsula of Europe. Its length is over 200 miles; the average elevation is about 3,000 feet, but the group of the Khoja Balkans in the west have a mean height of 6,500 feet. The highest summit is Jumrukchal, 7,786 feet. The Balkan forms the watershed between the streams flowing northward into the Danube, and those flowing southward to the Ægean. The chief of the latter is the Maritza. The range, which has a gradual descent on the north, presents on the south a somewhat steep escarpment, and has always been considered the greatest natural bulwark of the Ottoman empire against enemies on the European frontiers. Yet in the Russo-Turkish war of 1877–8 the Russian troops managed to cross it without any great difficulty, although they had to encounter a stubborn resistance at Shipka Pass (4,370 feet). Here a Turkish army of 32,000 men surrendered to the Russians. The range now forms the southern frontier of Bulgaria, dividing it from eastern Rumelia. The whole of the southeastern peninsula of Europe is known as the Balkan Peninsula.

Balkan Peninsula, a region thus named after the Balkan (Turkish "high ridge"), the ancient Hæmus (Greek ὁ Αἷμος) an important mountain range in southeastern Europe. It is the southeasternmost of the three great southern peninsulas of Europe, each of which is named after the central mountain system forming its backbone; namely, the Tyrenean, the Apennine, and the Balkan peninsulas. The northern boundary of the latter is not as clearly defined as that of the other two great peninsulas separated from central Europe by the gigantic mountain barriers of the Pyrenees and the Alps. Assuming that rivers also form a natural boundary, the Balkan Peninsula ends on the right bank of the Danube and her tributaries, the Save and the Una; it is bounded on the west by the Adriatic and the Ionian seas, on the east by the Black or Euxine and the Ægean. In a broader designation, however, the northern boundary is assumed to be the parallel of 45° N., adding to the peninsula more than one half of Rumania (Wallachia and Dobrudja) and a part of Austria (Dalmatia and a section of Croatia). Excluding the territory between 45° N. and the Danube, the peninsula comprises an area of about 175,000 square miles, which contains European Turkey proper with Novibazar, a Turkish district under Austrian military control. Bosnia, and Herzegovina (temporarily occupied by Austria; Montenegro, Servia, Bulgaria, an autonomous and tributary principality, with eastern Rumelia, under the suzerainty of Turkey and Greece. No other country in Europe is so richly provided with gulfs and excellent harbors of commercial and naval strategic value. An archipelago of numberless islands, the Cyclades and Sporades of ancient fame, forms a continuous bridge between the Balkan Peninsula and Asia Minor. The Black Sea is connected with the Sea of Marmora through the Bosporus,

a channel about 20 miles long, and so narrow that Constantinople, at the southwest extremity of the Thracian Bosporus, is but one mile distant from the Asiatic city of Scutari, eastward across the Bosporus. The Sea of Marmora is linked with the Ægean by the Dardanelles with an average width between three and four miles. The Balkan Mountains, a continuation of the Carpathian Mountain system, extend in a varied formation from the Adriatic to the Euxine, breaking up in their advance eastward into several parallel chains with many more or less, strong spurs north and south; several ranges extend southward almost to the Ægean: the Perim Dagh and the ancient Rhodope Mountains or Despoto Dagh. They are frequently broken by defiles or passes of a different degrees of serviceableness as routes. The principal passes are the Nadir-Derbend, Karnabad, the Basardshik-Sophia, the Trajan, Rosalitha, and Shipka, the latter famed by the heroic struggles between the Russians and Turks in 1877. The principal range of the Balkans is thus divided into several sections, like the Etropol, Kodja, and Shipka Balkans, and forms the boundary between Bulgaria and Rumelia. The main elevation of the chain is from 4,000 to 5,000 feet, but it rises much higher in various parts, the loftiest elevation of 9,700 feet above sea-level being reached by Mount Scargus in the Char Dagh. The Balkans are rich in minerals, especially rock salt, lead, iron-ore, copper, silver, but the treasures of the soil are yet very imperfectly known in spite of the geological researches, undertaken by German, French, and other travelers and scientists. The mountains are mostly of a granite formation, but the mountain system is very complicated, and its geologic and geostratic connections are hard to determine. There are numerous thermal and sulphurous springs, some of which are renowned and utilized as sanitary watering places. The mountains form the watershed separating the tributaries of the lower Danube and those of the Vardar and Maritza rivers, or, in other words, the watershed between the Black Sea and the Ægean. On account of the broken and irregular character of the peninsula the rivers are short and little navigable. The westernmost section of Turkey, Albania, separated from Montenegro and Novibazar by the North Albanian Alps, is a mass of parallel mountain ranges, irregularly traversed by the winding rivers, Boyana, Drin, Loum, Voiutza, and Arta, which flow into the Adriatic and Ionian seas. In the Turkish provinces of Scutari, Monastir, and Saloniki, there are a number of large and deep lakes, pre-eminently those of Scutari, Ochrida, Janina, Prespa, and Kastoria. The climate of the peninsula is exceedingly varied; it is rigorous with heavy snowfalls in the north and in the central plateau between Serajevo (Bosnia) and Sofia (Bulgaria), and the tableland of Janina, but becomes mild and sunny toward the south and east, tempered by the breezes of the Ægean. There is hardly any country in the world inhabited by such a number of different peoples as the Balkan Peninsula. Surviving there are all the races recorded at the beginning of history, with their national languages and distinct racial consciousness. They do not form, however, the whole people or even the great majority of their particular race in any one district, but are intermingled and live side by side, without ever blending together, so that the process of disentangling their various and conflicting aspirations, tendencies, and racial as well as religious distinctions, is well-nigh impossible. In eastern Rumelia (ancient Thrace) and Macedonia, there may be found a Greek, a Bulgarian, a Turkish, an Albanian village side by side. The Greeks or Byzantines, the Daco-Rumanians, who speak a distinctly Romance or neo-Latin language, and proudly derive their origin from the legionaries of Emperor Trajanus stationed in Dacia, yet undoubtedly from Dacian or Thracian mothers,—and the Albanians of Illyrian stock are the most ancient historic races of the Balkans. The Slavs are late-comers by migration and conquest. They became neither Greek nor Roman in speech or customs, political character or national proclivities, but remained distinctive in language and racial characteristics. At periods historically well determined, after the Gothic invaders in those regions had been defeated or absorbed or started on their world-stirring career, after the Turanian Avars had lost their overwhelming power, the Slavic tribes moved in great numbers into central and southeastern Europe. About 630 A.D. the Croats began to occupy the present Croatia, Slavonia, northern Bosnia. In 640 the Servians of the same race and language conquered the Avars and peopled Servia, South Bosnia, Dalmatia, Montenegro, whose inhabitants are pure Serbs in blood and language, only deriving their name from their national hero, Ivo the Black (Tsernoi), who gave the name of Tsernogora (Montenegro) to those desert rocks, a safe retreat to the Servians, after their defeat at Kossovo in 1389 inflicted by the Turks. The ethnic situation of to-day dates from that epoch. The origin of the Bulgarians is not quite clear. They appear to be of Finnish-Ugrian stock, and therefore related to the Turks and the Hungarians, but were Slavicized early in history. The great apostles of the Slavs, Methodius and Cyrillus, themselves Bulgarians, even brought Byzantine culture and the Greek-orthodox religion to the other Slavic races on the peninsula. The battle of Kossovo, already mentioned, made an end to the independence of the highly developed Slavic States, and with the fall of Constantinople in 1453, the last bulwark of the crumbling Byzantine empire, the Turkish sway over the entire Balkan Peninsula became a reality. Four centuries of racial strife between the Turkish conquerors and the various Greek, Rumanian, and Slavic races under their sway ended in the formation of the Danube States and the Hellenic kingdom, more or less according to races and nationalities, so far as this was possible at all in the case of peoples which are at least as far removed in sympathy and political aspirations from one another as they are from the Turks. The racial antagonisms are grievously accentuated in the attempted solutions of racial, political, and religious problems.

HERMANN SCHOENFELD,
Columbian University, Washington, D. C.

Balkh, bälkh, a district of Afghan Turkestan. It corresponds to ancient Bactria, and is bounded on the north by the river Oxus, on the east by Badakhshan, on the south by the Hindu Kush, and west by the desert. Its length is 250 miles; its breadth, 120. Its situation was once important during the overland commerce between Indian and eastern Europe before the

sea route by the Cape of Good Hope was followed. The soil has the general characteristics of a desert land; only a few parts are made fertile by artificial irrigation; and such are the vicissitudes of climate that where grapes and apricots ripen in summer, and the mulberry-tree permits the cultivation of silk, in winter the frost is intense and the snow lies deep on the ground. The natives are Uzbegs, whose character differs in different districts.

Balkh, the capital of the district of the same name, situated in a district intersected by canals and ditches. It is surrounded by a mud wall; but though bearing the imposing title of "Mother of Cities," it has not in recent times had any of the grandeur of ancient Bactra, on the site of which it is built. It was twice destroyed by Genghis Khan and Timur. A terrible outbreak of cholera in 1877 caused the capital of Afghanistan Turkestan to be transferred to Mazar, west of Balkh; since which Balkh has been an insignificant village.

Balkhash, bäl-käsh′, a great inland lake, near the eastern border of Russian Central Asia. Lying about 780 feet above sea-level, it extends 323 miles west-southwest; its breadth at the west end is 50 miles; at the east from 9 to 4 miles; the area is 8,400 square miles. The water is clear but intensely salt. Its principal feeder is the river Ili. It has no outlet. The northern edge is well defined; but the south shores of the lake are labyrinths of islands, peninsulas, low sandhills, and strips of shallow water. Here grow masses of enormously tall reeds in which wild swine shelter. To the south, stretching toward the base of the Alatau Mountains, is a vast steppe almost devoid of vegetation. Balkhash seems to have at one time included in its immense area the smaller lakes Sossik-kul and Ala-kul, now far to the southeast.

Bal'kis, the Arabian name of the queen of Sheba who visited Solomon. She is the central figure of innumerable Eastern legends and tales.

Ball, Ephraim, American inventor: b. Greentown, O., 12 Aug. 1812; d. Canton, O., 1 Jan. 1872. He was brought up as a carpenter, but in 1840 he established a foundry for making plow castings; invented a plow, a turn-top stove, the Ohio mower, the World mower and reaper, and the New American harvester; and for many years before his death was president of an extensive manufacturing plant at Canton, Ohio.

Ball, John, English priest of the 14th century. He was a disciple of Wycliffe, upon whose religious doctrines he engrafted some political theories resembling the "liberty, equality, and fraternity" of later ages. He was intimately concerned in the Wat Tyler insurrection of 1381, and for his part in the affair was executed at St. Albans, 15 July 1381. See Morris, 'The Dream of John Ball.'

Ball, Sir Robert Stawell, distinguished English astronomer: b. Dublin, 1 July 1840. In 1865 he was appointed Lord Rosse's astronomer at Parsonstown. He has held many posts in connection with astronomy and mathematics, including those of professor of applied mathematics and mechanism at the Royal College of Science for Ireland; Andrews professor of astronomy in the University of Dublin; astronomer-royal of Ireland; and Lowdean professor of astronomy and geometry in the University of Cambridge, and director of the Cambridge observatory since 1892. The Royal Society elected him a Fellow in 1873, and in 1886 he was knighted. His numerous works include: 'The Story of the Heavens' (1885); 'Time and Tide' (1889); 'Star-Land' (1889); 'The Story of the Sun' (1893); 'Great Astronomers' (1895); 'A Treatise on the Theory of Screws' (1900); 'The Earth's Beginning' (1901); 'Popular Guide to the Heavens' (1905); etc.

Ball, Thomas, American sculptor: b. Charlestown, Mass., 3 June 1819. He studied in Italy; engaged in painting, 1840-52; adopted sculpture exclusively in 1851; resided in Florence, Italy, 1865-97; and afterward in Montclair, N. J. His best-known works are the equestrian statue of Washington in Boston; the Webster statue in Central Park, New York; and 'Emancipation' in Washington, D. C. He published 'My Threescore Years and Ten, an Autobiography' (1891).

Ball, as an article of ammunition, see Gunnery; Ordnance; Projectiles; Shot.

In connection with sports and games the ball in various sizes has been in universal usage since ancient times. The Greeks regarded ball-games as of much value in adding grace to the figure and giving elasticity to the muscles of the body, and the Romans also played a game of ball in connection with their baths for the same purpose. Several of the games then played resembled modern handball, football, and polo. Modern tennis and rackets undoubtedly had their beginnings in the *jeu-de-paume* of the Middle Ages, and lacrosse was originally played by the North American Indians, though the historical data concerning these and other games are meagre and new customs and rules have so changed games that their true history cannot be told with exactness. Of varieties of balls for use in the different sports there are many. The baseball is made of a sphere of rubber, 2½ ounces in weight, which is wound with yarn and covered with leather. The basket-ball is an inflated rubber ball, enclosed in leather and from 30 to 32 inches in diameter. The tennis ball is of rubber covered with white flannel, about 2½ inches in diameter and 2 ounces in weight. The lacrosse ball is made of india-rubber and is 8 or 9 inches in diameter. The polo ball is of wood and 4 or 5 inches in diameter. The football is a prolate spheroid in shape and consists of a rubber bladder encased in a leather cover. Billiard balls are of ivory and from $2\frac{5}{16}$ to $2\frac{7}{16}$ inches in size. See Baseball; Football; Basket-ball; Lawn Tennis; Rackets; Cricket; Handball; Lacrosse; Polo; Billiards; etc.

Ball and Socket, a joint used in machinery and piping. It consists of a spherical end of a rod or pipe fitting into a hollow sphere of the same size on a like piece. The object of this joint is to provide a close, movable connection, and to prevent leakage in pipes.

Ball Bearing, a mechanical bearing, consisting of a cup against the inner circumference of which steel balls are placed. A cone fitted to the steel bears against these balls. It is used

to a great extent in bicycles and light carriage wheels, and to a less extent in light machinery and wagon bearings. Its object is to reduce friction and the use of lubricants.

Ball Clay. See CLAY.

Ball Cock, a self-acting stop-cock, opened and shut by means of a hollow metallic sphere attached to the end of a lever connected with the cock. Its use is principally to regulate the supply of water to cisterns. The ball floats by reason of its buoyancy, and rising and sinking as the water rises and sinks, shuts off the water in the one case and lets it on in the other.

Ball Flower, an architectural ornament resembling a ball placed in a circular flower, the three petals of which form a cup around it; usually inserted in a hollow molding, and generally characteristic of the Decorated Gothic style of the 14th century.

Ball Nozzle. See HYDRODYNAMICS.

Ballad, a short narrative poem in stanzas, originally intended for singing. The name, which is derived from the Latin *ballare,* to dance, is frequently used very loosely, and applied to a variety of songs and verse-tales with no real bond of association. But in the stricter sense it belongs to a comparatively small body of anonymous traditional poetry, the production of which has practically ceased in English-speaking countries, though literary imitations of the type are still composed. Its most characteristic quality is impersonality. Not only is the author unknown, but in the pure ballad there is no trace of his individuality. The material of the poem is usually popular in origin, and the sentiment and point of view are those, not of a single person, but of the whole people. "People," in the sense here used, has reference not to the lower classes but to society in a period when in the matter of culture the community was homogeneous. Thus the origins of the kind of poetry of which the ballad is a survival are to be looked for in a comparatively primitive stage of society, before the "poetry of art" came into existence, when the tribal community could still express itself in simultaneous utterances accompanying the rhythmic movements of dance or march.

This view of the origin of ballad poetry is not universally accepted. Over against it there is placed the apparently simpler theory that the ballads are the production of minstrels, from the fifteenth century down, who derived from romances and other sources in artificial literature stories which they threw into crude stanzas, to chant sometimes in the houses of the great, sometimes at fairs and other popular gatherings. But the objections to this view are serious. First, minstrel ballads such as are here described were manufactured and still exist in abundant broadsides and chap-books, but they are universally lacking in precisely those qualities of impersonality and unconsciousness which constitute at once the mark and the charm of the true popular ballad. Second, the minstrel theory ignores the existence of a large mass of ethnological evidence, showing the indubitable and well-nigh universal existence of the practice of communal song, and the development in this song of a narrative element. Third, it is a matter of definite proof that the genuine ballads which have been collected during the last two centuries have come, with rare exceptions, not from the mouths or wallets of minstrels, but from humble unprofessional people, "the spinsters and the knitters in the sun," who have in so many branches of folk-lore proved the best conservators of the heritage of the people. A minstrel's addition to his stock of an occasional piece of more or less degraded popular verse in no wise overthrows the significance of this fact. There is no reason to believe that, in the centuries before ballad-collecting began, the medium of transmission was substantially different.

The argument on the other side has already been partly indicated. First, there exists the evidence of the wide-spread practice of accompanying communal activity—in labor, ceremonial, or festal dance—with rhythmic utterances; the gradual growth of these utterances in definiteness of form; the practice of making them the medium of narrating some episode known to all—*e. g.,* the story of some great deed accomplished by the hero whose death is being lamented, or the manner of the victory which is being celebrated, or some ludicrous incident in the season's labor happily finished,—the contribution of a new line or stanza now by this, now by that member of the dancing throng; the recurrent refrain sung by all; the final creation of a narrative song for which no one individual is responsible, but which is the expression of the thought and feeling of all. Second, the unindividual element is intensified by the method of transmission. Before any extant ballad came into the form in which we find it, it had been handed down from mouth to mouth through many generations, modified endlessly in detail, but by this very process losing whatever individual elements might at any stage appear in it, and keeping, with whatever change of matter or modernization of dialect, just those qualities of impersonality and unconsciousness of literary effect which have been noted as its characteristic traits. Third, the theory suggested by these facts receives corroboration from the refrain and from the characteristic narrative method of the ballad, the so-called "incremental repetition." The phrase is used to describe the method of telling a story by the repetition in a set of stanzas of the same words with just enough change to advance the narration one step. Thus the motive for the murder of the Bonnie Earl of Murray is gradually insinuated by this method in these stanzas:

He was a braw gallant,
And he rid at the ring;
And the bonny Earl of Murray,
Oh he might have been a king!

He was a braw gallant,
And he played at the ba;
And the bonny Earl of Murray
Was the flower amang them a'.

He was a braw gallant,
And he played at the glove;
And the bonny Earl of Murray,
Oh he was the Queen's love!

A moment's reflection will show how suitable such a device is to communal improvisation, and how naturally it is derived from it. As for the refrain, the part played by the crowd in the singing of it does not need to be argued.

It is not implied that all ballads showing incremental repetition and preserving refrains were thus composed by a throng. For most,

perhaps for all, of our extant ballads it is probably safe to assume a single original author, whose name and circumstances are now hopelessly lost, but who first gave each ballad a definite form. But even when making this assumption, we must bear in mind the fact that he worked after models which went back ultimately to communal products, that he worked in a period when it was still possible to compose in the communal spirit, that he used for the most part popular material, and, finally, that his product has been transmitted orally through generations who altered and modified till whatever of personal existed in the first form has been obliterated. Thus if the famous phrase, «das Volk dichtet,» can not be used of the ballads we read to-day in the sense in which it was true of the earliest communal chants, it still holds to this extent that, in so far as a given specimen approaches the pure ballad type, it fails to exhibit the marks of any handiwork but that of the folk.

The ballad thus stands at the remote end of that line of development at the hither end of which we find the modern subjective lyric such as the sonnet. The curve which lies between shows the tendency running through the history of poetry to have been to emphasize more and more the individuality of the author, to relegate the people more and more to the place of mere audience. We are prepared to find, then, many features in the history of ballads highly dissimilar and even contradictory to those of modern literature. Thus the life of a modern poem begins when it is committed to paper: a ballad then begins to die. It lives only while it is still being transmitted orally from generation to generation, receiving from each its stamp. A modern poem has one authentic text: a ballad may have many texts, varying in number with the extent of territory over which it was sung, but no single authoritative text. A modern poem avoids explicit borrowing: the ballad absorbs and assimilates freely numbers of «commonplaces,»—phrases, lines, and even sets of stanzas that appear with equal appropriateness in half a dozen different ballads, and are the exclusive property of none. Such are the formulas for sending a messenger,

O whaur will I get a bonny boy, etc.;

for ordering a horse,

O saddle me the black, the black,
O saddle me the brown;

for describing a journey,

They hadna' gaen a mile, a mile,
A mile but barely three;

for concluding a romantic tragedy,

The tane was buried in Mary's kirk,
The tither in Mary's quire,
And out of the ane there grew a birk,
And out of the ither a brier, etc.

A modern poet seeks novelty of epithet: the ballad clings to the traditional description; the gold is red, the lady is fair, her dress is grass-green, her hair is yellow, her tears are salt, the moon's light is clear, the porter is proud, brothers are bold, a bower is «bigly,» and so on.

Equally characteristic is the treatment of incident and plot in the ballad. There is seldom any introduction: we plunge at once into the midst of the action. The stanzas leap from peak to peak of the narrative, with no attempt to supply the less important links, yet seldom with any real sacrifice of clearness. The events in the uncontaminated ballad are unmoralized and unsentimentalized; the bald fact is left without comment or criticism from the singer. Conscious figures of speech are rare, and the background is seldom filled in. Thus the general result is that of rapidity of motion, directness and unconsciousness of effect, an absence of artistic suggestion. Whenever we find a moral drawn, or a dwelling on the pathetic, interpolation by a modern would-be artist is to be suspected.

From what has been said of origins, it is clear that little can be guessed as to the date of composition of ballads. Some, notably those simple, highly typical stories like 'The Twa Sisters,' written in a two-line stanza with a refrain, with stress upon situation rather than upon succession of events, may in some form be of almost any age. Others have an upper limit of date fixed by the historical event which occasionally forms the basis of the plot. The dates of ballad manuscripts, which are, of course, an entirely different thing, and a date of death rather than of birth, are more easily fixed. The earliest is 'Judas' (No. 23 in Child's collection) from a 13th century MS.; the next, 'Riddles Wisely Expounded' (Child, 1) about 1445; a little later, 'Robin Hood and the Monk' (Child, 119), 'St. Stephen and Herod' (Child, 22), and 'Robyn and Gandelyn' (Child, 115); two exist in copies of about 1500; two others about 1550. Less than a dozen are preserved in MSS. before 1600. The most important single MS. is the Folio which Bishop Percy used as a basis for his famous «Reliques of Ancient English Poetry,» and it is in a handwriting of about 1650. A few appear in early printed forms. 'A Lytell Geste of Robyn Hode' was printed about 1500, and broadside versions, usually in very degraded form, appeared frequently in the 17th and 18th centuries. The most important sources after the Percy Folio are the collections made directly from the mouths of the people, such as those of David Herd (1776), Mrs. Brown of Falkland (1783-1801), Sir Walter Scott (1783-1830), C. K. Sharpe (*c.* 1823), Motherwell (1825-7), Kinloch (1826), Buchan (1828), MacMath and Child (second half of the 19th century).

Ballads on historical occurrences apart, most of the plots belong to the mass of folk-tale which is the exclusive possession of no one nation or language. Many ballads tell stories versions of which are found in almost every known tongue. The explanation of this world-wide diffusion of story-material is one of the standing problems of folk-lore; but whatever theory of its cause be adopted, the fact that it is largely from this international treasury that the ballads derive their plots, is a strong reason for regarding them as essentially «popular» in matter as well as in manner.

Turning now to the nature of these stories, we find that by far the largest class is concerned with romantic love and its consequences. Many are tragic, the interference of fathers, mothers, or brothers being perhaps the commonest cause of the fatal issue. Both in these and in the romantic ballads with happy endings the sympathy of the audience with the lovers is in general assumed, and in cases of illicit love no moral judgment is passed or suggested. Some of the best are ballads of war by land or sea;

and the irregular warfare of the Borderland between England and Scotland has given birth to a number justly famous. The largest group connected with a single personality is that of the Robin Hood ballads. Of these, some like 'A Lytell Geste' and 'Robin Hood and the Monk' represent not only the finest of the outlaw group, but rank with the best of all ballads. The later members of this group, however, show serious deterioration, and they finally sink into the degradation of broadsides manufactured by printers' hacks. The 'Geste' itself is of especial interest as showing a significant stage in the process by which ballads are combined in the formation of the popular epic. In it four or more distinguishable ballad plots are woven together to form a miniature epic, the interweaving being clearly the work of a conscious artist who at the same time was in full sympathy with the popular spirit. The supernatural also plays an important part in the ballads, and it is possible to gather from them much information as to popular belief on such themes as fairies, witches, the return of the dead, transformation by enchantment, and the like.

The number of extant ballads in English may be gathered from the great final collection of Professor Child. Here, ignoring variants, we have three hundred and five, most of which are popular in the sense which has been defined, *i. e.* they fulfil these conditions, that even if written each by an individual author, that author belonged to the people, drew his material from the common stock of folk-tales, wrote in the popular spirit, and used the traditional method, had his product accepted by the folk and passed on and modified by them through centuries of oral transmission. Some few such as 'The Boy and the Mantle,' 'King Arthur and King Cornwall,' and 'The Marriage of Sir Gawain,' are closely associated with metrical romances, and are usually regarded as written by minstrels for more courtly audiences, but are yet enough in the popular style to justify their inclusion as ballads. More are traditional ballads corrupted for the printing press and represented by broadside versions because no purer form has survived. And in the case of almost every ballad surviving in several versions, some versions show a higher degree of purity from literary editing than others.

The localities from which the ballads have been gathered are widely scattered, versions of several having been picked up in America. But Scotland claims about two-thirds of the whole.

Bibliography.—The completion of F. J. Child's exhaustive 'English and Scottish Popular Ballads' (5 vols., Boston 1882-98), with its bibliographies and full account of the sources, makes unnecessary a list of previous less comprehensive collections. Every known version of every extant ballad in any English dialect was intended to be included by the editor, and little or nothing has escaped him. The introductions give an account of parallels and analogues throughout the world. An abridged collection has been edited by H. C. Sargent and G. L. Kittredge (1 vol., Boston 1904). On the question of origins, consult F. B. Gummere, 'Old English Ballads' (Boston 1894), 'The Beginnings of Poetry' (New York 1904), 'The Popular Ballad' (Boston 1907); T. F. Henderson's edition of Scott's 'Minstrelsy of the Scottish Border' (Edinburgh 1902), and his 'Scottish Vernacular Literature,' chap. xi (London 1898); and vol. i of Courthope's 'History of English Poetry.' An excellent condensed statement of the whole matter by G. L. Kittredge forms the introduction to the one-volume edition of Child's collection.

William A. Neilson,
Professor of English, Harvard University.

Ballade, bą-läd′ the earlier and modern French spelling of «ballad,» but now limited in its use to a distinct verse-form introduced into English literature of late years from the French and chiefly used by writers of *vers de société.* It consists of three stanzas of eight lines each, with an «envoy» or closing stanza of four lines. The rhymes, which are not more than three, follow each other in the stanzas, thus: a, b, a, b; b, c, b, c, and in the envoy, b, c, b, c; and the same line serves as a refrain to each of the stanzas and to the envoy. There are other varieties, but this may be regarded as the strictest, according to the precedent of Villon and Marot.

Ballagi, bŏl′lō-gē, **Maurice,** or **Moritz, Bloch,** a Hungarian philologist and Protestant theological author, most widely known for his grammars and dictionaries of the Hungarian language: b. Inocz, of Jewish parents, 18 March 1815; d. 1 Sept. 1891. He was educated at Budapest and Paris; was converted to Protestantism in 1843; studied theology at Tübingen; and was professor of theology at Szarvas from 1844 to 1848 and from 1851 to 1855, and at Budapest from 1855 to 1878. His first large work was the translation of the Bible into the Hungarian language for the purpose of Magyarizing the Jews, but of this work only the Pentateuch and the Book of Joshua were published (Budapest 1840-43). The most important of his philological works are: 'Ausführliche theoretisch-praktische Grammatik der ungarischen Sprache' (1843; 8th ed. 1881); 'Vollständiges Wörterbuch der ungarischen und deutschen Sprache' (2 vols., 1854-7; 6th ed. 1890); 'Sammlung der magyarischen Sprichwörter' (2 vols., 1850; 2d ed. 1855).

Ballanche, bą-länsh′, **Pierre Simon,** French philosopher: b. Lyons, 4 Aug. 1776; d. 12 June 1847. His great work is the 'Palingénésie Sociale' (1828), in which he seeks to illustrate the workings of God in history and sketch how human society may and will be reconstructed so as to attain its highest development. His works are a strange mixture of mysticism, socialism, and the philosophy of history. His 'Vision d'Hébal' (1832) is a prophetic forecast of the world's history, Hebel being a second-sighted chief of a Scottish clan. He also wrote 'Le vieillard et le jeune homme' (1819); etc.

Bal'lantine, James, Scottish artist and poet: b. Edinburgh, 11 June 1808; d. 18 Dec. 1877. He was brought up as a house-painter, but afterward learned drawing under Sir William Allen and was one of the first to revive the art of glass-painting. He was commissioned to execute the stained-glass windows for the House of Lords, and in 1845 published a treatise on glass-staining, which was translated into German. Two prose volumes, 'The Gaberlunzie's Wallet' (1843), and 'The Miller of Deanhaugh' (1845), contain some of his best-known songs and ballads. He was author of 'Poems'

(1856 and 1865); 'One Hundred Songs with Music' (1865); 'Life of David Roberts, R. A.' (1866); and 'Lilias Lee' (1871).

Ballantine, William Gay, American educator: b. Washington, D. C., 7 Dec. 1848. He was graduated at Marietta College 1868, and at the Union Theological Seminary 1872; spent a year in study in Leipsic; was attached to the American Palestine Exploring Expedition of 1873; professor of chemistry and natural science in Ripon College 1874–6; professor of Greek and Hebrew in the University of Indiana 1878–81; professor of Old Testament language and literature at Oberlin Theological Seminary 1881–91; and president of Oberlin College 1891–6. Dr. Ballantine was one of the editors of the 'Bibliotheca Sacra' (1884–91).

Bal'lantyne, James, Scottish printer: b. Kelso, 1772; d. Edinburgh, 1833. Successively a solicitor and a printer in his native town, at the suggestion of Sir Walter Scott he removed to Edinburgh, where the high perfection to which he had brought the art of printing, and his connection with Scott, whose works he printed, secured him a large trade. The firm of James Ballantyne & Company included Scott, James Ballantyne, and his brother John (who died in 1821). For many years he conducted the Edinburgh *Weekly Journal.* His firm was involved in the bankruptcy of Constable & Company, by which Scott's fortunes were wrecked, but Ballantyne was continued by the creditors' trustee in the literary management of the printing-house. He survived Scott only about four months.

Ballantyne, James Robert, Scottish Orientalist: b. Kelso, Scotland, 1813; d. 1864. After receiving an education at Hailey Tury College he was sent to India, where he was placed in charge of the Sanskrit College at Benares. On his return to England he was made librarian of the East India office. Among his writings are 'The Practical Oriental Interpreter' (1843); 'Catechism of Sanskrit Grammar'; 'Synopsis of Science in Sanskrit and English, reconciled with the Truths to be found in the Nyaya Philosophy' (1856); 'Christianity Contrasted with Hindu Philosophy' (1859).

Ballantyne, Robert Michael, Scotch writer: b. Edinburgh, 1825; d. Rome, Italy, 8 Feb. 1894. He spent his youth in Canada in the service of the Hudson Bay Company, but in 1856 adopted literature as a profession. He became very popular in England as a writer of stories for boys. Among the best known are 'Deep Down,' 'The Coral Island,' 'The World of Ice,' 'Ungava,' 'The Dog Crusoe,' and others.

Ballarat', or **Ballaarat,** an Australian town in the colony of Victoria, the chief centre of the gold-mining industry of the colony, and the place next in importance to Melbourne, from which it is distant west-northwest 74 miles by rail. It owes its present importance and prosperity to its being the centre of one of the richest gold-yielding districts of the world. It consists of two distinct municipalities, Ballarat West and Ballarat East, which are separated by Yarrowee Creek. The town is well lighted with gas, abundantly supplied with water, and contains many handsome public edifices, among which may be mentioned the city hall, council-chamber, two town halls, a spacious hospital, an orphan asylum, a benevolent asylum, a lying-in hospital and refuge, public baths, a jail, mechanics' institute (with 22,500 volumes), a free library (with 15,000 volumes), a theatre, and several other places of amusement, post-office, extensive railway premises, forty churches, two cathedrals, the palaces of the Anglican and Roman Catholic bishops, two colleges, four grammar and various other schools, a school of mines, many banks, numerous fine hotels, etc. There are several iron-foundries, breweries and distilleries, flour-mills, woolen-mills, and other factories. Gold was first discovered at Ballarat in June 1851, and the extraordinary richness of the field soon attracted hosts of miners. When the surface diggings became exhausted it was discovered that richer deposits of the precious metal lay at greater depths, and now there are mines as deep as some coal-pits. They are worked by steam-pumping and other machinery, and give employment to over 6,000 men, about 1,000 of whom are Chinese. One of the largest nuggets ever found anywhere was discovered here, and was sold for $52,000. The surrounding district is also eminently suitable for farming and sheep-breeding. In addition to the line to Melbourne, Ballarat has railway connection with Geelong, Ararat, Maryborough, Castlemaine, etc. Pop. (1897) 46,137.

Bal'last. (1) Heavy matter, as stone, sand, iron, or water placed in the bottom of a ship or other vessel, to sink it in the water to such a depth as to enable it to carry sufficient sail without oversetting. (2) The sand placed in bags in the car of a balloon to steady it and to enable the aëronaut to lighten the balloon by throwing part of it out. (3) The material used to fill up the space between the rails on a railway in order to make it firm and solid.

Bal'lentyne, or **Bal'lenden, John,** Scottish poet, and translator of Boece's 'Latin History,' and of the first five books of Livy into the vernacular language of his time: b. Lothian toward the close of the 15th century; said to have died at Rome, 1550. He was in the service of James V. from the king's earliest years, and at his request he translated Boece's 'History,' which had been published at Paris in 1526, the translation being printed in 1536. As a reward he was made archdeacon of Moray and a canon of Ross. He was a bitter opponent of the Reformation.

Balleny (băl'lā'nę) **Islands,** a group of five small volcanic islands, discovered by Balleny, in the Antarctic Ocean in 1839, nearly on the Antarctic Circle, and in lon. 164° E. One of the islands, Young Island, contains a very lofty mountain, about 12,000 feet high.

Ballesteros, bäl-yĕs-tā'rōs, **Francisco,** Spanish general: b. Saragossa, 1770; d. Paris, 22 June 1832. He first served in Catalonia against the French during the campaigns of 1792 and 1795, and was appointed to a captaincy. Discharged in 1804 on account of embezzlement, he was nevertheless entrusted by the all-powerful Godoy, "prince of the peace," with one of the most productive offices in the custom-house, the direction of the *resguardo* at Oviedo. When the French army invaded Spain in 1808, Ballesteros was promoted to a colonelcy by the provincial junta of Asturia, and joined the Castilian army under Castaños and Black. The regency of Cadiz promoted him to the rank of lieutenant-general and put him in command of the army of

Andalusia. He had then to fight against some of the most skilful chiefs of the French army, and succeeded in avoiding their pursuit by peculiar tactics. When Wellington was entrusted in 1812 with the general command of all the armies in the Peninsula, Ballesteros showed such violent opposition that he was arrested as guilty of treason and sent as a prisoner to Ceuta. A few months later he was restored to liberty, but was not allowed to re-enter the military service. On the return of Ferdinand VII. to Spain Ballesteros made such a show of devotion to monarchical principles that he was appointed secretary of war, but was soon dismissed and sent to Valladolid, where he was placed under the strictest surveillance. When the struggle between the royalists and the constitutionalists commenced, he managed so artfully that each party thought Ballesteros was acting in concert with them. Commissioned by the chiefs of the latter to obtain the assent of the king to the constitution, he succeeded beyond their anticipations and became a member of the council of state, while he was at the same time admitted in the *communeros* association. This double-dealing seemed to be perfectly successful, for in 1823, on the entry of the French into Spain he was appointed to the command of the army; but instead of showing fight he concluded a capitulation with the Duke of Angoulême, which became the occasion of accusations of such a character that Ballesteros thought it imprudent to stay any longer in his own country, and took refuge in France, where he died a forgotten exile.

Ballestrem, băl'lĕs-strām, **Franz Xaver, Count von,** German statesman: b. Plawniowitz, in Upper Silesia, 1834. Entering the Prussian army he served during the Austro-Prussian campaign of 1866 and the Franco-Prussian war of 1870–1. At the close of the latter he was elected to the Reichstag, where he soon became prominent in the Centre party. Pius IX. appointed him a papal chamberlain for his activity in the Culturkampf, and he was first vice-president of the lower House, 1890–3.

Ballet, băl'lā, or băl'lĕt, (from *bal;* from the French *baller,* and the Italian *ballare,* to dance), a kind of dance now usually constituting an interlude in a theatrical performance. In its widest sense a ballet is the representation of a series of passionate actions and feelings by means of gestures and dancing. In a more confined sense we call ballets musical pieces, the object of which is to represent by mimic movements and dances, actions, characters, sentiments, passions, and feelings, in which several dancers perform together. According to the analogy of lyrical poetry those which rather represent feelings may be called lyrical ballets; those which imitate actions, dramatic ballets. The lyrical and dramatic ballets, together, constitute the higher art of dancing, in opposition to the lower, the aim of which is only social pleasure. Dramatic ballets are classed as historical, the subject of which is a real event; mythological, in which the subject is some fabulous action; and poetical, founded on poetical fiction, to which belong also the allegorical, necessarily the most imperfect. A ballet is usually divided into several acts, each of which has several *entrées.* An *entrée,* in a ballet, consists of one or several quadrilles of dancers, who, by their steps, gestures, and attitudes, represent a certain part of the action. In criticising a ballet we must consider, first, the choice of the subject, which must have unity of action or of passion, and be capable of being represented in an intelligible manner by means of mimic movements and dancing; secondly, the plan and execution of the single parts, which must have due proportion to each other; and, finally, the music and decorations, which must supply whatever dancing cannot bring before the eye. The ballet is an invention of modern times. Baltazarini, director of music to Catherine de' Medici, probably gave its form to the regular ballet, though pantomimic dances were not unknown to the ancients. The ballet owes much to the French, and particularly to Noverre.

Balliet, Thomas M., American educator: b. 1 March 1852. He was educated at Franklin and Marshal College (Lancaster, Pa.) and at Yale, was appointed superintendent of public schools in Springfield, Mass., and also became associate editor of the 'Pedagogical Seminary.' His writings include 'Some New Phases of Educational Thought.'

Balliol (băl'yŏl) **College,** Oxford, an important college founded between 1263 and 1268 by John Balliol (q.v.). The original foundation consisted of 16 poor scholars, and the revenue for their maintenance amounted for many years to only 8d. per week for each. From 1340 to 1830 the college was greatly enriched by various benefactions. The society consists of a master, 13 fellows, and 24 scholars. The number of members on the books is about 600. The master and fellows enjoy the privilege of electing their own visitor. John Wyclif was master of this college in 1361; among its scholars have been John Evelyn, Bradley the astronomer, Mathew Arnold Swinburne, and the late Archbishop Temple. The Snell exhibitions for students of Glasgow University attract annually to this college a few distinguished Scottish students.

Ballis'tic Galvano'meter, a galvanometer (q.v.) designed or used for the measurement of electric currents of very short duration. It does not necessarily differ in any essential particular from other galvanometers, except that the natural period of oscillation of its needle must be long in comparison with the duration of the transient currents that are to be measured. If C is the intensity of the current that is to be measured, and t is the time during which it passes, the general theory of the instrument is as follows: The magnetic moment tending to deflect the needle is proportional to C, and the angular velocity that such a magnetic moment can produce when acting upon a freely suspended body like the needle is proportional to t. Hence the angular velocity actually communicated to the needle is proportional both to C and to t; or, in other words, it is proportional to the product Ct. But an electric "current" (such as is here denoted by C) is defined as the quantity of electricity passing per second; and hence Ct is the quantity of electricity passing in the time t. The angular velocity actually communicated to the needle (which is inferred by observing the extent of the swing) is therefore proportional to the total quantity of electricity passed through the galvanometer during the short time t, and not to

the intensity of the current. This constitutes the chief peculiarity of the instrument. The ballistic galvanometer measures the total quantity of electricity passed through the instrument, and its readings are in coulombs; while other galvanometers measure the intensity of the current passing, and their readings are in amperes. If the needle of the instrument moves sensibly during the passage of the current, the magnetic movement exerted upon the needle will also vary, even though the current itself remains constant. It is for this reason that the period of free swing of the needle must be long if the instrument is to be used ballistically.

Ballis'tics. See ORDNANCE.

Bal'listite. See EXPLOSIVES.

Balloon', a bag-like receptacle filled with hydrogen, coal-gas, or other light gaseous matter, and designed to rise in the air. The first balloon was constructed by Stephen and Joseph Montgolfier, sons of Peter Montgolfier, a well-known paper-maker of Annonay, France. Observing the suspension of clouds in the air, they conceived the idea of filling a light bag with some substance of a cloud-like nature, and trying it to see if it would not ascend. After experimenting on a small scale with paper bags filled with smoke, they constructed a linen bag about 30 feet in diameter and inflated it with hot air from a fire fed with chopped straw. The attempt was entirely successful, and on 5 June 1783, the balloon rose to a height of about a mile and a half in the presence of a considerable number of amazed spectators.

As might be expected, an experiment of so novel a nature attracted a great deal of attention, and only two months later a balloon was constructed on more scientific principles by M. Charles, of Paris. The bag used by M. Charles was made of thin varnished silk, and inflated with hydrogen gas generated by the action of sulphuric acid upon iron filings. Some difficulty was found in filling the bag satisfactorily, but the task was completed at the end of four days, and on 27 Aug. 1783, the balloon rose from the Champ de Mars to a height of 3,000 feet, remaining in the air for about three quarters of an hour and eventually falling in a field about 15 miles away, where it was torn to shreds by terrified peasants. The excitement in Paris was very great, and plans were laid to build balloons large enough to sustain human beings. After several trials with a captive balloon of the hot-air or Montgolfier type, M. François Pilâtre de Rozier, satisfied that there would be no difficulty in maintaining a fire under the balloon while in the air, made an ascension from the Bois de Boulogne on 21 Nov. 1783, accompanied by the Marquis d'Arlandes. They remained in the air about 25 minutes, during which time they rose to a height of 500 feet and traversed a horizontal distance of over five miles. Ten days later, on 1 Dec. 1783, MM. Charles and Robert made a similar ascension in a balloon filled with hydrogen. They rose to a height of 2,000 feet, and returned to the earth, after about two hours, at Nesle, about 27 miles from their starting-point at Paris. M. Robert then left the car, and M. Charles made a second ascent alone. Owing to an error in the amount of ballast taken in to compensate for the weight of M. Robert, the balloon, when freed, rose rapidly to a height of about two miles, but no accident resulted, and M. Charles returned to the earth safely.

One of the most famous balloon ascents was that made by Glaisher and Coxwell on 5 Sept. 1862, its avowed object being to ascend to as great a height as possible. The balloon left the ground at 1.03 P.M. and at 1.49 it had attained an altitude of no less than five miles. The temperature then observed was 2° F., the temperature at the earth's surface being 59° F. Mr. Glaisher's own account is as follows:

> Up to this time I had taken observations with comfort. I had experienced no difficulty in breathing, while Mr. Coxwell, in consequence of the necessary exertions he had to make, had breathed with difficulty for some time. At 1.51 the barometer reading was 10.80 inches . . . I could not see the column of mercury in the wet-bulb thermometer; nor afterward the hands of the watch, nor the fine divisions on any instrument. I asked Mr. Coxwell to help me read the instruments, as I experienced a difficulty in seeing. In consequence, however, of the rotatory motion of the balloon, which had continued without ceasing since the earth had been left, the valve-line had become twisted, and he had to leave the car and mount into the ring above to adjust it. At this time I looked at the barometer and found it to read 9¾ inches, implying a height of 29,000 feet, and it was still falling fast. Shortly afterward I laid my arm upon the table, possessed of its full vigor, and on being desirous of using it I found it powerless. I tried to move the other arm and found it powerless also. I then tried to shake myself and succeeded in shaking my body. I seemd to have no limbs. I then looked at the barometer, and while doing so my head fell on my left shoulder. I struggled and shook my body again, but could not move my arms. I got my head upright, but for an instant only, when it fell on my right shoulder, and then I fell backward, my back resting against the back of the car, and my head on its edge; in this position my eyes were directed toward Mr. Coxwell in the ring. When I shook my body I seemed to have full power over the muscles of the back, and considerable power over those of the neck, but none over either my arms or my legs; in fact, I seemed to have no arms or legs. As in the case of the arms, all muscular power was lost in an instant from my back and neck. I dimly saw Mr. Coxwell in the ring and endeavored to speak, but could not; and in another instant intense black darkness came; the optic nerve finally lost power suddenly. I was still conscious, with as active a brain as at the present moment while writing this. I thought I had been seized with asphyxia, and that I should experience no more, as death would come unless we speedily descended; other thoughts were actively entering my mind when I suddenly became unconscious as on going to sleep. I cannot tell anything of the sense of hearing; the perfect stillness and silence of the regions six miles from the earth (and at this time we were between six and seven miles high) is such that no sound reaches the ear. My last observations were made at 1.54, at 29,000 feet. I suppose two or three minutes, fully, were occupied between my eyes becoming insensible to seeing fine divisions and 1.54, and then that two or three minutes more passed till I was insensible; therefore I think this took place at about 1.56 or 1.57. While powerless I heard the words "temperature" and "observation," and I knew Mr. Coxwell was in the car speaking to me and endeavoring to arouse me; therefore consciousness and hearing had returned. I then heard him speak more emphatically, but I could not see, speak, or move. I heard him again say, "Do try — now do." Then I saw the instruments dimly, then Mr. Coxwell; and very shortly I saw clearly. I rose in my seat and looked around, as though waking from sleep but not refreshed by sleep, and said to Mr. Coxwell, "I have been insensible." He said, "You have; and I too, very nearly." I then drew up my legs, which had been extended before me, and took a pencil in my hands to begin observations. Mr. Coxwell told me that he had lost the use of his hands, which were black, and I poured brandy over them. I resumed my observations at 2.07, recording the barometer reading at 11.28 inches and temperature — 2° F. I supposed that three or four minutes were occupied from the time of my hearing the words "temperature" and "observation" till I began to observe. If so, then returning consciousness came at 2.04, and this gives seven minutes for total insensibility. Mr. Coxwell told me that while in the ring he felt it piercingly cold; that hoar frost was all around the neck of the balloon; that on attempting to leave the ring he found his hands frozen, so that he had to place his arms on the ring

and drop down; that he thought for a moment I had lain back to rest myself; that he spoke to me without eliciting a reply; that he then noticed my legs projected and my arms hung down by my side; that my countenance was serene and placid, without the earnestness and anxiety he had noticed before going into the ring, and then it struck him I was insensible. He wished to approach me, but could not, and he felt insensibility coming over himself; that he became anxious to open the valve, but in consequence of his having lost the use of his hands he could not, and ultimately did so by seizing the cord with his teeth and dipping his head two or three times until the balloon took a decided turn downward. No inconvenience followed this insensibility, and when we dropped it was in a country where no conveyance of any kind could be obtained, so that I had to walk between seven and eight miles. The descent was at first very rapid; we passed downward three miles in nine minutes; the balloon's career was then checked, and it finally descended in the centre of a large grass field at Cold Weston.

Another extremely high ascension was made on 4 Dec. 1894, by Prof. Berson, from Berlin, Germany. His last reading showed a barometric height of 9.12 inches, and a temperature of —54° F. The temperature at the surface of the earth was 37° F., and the barometric height 30.02 inches. The calculated height attained was 28,750 feet.

The balloon, strictly speaking, is not a flying-machine, nor is it ordinarily under control, so far as its horizontal direction is concerned. It moves with the wind, and (to the aëronaut) is in a calm at all times. The first step in advance of the drifting balloon is to be found in one fitted with some form of propelling machinery, by which the movement is controlled and the balloon navigated and made to move to a certain extent independently of the direction and velocity of the wind. The difficulties lying in the way of a satisfactory solution of the problem of controlling the motion of a balloon are very great. The bulk of the balloon is necessarily vast, and a correspondingly large area is exposed to the action of the wind. Also, the motor that is used must combine great power with extreme lightness.

In working this problem out, France has maintained the lead that her early experiments gave her. A regular balloon corps is attached to the army, both in France and in Germany; and for many years special attention has been directed to the design and construction of dirigible balloons. The details of the mechanisms employed, as well as of the exact contour of the gas envelope, are guarded as military secrets, but enough is known about them to give a general idea of what has been done. Attention was first publicly directed to the success attained with the dirigible balloons of the French army in 1893, by an article in the *Mémoires de la Société des Ingénieurs Civils*. The true progenitor of the dirigible balloon was Gen. Meusnier, who, in a series of papers published in 1783, set forth a scheme for a balloon of this sort. It was not until 1852, however, that Henri Giffard made a rational attempt to construct one. His balloon was spindle-shaped and measured about 144 feet from point to point. His motor was, however, too weak to permit of making any headway against even a moderate breeze, though the balloon could be steered and made to describe circles while drifting. His general form of envelope-construction has been followed by all experimenters since that time.

In 1870 M. Dupuy de Lome undertook the task of constructing a dirigible balloon. The propeller used was two-armed, 19 feet 8 inches in diameter and was turned by eight men. The spindle shape was used for the envelope. A trial was made at Vincennes in 1872, where in a breeze of 39 feet per second a deviation of 12° was obtained. The stability was perfect despite the exertions of the eight men at the crab; still the balloon was a drifting one, and was dirigible only in the sense that it could be made to deviate to a slight extent from the true course of the wind. To an outside observer the problem seemed as far from solution as ever; but when taking into consideration the insufficiency of the motor, the committee appointed to be present at the trial said: "It serves as a starting-point for all who wish to continue in this direction."

Others have endeavored to continue the improvement, and the first to achieve results that even approached success was M. Gaston Tissandier, who, with his brother Albert, in 1884, constructed a balloon that was fitted with a Siemens motor driven by a bichromate of soda battery, very ingeniously arranged so as to minimize the weight and at the same time produce the greatest possible effect. The motor weighed 121 pounds and the cells weighed 496 pounds, and contained liquid enough to work for 2½ hours, generating during that interval 1⅓ horse-power. The screw had two arms and was a little over nine feet in diameter. Several ascensions were made with this balloon. In one, undertaken in 1884, the motor developed 1½ horse-power and was sufficient to propel the structure through the air at a rate of 13 feet per second. After having practically followed the direction of the wind, which had a velocity of about 10 feet per second, during which the rudder turned it aside a little, the balloon was made to describe a semi-circle, and brought up with its head into the wind, where it was navigated for about 10 minutes directly above Grenelle, and the same evolution was repeated above the observatory. Through the exhaustion of the battery it became impossible to return to Paris. These experiments were quickly followed by the work of Commandant Renard of the French balloon corps. With a spindle-shaped balloon, but with a more powerful motor, and the screw placed at the front instead of at the rear, he succeeded in making several ascents and returning to the point of departure. The motor developed 8.5 horse-power, with a weight of 220.5 pounds. In an ascension made on 23 Sept. 1885, the balloon started from Chalais-Meudon against the wind, and went to Paris, where it was easily handled, afterward returning to Chalais.

This work has been continued by the French balloon corps until now the army is possessed of a dirigible balloon that may be considered controllable in light airs. The problem has not been left solely to the military departments of the several nations of the the earth for solution, however, for private investigators have been constantly at work upon it. In 1901 a young Brazilian named Santos Dumont made a series of brilliant experiments in France, constructing several balloons, one after another, each being an improvement on its predecessor. In striving for a prize of $20,000 offered by M. Deutsch for the first dirigible balloon that should start from the Parc d' Aérostation at St. Cloud and be sailed around the Eiffel Tower in Paris and brought back to

the starting-point in thirty minutes, Santos Dumont succeeded in covering the ground in but 40 seconds above the stipulated time. The total distance is a little less than nine miles. This balloon (his sixth) had a length of 108 feet and a diameter of 19 feet 6 inches, and was driven by a 4-cylinder petroleum motor weighing 216 pounds and developing 20 horse-power. The screw was a little more than 13 feet in diameter, and was turned at a speed of 300 revolutions per minute. Instead of the old-fashioned network, the basket and machinery were suspended directly from the envelope by strong piano wire. Japanese silk was used for the envelope itself, and was made impervious to the gas by four coats of linseed oil. See also AËRIAL LOCOMOTION; FLYING-MACHINE.

Balloon Vine (*Cardiospermum Helicacabum*), a tropical American and East Indian climbing annual herb of the natural order *Sapindaceæ*, with racemes of small white flowers followed by bladder-like seed-vessels from which the plant is named. It is a general favorite of easy garden culture.

Bal'lot ("little ball"): essentially, a secret as distinguished from an open vote, to secure the voter from previous intimidation or subsequent revenge. Recent methods of ballot-reform, therefore, are only devices to obtain the result inherent in its very nature, a non-secret ballot being a contradiction in terms and the same as *viva voce* voting. The various forms of ballot reduce to two in essence: ballots themselves indicating choice,—as colored balls, printed tickets, or mechanical devices showing names,—and depositories indicating the choice. The former is universal in modern times and most general in ancient.

The ballot must be nearly as old as the practice of voting by unprotected bodies of citizens; but our first knowledge of it is in classic Greece, where the *dikasts* (popular courts and juries) voted "yes" or "no" by balls of stone or metal (white or unpierced meaning acquittal, black or pierced indicating condemnation), by marked shells (*ostrakoi*, whence "ostracism" or banishment of an unpopular leader), or by olive leaves ("petalism"). In the assemblies the common voting was by show of hands, to secure public responsibility; in cases of privilege or ostracism it was by ballot. In Rome the first ballot law (though far from the first balloting) was the Gabinian, 139 B.C., and the machinery is very modern: *tabellæ*, or tickets, with candidates' names, or "yes" and "no" ballots for changes in the laws; boxes, inspectors, and check-lists; but in case of a tie the candidates drew lots. In the mediæval republics the ballot was a regular machinery; but it has been bitterly fought and slow of introduction in all non-republican countries, the governments and the privileged classes being loth to weaken their power of dragooning their officials or the lower classes into obedience. In Scotland it was used in 1662 under the name of "billeting," to banish political opponents (ostracism); but the English government disallowed the act. In England it was first put forward to protect members of parliament against government revenge for voting against its bills, not the electors against the classes which furnished the members of parliament; in 1710 the House of Commons passed a ballot law, but the Lords threw it out.

In the modern world the American colonies of England were by far the first to make the ballot (voting "by papers") the foundation of the governmental system: they used it from the first, and it was made obligatory in several of the State constitutions adopted in 1776. New York, with its great landed aristocracy, was slower, using it only for the governor and lieutenant-governor in 1778, and not extending it to the legislature till 1787. The southern States held to the *viva voce* system for many years after, and Kentucky till 1891, its constitution providing for it, though the United States statutes compelled it to use written or printed ballots for Congressional elections. All the State constitutions now provide for elections by ballot.

In Great Britain it was not only fought by the privileged classes as overthrowing their leadership of the tenants and artisans, but by a large part even of the Liberals as undermining the manliness of the English character. The vanguard of the movement were the Benthamites, and it stood foremost in the programme of reform put forward by the more radical Whigs early in the 19th century. It was in the first draft of the Reform Bill of 1832; in 1833 Grote the historian introduced it, and repeated the attempt every year till 1839 with a fresh speech of immense force and learning. It was supported by Macaulay with his usual effectiveness, but was sneered at by so good a Liberal as Sydney Smith, and heartily supported by none but the Chartists, whose support alone would have killed it. They made it one of the "six points" of their "People's Charter." In 1851 it was carried in the Commons by 51 majority against Lord John Russell and his Liberal government, but went no further. In 1869 it was tried at Manchester as a test, and worked well; was adopted at school-board elections in 1870; and the same year a select committee of the House, headed by Lord Hartington, reported in its favor as a means of lessening corruption, "treating," and intimidation. In 1872 Mr. W. E. Forster's ballot act made printed ballots compulsory at all national and municipal elections except those of university candidates for parliament. This put an end to the drunken riots attending the previous public nominations at the hustings, so keenly satirized by Dickens and others.

In France, Spain, Belgium, Switzerland, and Cisleithan Austria the ballot is now used; in Hungary it was formerly employed in all elections, but in 1874 was restricted to municipal councils.

The interest of governments and privileged classes in aristocratic countries to defeat the secrecy of the ballot is replaced in democratic ones, of which the United States is chief, by the interest of party managers, who wish either to prevent independent voting through fear of loss of employment or favor, or to make sure of purchased votes being given as promised; they have therefore devised various methods of evading the nominal secrecy of the vote, such as ordering the voter to write his name or some understood sign on the ballot before depositing it, holding it in sight of the party watcher while casting it, having a "friend" accompany him to the polls on pretense of his illiteracy and inability to go through the legal forms without help, etc. These enforce as constant a struggle from

the guardians of political honesty to circumvent them: the first has been stopped by throwing out as illegal all ballots with distinguishing marks on them; the second by compelling them to be cast in sealed official envelopes, and by forbidding any but the official registrars to come within a certain distance of the polls for any purpose but to vote, and later by providing booths in which each voter prepares his ballot in privacy; the third is practically confined to certain States and cities with a large percentage of real illiteracy under which the feigned article can cover itself and cannot well be directly reached by law, but only by the vigilance of each party in exposing the fraudulent practices of the other. The ballot itself also has brought in many frauds for which the *viva voce* system gave no opportunity, which are reducible to three kinds: (1) counterfeiting, either by printing the name of one party over the candidates of another, or by substituting one or more names on the opposite party's ticket; (2) "stuffing" the ballot-box by folding two or more ballots, all but one being sometimes of tissue paper, to look like one; (3) "repeating," one man voting at different polling-places more than once or at the same one under different names. The first must be defeated by party vigilance; the second is used only where one party has the control of ballot inspection, though the law usually provides that both the chief parties shall have a share in this; the third and second are punishable by law.

Another evil, as diminishing individual responsibility for votes and building up unprincipled and corrupt party dominance, though not direct fraud like the others, is the "party ballot." This is due to the great multiplication of candidates to be voted for at one time, and the consequent cost of printing and distributing the ballots to voters, which has led to the abandonment of the candidates themselves doing this work, and the forming of party organizations for it, which, in return for their efforts insist on subservience and are apt to have slight scruples about gaining their ends. All these evils together — the misuse of ballot methods to pervert their intent, the only partial secrecy, and the supremacy of party in the voting — have latterly built up a great body of opinion that some better methods should be devised, the general movement being known as "ballot reform."

The party ballot has in many States been set aside by some form of the so-called "Australian ballot" (from its first use in South Australia), or official ballot, furnished by the State. The essential feature of the plan is that all candidates in the field for any office shall be placed on one ballot, and the voter compelled to indicate his preference by a mark against one; thus forcing him to think personally concerning each one, inviting to independence of judgment, breaking down the tyranny of the party vote, and putting some intelligence into the "brute vote" even though the name of the party of each candidate is added. The first States to adopt the system were Massachusetts for the whole State, and Kentucky for Louisville, in 1888; and in 1895 every State in the Union except Georgia, Louisiana, and North and South Carolina had adopted some modification of the system. But the modifications were important; they were due to struggles of the local party organizations for one of two objects, or both,— to defeat the secrecy of the new régime and keep track of the purchased votes, or to prevent "scratching" and ensure that their voters should cast "straight tickets"; in other words, to emasculate the system of its vital principle. The ideal and typical form is the "blanket ballot," wherein all candidates are given in the alphabetical order of the offices without regard to party; but this is strongly opposed on the nominal ground that the illiterate voters, and a large part of those not technically such, do not wish to vote anything but the straight party ticket, and should not be hindered in their choice, much less deprived of it. In concession to this useful element of citizenship, most of the States group the names and offices by parties. In general there is a blanket ballot with all parties on it, but each party given a column by itself, with some conspicuous device, like an eagle or a star, at its head, which the illiterate can be taught to recognize; the voter, in order to vote the straight ticket, making a cross in the circle under the emblem, while for a scattered or split vote he makes the cross in the space before the desired name. In New York and New Jersey this is carried further still, each party having a separate ticket and pasters being allowed; which is in fact the old-fashioned sort, the modifications having taken all the distinctive features out of the system, except the State supply.

A newer feature of ballot reform is the substitution for the ballot paper, which is folded and deposited by hand, of voting-machines, which are contrivances that both record the votes and count them, enabling the inspectors to see at any moment how many votes have been cast, and for whom. Several States have authorized the use of machines, and others are considering the matter. Three varieties of the voting-machine have been legally sanctioned: (1) The Myers, in which the single ballot is placed in a frame having a push-knob for each candidate, the voter indicating his choice by pushing the knob opposite his candidate's name, when the machine indicates the vote on a dial at the back of the frame, and locks the knobs of all other candidates for the same office (before a second voter is ready, all knobs are unlocked); (2) the McTammany, which contains on its face a slot for each office, beneath which is a card bearing the names of the candidates for the office seen through the slot, the voter's choice being indicated by turning a wheel till the name of his candidate appears, when he pushes a knob which punctures the tally-sheet; and (3) the Rhines, in which the names are arranged as in the Myers, by parties and offices. Slip names are inserted in the push buttons; and separate tally-sheets for each candidate, with vertical serial numbers, are placed beneath the face, the voter pushing a button which places a punch in such a position for each name that when the lid of the machine is closed the next number on each tally-sheet is punctured. See UNITED STATES, BEGINNINGS OF PARTY ORGANIZATION IN THE.

Ballou', Hosea, American clergyman and author: b. Richmond, N. H., 30 April 1771; d. Boston, Mass., 7 June 1852. His boyhood was spent in the greatest poverty, but at 21 he began to preach, having adopted the Universalist doctrines. He was successively pastor of congregations in Dana, Mass.; Barnard, Vt.; Ports-

mouth, N. H., and Boston, Mass., in which latter place he held his pastorate for more than 35 years. He founded the 'Universalist Magazine,' subsequently called 'The Universalist Expositor,' and again the 'Universalist Quarterly Review.' A voluminous writer, his chief works are: 'Notes on the Parables' (1804); 'Lecture Sermons' (1831); 'Examination of the Doctrine of Future Retribution' (1834), his most important contribution to theological literature. His published works would make more than a hundred 12mo volumes.

Ballou', Maturin Murray, American journalist, son of Hosea Ballou: b. Boston, 14 April 1820; d. 27 March 1895. Besides editing 'Ballou's Pictorial,' 'The Flag of Our Union,' 'Ballou's Monthly,' etc., and making a valuable compilation of quotations, he wrote 'History of Cuba' (1854); 'Biography of Hosea Ballou,' 'Life Work of Hosea Ballou.' Becoming in later life an extensive traveler, he wrote a number of books of travel, including 'Due West,' 'Due South' (1885); 'Due North,' 'Under the Southern Cross,' 'Footprints of Travel,' etc. In 1872 he became one of the founders and the editor-in-chief of the Boston *Globe*.

Ball's Bluff, Va., a point on the Potomac River, about 33 miles above Washington, where the bank rises about 150 feet above the level of the river. It is noted as the scene of a battle between a Union force under Col. Edward D. Baker, and a Confederate force under the command of Gen. Evans, 21 Oct. 1861. The battle resulted in the serious defeat of the Union force and the instantaneous death of Col. Baker.

Ballston Spa, N. Y., county-seat of Saratoga County, on the Delaware & Hudson R.R., seven miles south of Saratoga Springs. It is noted for its mineral springs, which rank among the best acidulous chalybeate springs in the country, and was formerly a popular summer resort, but is now most important for its manufactories, which include one of the largest tanneries in the world; extensive pulp and paper mills, and agricultural implement factories. It has two national banks, several churches, public high school, and daily and weekly newspapers. Pop. (1900) 3,923.

Ballyme'na, a market town in County Antrim, Ireland, on the River Braid, 25 miles northwest of Carrickfergus. It has a cotton-spinning mill, a distillery, numerous bleaching-grounds, a church, chapels, large public schools, several branch banks, and a United States consular agency. Pop. (1900) 9,000.

Balm (*Melissa officinalis*), a perennial herb of the natural order *Labiatæ*, native of southern Europe, cultivated for culinary use and found wild as an escape in many countries. It attains a height of about 18 inches, is much branched, has ovate leaves and whorls of white or yellowish axillary flowers rich in nectar, for which the plant is sometimes cultivated as bee-forage. Its foliage, which has a lemon-like odor and slightly aromatic taste, is used to flavor wine and to a small extent in domestic medicine. Some other members of the *Labiatæ* are called balm — for instance: Bastard balm (*Melittis melissophyllum*), a handsome member of the same family, often dried for its long-enduring fragrance. Moldavian balm (*Dracocephalum moldavica*), a Siberian annual of less pleasant qualities than true balm, largely used in Germany for flavoring. Horse balm (*Collinsonia canadensis*) and tea balm (*Monarda didyma*) are American species of little importance. A variety of catnip (*Nepeta cataria*) so closely resembles true balm as often to be mistaken for it. For cultivation see HERBS (*Culinary*).

Balm of Gilead, a liquid resinous balsam highly reputed in the East since Bible times for its fragrance and supposed medicinal properties, believed to be derived from *Commiphora opobalsamum*, a small Abyssinian and Arabian tree. Balm of Mecca, or opobalsam, is a specially high grade of balm of Gilead obtained from incisions in the bark. The wood and fruit are boiled to obtain the inferior grades. The balm of Gilead of the United States is a variety of poplar (*Populus balsamifera*, var. *candicans*). See POPLAR.

Balmaceda, bäl-ma-sā'da, **José Manuel,** Chilean statesman: b. Santiago, 1840; d. 18 Sept. 1891. He was educated at the Seminario Conciliar in Santiago; early became noted as an orator, urging radical reforms in the Constitution of 1833; and was a founder of the Reform Club in 1868. As deputy for five terms, 1870–85, he urged the separation of Church and State and became the leader of the Progressives. He was Chilean minister at Buenos Ayres in the early part of the Chile-Peru war, 1879–83, and secured the neutrality of Argentina. In 1882 he was made minister of the interior, and introduced liberalizing bills, as for civil marriage, etc. In 1885 he was elected senator and appointed minister of foreign affairs. Elected president in 1886, he carried out large schemes of reform and democratization; popular education was extended, civil marriage carried in 1888, railroads and other internal improvements forwarded. But both his measures and men involved war against the clerico-oligarchy which not only ruled the state but monopolized the offices, and comprised the bulk of the property and influence; and when he tried to prevent the ruin of his work by «influencing» the election of a like successor, his opponents blocked the administration. He appointed a ministry of his own stripe and dissolved Congress, virtually making himself dictator; but the Congressionalists, having the naval officers on their side, began war 7 Jan. 1891, secured the nitrate provinces, and, using their revenues to buy the best arms and munitions, utterly routed Balmaceda's forces in a decisive battle near Valparaiso, 7 August. He took refuge in the Argentine legation at Santiago, and committed suicide there a few weeks later.

Balme, bäm, **Col de,** an Alpine pass, forming the boundary between Savoy and the Valais, 7,218 feet above sea-level. It is much visited, and has a travelers' refuge.

Balmerino, bäl-mer-ē'nō, **Arthur Elphinstone, Lord,** Scottish Jacobite: b. 1688; d. 1746. He took part in the rebellion of 1715, and fought at Sheriffmuir. Having joined the Young Pretender in 1745, he was taken prisoner at Culloden, tried at Westminster, found guilty and beheaded. His title was from Balmerino, in Fife.

Balmez, bäl'měth, or **Balmes,** bäl'mes, **Jaime Luciano,** Spanish priest and author: b. Catalonia, 28 Aug. 1810; d. 9 July 1848. His works include 'Protestantism Compared with

Catholicism in Its Relation to European Civilization' (3 vols. 1848); 'Filosofia Fundamental,' 'Letters to a Sceptic.'

Balmoral (băl-mŏr'al) **Castle**, the favorite Highland residence of the late Queen Victoria, beautifully situated on the south bank of the Dee, 48 miles west of Aberdeen, and in the county of the same name. The site on which it stands is almost completely hemmed in by majestic mountains, and the views from the castle are magnificent. Balmoral was originally a shooting-lodge of the Earl of Fife, but was leased to, and greatly enlarged by, a brother of the Earl of Aberdeen, and in 1848 the reversion of the lease was purchased by Prince Albert. The accommodation furnished by the old building was very inadequate, and accordingly, the property having been purchased in 1852, the present mansion was erected shortly afterward. It underwent some enlargement in 1888. It is built of gray granite, in the Scottish baronial style, and has a massive and imposing appearance in the distance. It consists of two blocks connected by wings, and has a massive tower 80 feet high, with a turret of 20 feet high. The estate, which was the queen's private property, comprises some 40,000 acres, three fourths being deer-forest.

Balnaves, băl-năv'ĕs, **Henry,** Scottish reformer: b. Kirkcaldy, 1520; d. 1579. He was educated at St. Andrews, and though at first a Roman Catholic he became a Protestant and made open profession of his faith in 1542; joining the English against Gov. Arran. He was accused of connection with the conspiracy to murder Cardinal Beaton, and was declared a traitor and excommunicated. In 1547 he was one of the prisoners taken in the Castle of St. Andrews and exiled to France, where he wrote his 'Confession of Faith.' Recalled in 1559, he busily engaged in the establishment of the reformed faith, assisted in revising the 'Book of Discipline,' and accompanied Murray to England in connection with Darnley's murder.

Balneol'ogy. See BATHS; HYDROPATHY; HYDROTHERAPY.

Balolo, bä-lō'lō, a large Bantu nation in the Equatorial Province of the Congo Free State, inhabiting the forests on the banks of the Chuapa, Bussera, and Lomami. Its settlements are interspersed with the villages of the Batwa dwarfs. The principal tribes of the Balolo are the Boruki, Bangombe, Dulingo, Imballa, and Kimoma. Agriculture exists among them to a certain extent, but they follow no pastoral pursuits. According to V. François all Balolo tribes are addicted to cannibalism. The territories inhabited by the Balolo belong to the most promising of Equatorial Africa, especially as the climate is more favorable to Europeans than it is in many other parts of the Congo Free State.

Balsa, băl'sa, a kind of raft or float, of the nature of a catamaran (q.v.), used on the coasts and rivers of Peru and other parts of South America for fishing, for landing goods and passengers through a heavy surf, and for other purposes where buoyancy is chiefly wanted. It is sometimes formed of two inflated hides connected by a sort of platform on which the fisherman, passengers, or goods are placed; and sometimes of a very light wood.

Balsam (*Impatiens balsamina*), an East Indian herb of the natural order *Geraniaceæ,* cultivated in gardens for more than 300 years. The plant is an erect free-branching annual sometimes 30 inches tall; bears axillary, diversely tinted yellow, white, or red single or often double flowers, the latter of which are called camellia-flowered varieties. The plant is a general favorite of easiest culture.

Balsamo, Joseph. See CAGLIOSTRO.

Balsamodendron, băl-sa-mō-den'drŏn, a genus of trees or bushes of the order *Amyridaceæ,* species of which yield such balsamic or resinous substances as balm of Gilead, bdellium, myrrh, etc. See BALSAM.

Balsams, mixtures of resins in volatile oils, the term, however, being popularly applied to any aromatic compound with volatile oils. Balsams are very widely distributed throughout the plant kingdom. They are particularly abundant in the members of the pine family. The araucarias yield a copal that is almost a pure resin; many species of pine yield turpentine and resin; Canada balsam is derived from *Abies balsamea;* the balsam-like sandarach is from a cypress. The *Hamamelis* family gives balsam of styrax, and balsam of copaiba is derived from a large number of the legumes and from the *Dipterocarpeæ.* Styrax benzoin is from the *Storax* family. The resins and balsams of commerce are very closely allied. They may be divided into three groups: gum resins, such as asafœtida and ammoniacum; balsams, and resins, such as turpentine, resin, copaiba, mastic, elemi, copal, dammar, and sandarach; and the balsams and resins that contain cinnamic or benzoic acids, from which they derive their aromatic odor. It is to this latter group that the word balsam is popularly applied. These are balsam of tolu, balsam of Peru, storax, benzoin, dragon's-blood and xanthorrhea resin.

These various bodies are for the most part secreted in special passages in the plants. Sometimes they are formed in the leaves, but for the most part the resinous solution collects in specially designed portions of the stem, usually in the woody portion. It is obtained in a variety of ways from simple incision to boiling chips of the wood with water.

In medicine most of these bodies are active. They are energetic oxidizers,—hence the traditions about ozone and pure air in pine-clad hills, —and several of the hydrocarbons in the volatile oils are stimulating to the skin and mucous membranes, turpentine being an excellent example. It is an excellent external antiseptic, and manifests similar properties on the respiratory, intestinal, and genito-urinary tracts. Those resinous or balsamic mixtures containing cinnamic and benzoic acids—notably balsam of tolu (from *Toluifera pereiræ*) and balsam of Peru (from *Toluifera balsamum*) possess similar antiseptic and stimulating properties. They are more powerful in proportion to the aromatic acids contained. Balsam of storax is derived from a tree, *Liquidambar styraciflua.* It has similar properties to the balsam of Peru.

The chrism (see SACRAMENTS) used for consecration and sacramental services should be made of balsam from Syria or Mecca; when this is difficult to obtain, **balsams** from Brazil or Peru may be used.

Balta, bäl'ta, **Jose,** Peruvian statesman: b. Lima, 1816; d. 26 July 1872. He retired from the army with the rank of colonel in 1855; was minister of war in 1865; one of the leaders in the insurrection which overthrew the unconstitutional president, Prado, in 1868; and was president of Peru, 1868–72. He was murdered in a military mutiny in Lima.

Balta, a town of Russian Poland, on the Kodema, one of the tributaries of the Bug, in the government of Podolia, 132 miles east-southeast of Kamieniec. Pop. about 32,000.

Baltard, bäl-tär, **Louis Pierre,** French architect and engraver: b. Paris, 9 July 1765; d. 22 Jan. 1846. He was appointed architect of the Pantheon and of the Paris prisons, and designed the chapels of the houses of detention of St. Lazare and St. Pelagie. The great hall of justice in Lyons, founded in 1834, was devised and almost completed by him. He also acquired fame as an engraver and as the author of many superb works descriptive of monuments and illustrated by his own plates. Among his most notable works in this line are 'Paris and Its Monuments'; 'La Colonne de la Grande Armée'; and illustrations in Denon's 'Egypt.'

Baltard, Victor, French architect: b. Paris, 19 June 1805; d. 14 Jan. 1874. He was son of Louis Pierre Baltard, and became government architect of France and a member of the Academy of Fine Arts. He built the church of St. Augustine and other beautiful edifices, and was author of 'Monographie de la Villa Medius' (1847), etc.

Balthazar, bäl-thā'zär, (1) one of the wise men of the East who came to worship Jesus at Bethlehem. (2) A character in Eichberg's opera, 'The Doctor of Alcantara.' (3) Chaucer's name for Belshazzar in "The Monk's Tale." (4) The name assumed by Portia in Shakespeare's 'Merchant of Venice'; also the name of minor characters in several of Shakespeare's plays.

Baltic (bâl'tĭc) **and North Sea Canal, or Kaiser Wilhelm Canal.** See CANALS.

Baltic, Battle of the, a poem by Thomas Campbell, celebrating the victory of Lord Nelson over the Danish fleet, 2 April 1801. In history this action is generally known as the battle of Copenhagen.

Baltic Lake Plateau, a low plateau extending from East Prussia to Schleswig-Holstein and Jutland, parallel to the south coast of the Baltic Sea; 750 miles long. In its eastern part the highest points are the Thurmberg, near Dantzig (1,086 feet), and the Kernsdorf Mountain (1,027 feet); more to the west, in Mecklenburg and Schleswig-Holstein, the altitudes decrease and the elevations become less defined, but even the last offshoots of the plateau in Schleswig and Jutland are of importance, as they form the watershed between the basins of the Baltic and North Sea. A characteristic feature of the region is the large number of lakes and ponds, some with very irregular outlines, others occupying wide basins or narrow river-like channels. The largest of these lakes are the Müritz-See (93 square miles) in Mecklenburg, and the Spirding-See (46 square miles) in East Prussia. Many of these lakes (mostly very small) in the eastern section (Pomerania and West Prussia) are without visible outlet. According to the most recent investigations the lake basins date from the glacial period, when a massive sheet of ice covered North Germany, the ridges and hollows of this plateau being due to the action of the ice.

Baltic Provinces (in Russia), a term generally given to the five Russian governments bordering on the Baltic, namely, Courland, Livonia, Esthonia, Petersburg, and Finland; in a restricted sense it often designates the first three. The Baltic provinces once belonged to Sweden, except Courland, which was a dependency of Poland. They came into the possession of Russia partly in the beginning of the 18th century, through the conquests of Peter the Great, partly under Alexander in 1809. No pains have been spared to Russianize them, and since 1876–7 they have lost their remaining privileges and been thoroughly incorporated in the Russian empire. They form, however, a borderland between the Germanic and Slavonic areas, and have been a frequent cause of difficulty between Germany and Russia. The bulk of the population is composed of Esths and Letts; the Germans number above 200,000, the Russians only 65,000. The five provinces combined have an area of 191,526 square miles, and a population (1897) of 7,015,126.

Baltic Sea, an inlet or gulf of the North Sea, with which it is connected by the Skagerrack and Kattegat. It washes the coasts of Denmark, Germany, Courland, Livonia, and other parts of Russia and of Sweden, and extends to lat. 65° 30′ N. It is nearly 900 miles long, from 40 to 200 broad, and its superficial extent, together with the contents of the gulfs of Bothnia and Finland, amounts to 160,000 square miles. Its small breadth; its depth, amounting on an average to from 40 to 50 fathoms, but in many places hardly half so much; its shallowness toward the Prussian shores, and the rugged nature of the Swedish coasts; but above all, the sudden and frequent changes of the wind, accompanied by violent storms, render this sea dangerous for navigators, although its waves are less powerful than those of the North Sea. A chain of islands separates the southern part from the northern, or the Gulf of Bothnia. In the northeast the Gulf of Finland stretches eastward and separates the province of Finland from Esthonia. A third gulf is that of Riga or Livonia. The Kurisches Haff and the Frisches Haff are inlets or lagoons on the Prussian coast. The water of the Baltic is colder and clearer than that of the ocean; it contains a smaller proportion of salt, and ice obstructs the navigation three or four months in the year. The ebb and flow of the tide are inconsiderable, as is the case in other inland seas, the difference between high-water and low-water mark being only about a foot; yet the water rises and falls from time to time, probably owing to the varying rainfall and evaporation. In stormy weather amber is often found on the coasts of Prussia and Courland, which the waves wash upon the shore. Many streams empty themselves into the Baltic; among them are the Neva, Dwina, Oder, Vistula, Niemen, and a number of Swedish rivers. Between the Kattegat and Baltic are the large Danish islands Zealand and Funen; others in the sea itself are Samsoe, Moen, Bornholm, Langeland,

Laaland, which belong to Denmark; the Swedish islands — Gottland and Oeland (besides Hveen in the sound, with the ruins of Oranienburg, the observatory built by Tycho Brahe); Rügen, belonging to Prussia; the Aland Islands at the entrance of the Gulf of Bothnia, and Dagoe, together with Oesel, on the coast of Livonia, all of which belong to Russia. The sound, the Great and the Little Belt lead from the Kattegat into the Baltic. The Baltic and North Sea are now connected by the great ship canal constructed between the Elbe, near its mouth, and Kiel Bay, and opened in 1895. The canal is a work of the German government, and is intended for the use of war-vessels as well as trading-ships, many of which, bound to or from Baltic ports, will be able to effect a great saving by means of this water-way. The chief seaports of the Baltic are St. Petersburg, Kronstadt, Riga, Revel, Narva, Libau, in Russia; Stockholm, Gefle, Karlskrona, in Sweden; Memel, Königsberg, Danzig, Stettin, Lübeck, and Kiel, in Germany; Copenhagen, in Denmark.

Bal'timore, Barons of, or Lords Baltimore. See BALTIMORE FAMILY.

Baltimore Family, founders and proprietors of Maryland, consists of seven successive lords of the barony of Baltimore in the Irish peerage, and a cadet who was governor has been added.

GEORGE CALVERT, the first lord: b. 1580, Kipling, near Bolton Castle, Yorkshire; d. 15 April 1632. He graduated from Trinity College, Oxford, 1597; traveled abroad, and after his return became secretary to Sir Robert Cecil (afterward Lord Salisbury), clerk of the Crown in Ireland, 1606, and clerk of the Council, 1608. He assisted James in his controversial writings, had charge of the Spanish and Italian correspondence during the secretary of state's absence in 1613, was on a committee to investigate Irish Catholic grievances the same year, was knighted 1617, and in 1619 was made secretary of state by Buckingham's favor. He represented Yorkshire jointly with Sir Thomas Wentworth (afterward Lord Strafford) in the parliament of 1621, and in the stormy times that followed was a mediator between Parliament and king, with the usual fate of being thought a spy by the one and lukewarm by the other. The French ambassador styled him an honest, sensible, well-intentioned man and zealous patriot, and therefore without influence. He had principal charge of the foreign negotiations while James was chasing the will-o'-the-wisp of the Spanish marriage and making England a nullity in the Thirty Years' war; Calvert's later Catholicism made him suspected as favoring the latter policy, but in fact he wished a more energetic one. On 14 Jan. 1624 he was one of the nine councilors who opposed a breach with Spain. In January 1625 he announced himself a Roman Catholic; his conversion is credited to Gondomar, the famous Spanish ambassador, and Lord Arundel of Wardour, his son's father-in-law. On 12 February he resigned his office and was given the barony of Baltimore; which, as James hated «apostasy,» measures his esteem for Calvert. On the accession of Charles I., in 1625, Baltimore refused, from conscientious scruples, to take the oath of supremacy and abjuration, and Charles gave him a handsome letter to the Lord Deputy of Ireland. In 1627 he was summoned to court to consult on the peace with Spain, but thenceforth took no part in public business, devoting himself to colonization. Already in 1621–2 he had planted a colony in Newfoundland, chartered in 1623 as Avalon; in 1627 and 1628–9 he visited it, but the severe climate disappointed him and he begged for a grant in a milder one. Without waiting for a reply he attempted to explore Virginia for a settlement; but the Jamestown officials of the old Virginia Company refused permission unless he would take the oath above. The region satisfied his ideal, however, and he persisted in asking a grant there against the dissuasions of Charles, who finally assigned him a northeastern tract, now the States of Maryland and Delaware; but the same interests delayed the proceedings, and before the charter was signed, 20 June, Baltimore died. The usual assumption that he intended the colony for a Roman Catholic establishment is not only absurd in itself, as public feeling would not have allowed it to be thought of, but is answered by the fact that the charter established the Church of England and did not even specify toleration for other creeds, which was not made a provision of law till 1649, though of course intended, and proclaimed at once on the establishment of the colony. Baltimore thought — wrongly, as it turned out — that the proprietary's power and the religion of the chosen colonists would prevent the persecution of his own faith, and had neither wish nor power to persecute others. That he meant it as an asylum and breeding-ground for his religion is a matter of course. It was also to be a feudal aristocracy, but with an assembly of freemen whose consent was necessary to the validity of laws. In a word, Baltimore was a conservative of high principles and moderate temper.

CECILIUS, or CECIL CALVERT, the second lord: b. about 1605; d. 30 Nov. 1675. He married Anne Howard, daughter of Lord Arundel of Wardour (after whom Anne Arundel County of Maryland is named), about 1623. The charter of Maryland granted to his father was transferred to him as heritor; but he never visited it during the 43 years of his life thereafter, sending deputies in his place, and managing its business and political affairs judiciously from England, settling disputes of natives or colonists sensibly and placably, and esteemed a worthy successor to his father. Down to the civil war of 1642 he had little to do but support his brother, Leonard, as governor; but his policy then became difficult. He tried to steer a middle course, and avoid either for himself or the colony any pronounced declaration of sympathies or allegiance which might expose it to confiscation; but Ingle's upset of the colonial government (see LEONARD CALVERT), and the parliamentary triumphs at home, showed him at last that this could not be maintained, and that with the Puritans at the head, the Roman Catholic supremacy, though used only to preserve themselves from persecution, must be given up. On 9 June 1647 Leonard died, after appointing as his provisional successor an ardent Churchman and loyalist, Thomas Green; but Lord Baltimore in 1648 appointed Capt. William Stone and had him settle some 500 Puritans, harried by the Vir-

ginia Cavaliers, in Maryland. When the news of the king's death arrived, Green, in Stone's absence, proclaimed Charles II. king, as did Virginia; on which William Claiborne (q.v., and below), the treasurer of Virginia, joined the Parliamentary party, obtained a commission to reduce the two rebellious provinces, and, after overthrowing the Virginia government, forced Gov. Stone to renounce his allegiance to Lord Baltimore and give it to the «keepers of the liberties of England.» When Cromwell dispersed the Long Parliament Stone repudiated the agreement; Claiborne marched against him, deposed him, and appointed a Puritan government which at once most ungratefully disfranchised all Catholics and repealed the colonial toleration act of 1649. In January 1654 Cromwell himself intervened, and forbade the Virginia authorities to molest Lord Baltimore or his officers in Maryland. Baltimore thereupon ordered Stone to overturn the Puritan government, but Stone's force was defeated and himself captured. Baltimore, however, kept his favor with the Puritan administration; the commissioners of plantation decided that the province was his, and in 1658 it was restored to him. Claiborne's influence was at an end, and Baltimore had no further troubles over Maryland.

Leonard Calvert, younger brother of Cecilius, was sent out by the latter as first governor of the new colony: b. about 1606; d. June 1647. He set sail 22 Nov. 1633, in the Ark and the Dove, with about 200 Roman Catholic settlers of good families; arrived 24 Feb. 1634, at Point Comfort, landed 25 March on an island in the Potomac, which they named St. Clement's, and founded on the site of an abandoned Indian village a town, St. Mary's, long since deserted. He met an Englishman, Capt. Henry Fleet, who had lived some years among the Indians, and helped him to gain their consent to the settlement. But he found Kent Island in the Chesapeake, the great island opposite Annapolis, settled by one William Claiborne (q.v.), under a grant from the dissolved Virginia Company, effectively enough to have a representative in the Virginia legislature. Calvert claimed right of property and political jurisdiction over the island, Claiborne denied both, and Virginia upheld him; and the warfare that ensued embroiled the two colonies for many years, complicating itself with the issue of Churchmen against Catholics, then (by the oddest irony of fate) with Cavaliers in Virginia against the Puritans who had overborne the Catholics in Maryland, and finally with a rankling boundary dispute. Claiborne poisoned the Indians' minds against the Marylanders as a set of treacherous Spaniards; Calvert sent an expedition against him, which captured two boats, with mutual loss of life, in April and May 1635. Claiborne had further losses, and became bankrupt, but in 1637 bought of the Indians Palmer's Island, at the head of Chesapeake Bay, as beyond Baltimore's grant, and petitioned for an injunction against Baltimore's interfering with him. The commissioners of plantation refused him the grant, despite his purchase, on the ground that he had only a trading license. Meantime Kent Island continued insubordinate, and Calvert had to make an expedition against it in person, reducing it and occupying Palmer's Island also, and capturing one of Claiborne's lieutenants, who was put to death for piracy and murder in the former troubles. Calvert now undertook to introduce the feudal system contemplated by his father's charter; but as the freemen's consent was necessary to this, and they refused to give it their own abasement, the scheme was blocked and in fact never was carried out. The civil war of 1642 having broken out, cautious steering was needed to avoid risking confiscation from one side or the other, and Calvert went to England to consult his brother, leaving one Brent as deputy; who brought on the very catastrophe dreaded, by seizing a Parliamentary vessel and imprisoning the captain, Richard Ingle. Ingle escaped, obtained letters of marque from Parliament, allied himself with Claiborne, who had been made the treasurer of Virginia for life by the king, but had no politics except for his own hand, and by the time Calvert returned with a new commission in 1644 had possession of the colony and was plundering right and left. Calvert, in an attempt at repossession, was defeated and fled to Virginia, which had remained loyal to the king, and appealed to the colonial government for help; they refused to give it; finally he got a force together, and in December 1646 returned and drove Ingle out — one of the flying rebels, however, carrying off all the early records of the colony, which have never reappeared. He died the next year, leaving an unfortunate provisional appointment of a successor, which made even worse trouble for the colony than the last deputy.

John, the third lord; Charles, the fourth; Benedict, the fifth; Charles, the sixth; and Frederick, the seventh and last, complete the roll. Frederick was a foolish and worthless rake, and perhaps worse. Born in 1731, he died 14 Sept. 1771, leaving no legitimate heirs, but apparently a natural brood of some ability. The proprietary rights in Maryland were bequeathed to a child, Henry Harford, but four years later were rendered worthless by the Revolution.

Baltimore, Md., the chief city of the State, the sixth in population of the United States, and the commercial head of the Atlantic seaboard south of New York: on the Pennsylvania (P., W. & B.), Baltimore & O., W. Maryland, Baltimore & P., Northern Cent., and other R.R.'s.; 38 miles n.e. of Washington, 97 s.w. of Philadelphia.

Topography.— The city is most admirably situated at the head of tide-water on an arm of the great Chesapeake Bay, of most ample proportions and in former times known as «Patapsco Bay,» and that designation is fully justified by its dimensions; 12 miles long by an average of 3 miles wide, forking at the peninsula on which Fort McHenry stands, and thereby creating the land-locked harbor known as the Northwest Branch. This celebrated harbor is noted for the ease with which ships of great burden may be docked or moored at any stage of the tide, the tidal movement being only from 1 foot to 1 foot 6 inches. The ship channel from this inner harbor to the sea has been for many years of sufficient depth to permit the passage of ships drawing 31 feet of water and over to the docks and elevators of the Baltimore & Ohio Railroad on the western side as you enter, and the Pennsylvania Railroad sys-

tem on the eastern side of the harbor. South of the above mentioned peninsula is another wide fork of the greater harbor, known as the Middle Branch, on which are located the great terminals of the Wabash Railroad system; this again forks, receiving the waters of the small Patapsco River and Gwynn's Falls, on either hand.

Through the centre of the city flows a stream which, rising some distance north of the inner harbor, has its fountain-head at springs which flow 500,000 gallons per day. It is known as "Jones' Falls," after David Jones, who built himself a house on its banks about 1680. Over this stream in the city proper have been erected 23 bridges, of which may be mentioned those over Eager, Calvert, North, and Saint Paul streets and Cedar avenue, as beautiful and costly. But the great white marble bridge which spans not only the stream and its valley but crosses over three railroads and carries the roadbed of North avenue is one of the great engineering triumphs of the times, its western abutment embracing the entrance of the Baltimore Railroad to Washington and the South. Massive walls of white marble confine the water of this small Tiber in its passage through the city. On its banks are located the union station of the Pennsylvania Railroad Company, whose grounds bordering on the stream are embellished with tasteful gardens, and the city has beautified the other shore by constructing "sunken" gardens.

The land area of the city in 1888 was 13,202 square acres, of property annexed in 1888 was 16,939 square acres, of the harbor 1,507 square acres, making the total area of the present city 31,648 square acres.

The total mileage of streets and alleys in the city is 546.7, of which 495.8 miles are paved and 50.9 unpaved; of the total miles of paved streets 71.9 miles are paved with cobblestone, 43 with belgian block, 9 with sheet asphalt, 13.5 with asphalt block, 6.1 with vitrified block, 1.8 with mosaic block, 0.6 with wooden block and 49.9 with macadam.

Monuments and Statues.—The first monument erected in Baltimore was in memory of Christopher Columbus and was dedicated 12 Oct. 1792, the 300th anniversary of his landing. It stands in the grounds of the Ready Asylum, on Boundary avenue. One of the grandest monuments in the world stands at the intersection of Mount Vernon and Monument squares—the Washington monument, the erection of which was conceived in the year 1809, the design furnished by Robert Mills, and the cornerstone laid on 4 July 1815. It rises above these squares about 200 feet, and is of the Greek Doric inspiration. The figure of Washington is by Causici.

The next in importance is the "Baltimore Monument," known as the "Battle Monument." It was erected to the memory of those who fell at the battle of North Point in 1814, and is the work of Maximilian Godefroy. It is 52½ feet high. The principal column represents a fasces, upon the bands of which are placed in bronze letters the names of those who fell, the whole being crowned by a female representing the city, holding in her hand a wreath of laurels, capellano.

The Thomas Wildey monument on North Broadway is dedicated to him as the founder of the Order of Odd Fellows, and may be described as a Grecian Doric column 52 feet high, on which stands a figure of Charity. Other monuments are the Wells and McComas monument at Ashland square; that on Federal Hill erected to the gallant soldier Armistead who defended Fort McHenry at the same time, 1814; the monument to the Marylanders who fell in Mexico, located in Mount Royal avenue; the monument at the intersection of Mount Royal avenue and Cathedral street, recording the deeds of the Maryland Line, the only troops who fought from Bunker Hill to Savannah during the Revolution; and the monument, by Ruckstuhl, erected by the Daughters of the Confederacy, to the Confederate soldiers of the state.

Mr. William T. Walters has given the city the famous bronzes of Barye including the great lion, and the masterful bronze by Dubois, "Military Courage"; the sitting statue of Chief Justice of the United States, Roger Brooke Taney (q.v.) in his official robes; and the equestrian statue of John Eager Howard (q.v.).

Public Buildings.—First in municipal importance, though possibly not in the cost or beauty of design, is the city hall, built of Maryland white marble, the style of architecture being the Renaissance. Cost of construction $2,271,135.64; cost of furnishing $104,264.79. The new court-house is 200 feet front by 325 feet depth. The material is white Maryland marble, and the architectural style is a free Renaissance treatment of the Ionic order. The cost of this building completed was $2,753,003.18. The post-office, located opposite the court-house, is also a recent erection, Italian in general treatment. The building contains the United States and District courts. The cost was $2,011,835. The new custom-house is not yet completed, but will be a most beautiful addition to the great public buildings. Its cost will be several millions dollars.

Educational Institutions, Art Galleries, Libraries, etc.—The Maryland Institute of Art and Design, which was for many years in the heart of the commercial centre of the city, was incorporated in 1826. The library contains 20,000 volumes, relating to the arts and sciences. The new home of this school is located on Mount Royal avenue. It has been most liberally endowed by the Jenkins family of Baltimore, and Andrew Carnegie. The Academy of Sciences, located in the fine old mansion of ex-Governor and ex-Senator Thomas Swann, on West Franklin street, contains a large collection of the bird life of this country, and a large collection of Indian remains. The Peabody Institute (q.v.), a white marble building standing within the shadow of the Washington monument, is a donation from the philanthropist George Peabody (q.v.). It contains a large reference library, an academy of music and a gallery of art. The entire building is 170 by 150 feet. The library room accommodates about 300,000 volumes.

The Walters Art Gallery, located within 100 yards of the last named institution, contains the finest private collection of paintings and ceramics in the United States, and also a special collection of ancient arms and armor and lacquer

work of the Japanese. In the same block, southeast of the original gallery and on the corner of Centre street and Washington place, is now being erected an art gallery for the Walters Collection of Old Masters, recently purchased by Mr. Harry Walters, at a cost of $1,000,000.

The Enoch Pratt Free Libraries, of which the city has six, were the free gift of Enoch Pratt (q.v.). The central library is located on West Mulberry street, near the centre of the city. It has six branch libraries and some substations. Other libraries are the Maryland Historical, the Peabody reference library, those of the Maryland Institute, the Maryland Episcopal Diocese, the Bar Association, the Archbishop's, Odd Fellows, New Mercantile, Baltimore & Ohio Employees' Free Circulating, and others.

The Johns Hopkins University (q.v.) makes no pretensions in the way of architecture, McCoy hall being possibly the most imposing edifice so far erected. The new home of this great school will leave nothing to be desired. Placed at an elevation of some 300 feet and occupying the estate of one of the Carroll family, known as "Homewood Park," it overlooks the city and harbor. On North Broadway, facing the west, stands the group of buildings known as the Johns Hopkins Hospital. The architectural appearance of the central group of buildings is majestic, standing 114 feet above tide. The cost of the original buildings was $2,250,000, which has been very largely added to since the founding. Other medical schools are those of the University of Maryland (1807), the College of Physicians and Surgeons, and the Baltimore Medical College. The oldest dental college in the world is the Baltimore College of Dentistry and Surgery, chartered 1839. The chief law school is that of the University of Maryland.

The Woman's College (Methodist Episcopal, 1888) is another institution of which the citizens are proud. The buildings are throughout in the Romanesque style, of the Lombard variety, with adaptations from that order to which Vitruvius gave the name Tuscan. They are built of dark undressed granite and are surmounted by roofs of Roman-red tiles. The church is the most southern member of the group of buildings, its massive tower the most conspicuous object in the northern part of the city. This tower is almost an exact counterpart of a campanile to be seen just outside of the city of Ravenna, Italy. There are also many other colleges and preparatory schools of good rank, making the city a leading educational centre. Among these are Morgan College (Methodist Episcopal, 1876); Baltimore City College; Bryn Mawr School (1885); and four Roman Catholic institutions—St. Mary's (Seminary of St. Sulpice, 1791); Loyola (1852), under Jesuit management; Notre Dame of Maryland (1873); St. Joseph's (1888). The public school system has about 118 schools, 1,750 teachers, and 75,000 pupils, and about $1,200,000 is annually expended in its support. The first manual-training schools for white or colored pupils were established here. There is also a State Normal School and an institution for training colored teachers.

Parks and Cemeteries.—The beautiful Druid Hill Park consists of 671.2 acres. Other parks are: Clifton Park, 252.07 acres; Clifton Lake, 44 acres; Patterson Park, 106 acres; Carroll Park, 83 acres; Riverside Park, 17.02 acres; Federal Hill Park, 8.02 acres; Wyman Park, 132.08 acres; Swann Park, 11.03 acres; Latrobe Park, 10.05 acres; Gwynn's Falls, 57 acres, besides 32 small squares dispersed all over the city, containing 58.12 acres, making a grand total of about 1,450 acres. In natural beauty Druid Hill Park is unsurpassed by any in the world. It is filled with springs of pure water, some of which are medicinal. A great artificial lake, a part of the city's waterworks, with a depth of more than 80 feet, occupies many acres, and around it has been constructed a fine drive. Near the head of this lake on the driveway stands the colossal statue of the Scottish hero, Sir William Wallace. In the rear of this is the full-length marble statue of Washington, executed by Bartholomew. A short distance from the latter is a costly and graceful pedestal surmounted by a life-size figure of Christopher Columbus, by Achille Canessa.

Patterson Park, on the eastern rim of the city, contains 106 acres, overlooks the harbor and still retains some of the earthworks thrown up by the American Army in the defence of the city 1812-14, some of the guns being still in position.

The various churches maintain 62 cemeteries, many of them on the outskirts of the city proper, but on various lines of electric car service. Nine of these cemeteries are Hebrew and four negro. The largest is Baltimore cemetery, in the extreme northeast near Clifton Park; the most beautiful are Greenmount in the north centre, containing the McDonough monument, and Loudon Park in the extreme west. Near the latter is Mount Olivet. Saint Peter's (Roman Catholic) is on the northwest.

Churches.—There are some 489 church buildings in the city, many of great beauty both externally and internally; notably the First Presbyterian church on Madison street, with its wonderful Gothic spire 300 feet high; the Mount Vernon Methodist Episcopal church within the shadow of the Washington monument, and the Roman Catholic cathedral commenced in 1800. The style and decorations of the last named are of the Grecian-Ionic order. The great dome is 207 feet in circumference internally, and 231 feet externally. The side aisles in the church are terminated by two pictures. That on the right is the "Descent from the Cross," painted by Pauline Guerin—a present from Louis XVI. to the archbishop—and that on the left, "St. Louis Burying his Officers and Soldiers Slain Before Acre," the work of Steuben, and presented by King Charles X. of France. There are also the stately Methodist church described with the Woman's College; the beautiful white marble synagogue, Oheb Shalom, on Eutaw Place, oriental in style, and a short distance away the great Har Sinai temple on Bolton street, and the Byzantine temple on Madison avenue. The Episcopalians have many fine churches, among them Saint Paul's on Charles street, and Grace church on Monument street.

The following is a list of the churches of the various denominations: Baptist, 59; Christian Science, 2; Congregational, 4; Disciples of Christ, 7; Evangelical Ass'n, 4; Evangelical Lutheran, 57; Friends, 2; Orthodox, 2; Independent Roman Catholics, 1; Independent Ger-

1. Cathedral.

2. Battle Monument.

man, 1; Jewish Synagogues, 22; Methodists of various kinds and color, 119; New Jerusalem, 1; Ark of the Covenant, 1; Presbyterian, 33; Protestant Episcopal, 45; Reformed Church, 14; Reformed Episcopal, 43; Roman Catholic, 55; Seventh Day Adventists, 2; Swedenborgian, 3; Union Evangelical, 3; Unitarian, 1; United Brethren in Christ, 7; Universalist, 1; total 489.

Clubs.—Baltimore cannot be called a club city; however, the time-honored Maryland Club is a great social organization occupying a superb new building on Charles and Eager streets. There are also the younger Baltimore Club, on Charles street, opposite, composed largely of the sons of members of the Maryland Club; the Catholic Club; the Charcoal Club; Germania Club, for German merchants; the Merchants' Club and the Phœnix Club, a refined Jewish organization.

Charitable Institutions.—The city has a body of gentlemen, known as Supervisors of City Charities, who serve without pay, and who look into every form of charity and direct to a large extent its distribution. There is also a State Board of Charities, non-paid. Among the institutions to aid suffering humanity are Johns Hopkins Hospital (already mentioned), Maryland Hospital for the Insane; Female House of Refuge; Springfield State Hospital; House of Refuge (male); Aged Men's Home; All Saints Home for Children; Augusburg Home; Baltimore Association for the Improvement of the Condition of the Children of the Poor; Baltimore Orphan Asylum (more than 100 years old); Boys' Home Society; Briska Help Association; Charity Organization Society; Christian Tribune Home for Young Ladies; Dolan Children's Aid Society; Egenton Female Orphan Asylum and School; Female Christian Home; and Free Summer Excursion Society. The various charitable institutions are too numerous to mention all by name, but among them are the blind asylum, a fine white marble building; and the city almshouse, accommodating 1,300 inmates.

Water and Fire Departments.—The city owns its waterworks system, which is self-sustaining. There are 645 miles of water mains in the city. The water comes from two sources: (1) the Big Gunpowder River, average daily flow 170,000,000 gallons; (2) Jones' Falls, 35,000,000 gallons. The service has two impounding reservoirs—Loch Raven on the Gunpowder River, capacity 410,000,000 gallons, and Lake Roland in the bed of Jones' Falls, capacity 400,000,000 gallons. The department has two stand pipes with a maximum capacity of 300,000 gallons. The expenses of the fire department are about $600,000 per annum. Equipment: 29 engine companies, 14 hook and ladder companies (one of the engine companies is double—two engines and one tower; one is a powerful fireboat).

Transportation.—Baltimore has a very modern and excellent street car service; it can boast of the fact that it had the first electric sreet railway and the first electric elevated railway in the world. The street railways have about 400 miles of rails now being operated on the streets and suburban points within the radius of its operations. More are contemplated. The Delaware and Chesapeake ship canal, across the narrow strip of Delaware, gives it a direct water outlet to Philadelphia. The Baltimore & Ohio Railroad system (q.v.) follows almost without change the route of the old national pike, which extended from Baltimore to Saint Louis; it was the first road to the Atlantic seacoast and the corner stone was laid 4 July 1828. The facilities provided by this road are the great terminals located at Locust Point, consisting of freight sheds, elevators, and the proper loading docks with a depth of 30 feet in 1906, but now being enlarged to 35 feet, connecting with the ship channel to the sea of the same depth. Within the last two years they have erected an emigration pier and necessary buildings.

The terminals of the Pennsylvania Railroad are on the opposite side of the harbor from the B. & O. terminals, or, in other words, the eastern side. They have the same depth of water in the freight slips and have direct communication with the 35-foot channel. The principal road of this system passing through this city is the Philadelphia, Baltimore & Washington Railroad, and its branches. Running a little west of south from this city is still another important feeder, the Baltimore & Potomac Railroad, which passes through Washington, terminates at Quantico, Va., branching at Bowie, Md. The Board of Trade had much to do with the introduction of another great railway system into this city, in the matter of the sale of the city's interest in the Western Maryland Railroad to what was known as the "Fuller Syndicate" together with the purchase of the Pittsburg and West Virginia Central and the acquisition of the Wabash system. The Baltimore & Potomac has a tunnel 7,400 feet long through the west side of the city; the Northern Central one 3,500 feet long through the northeast; the Baltimore & Ohio one 1 2-3 miles long through the city north to south. The Baltimore & Ohio road draws its trains through by electric motors. Twenty-one steamship lines use the docks and piers of the Baltimore & Ohio Railroad or the Pennsylvania Railroad Co. These lines run to Europe and South America and other ports. Besides these there are steamship lines to Boston, Halifax, Providence, New York, Wilmington, N. C., Charleston, Savannah, New Orleans, etc.; and steamboat lines to Philadelphia, Washington, Norfolk, Richmond, and other points on the bay and its tributaries. There are 8 or 10 coasting lines on the bay alone, chief of them the Old Bay Line to Norfolk.

Commerce.—The report of R. L. Hoxie, United States engineer in charge of the harbor improvements, speaking of the year 1905, says that there was an increase of imports over the year previous of $852,440, and that 249,376 tons of grain, 266,109 tons of coal, 272,421 tons of iron and steel, and 120,000 tons of oils were exported. Exports from the port of Baltimore during the fiscal year from 1 July 1904 to 30 June 1905, were valued at $91,172,888; during the fiscal year from 1 July 1905 to 30 June 1906, $109,801,118. Imports for the same period 1905, free, $12,488.992; dutiable $8,692,247; total $21,-181,239; 1906, free $14,318,075; dutiable $16,336,-942; total $30,655,017; total increase $9,473,778.

Baltimore is the foremost corn-exporting port in the country, handling an average of 40,-000,000 bushels a year, with 20,000,000 of other

grain; one of the first in flour, handling about 3,500,000 barrels; it also sends out enormous amounts of other provisions, live stock, tobacco, boots and shoes, coal, naphtha, drain-pipe, copper, etc. Its imports are copper (mainly to be re-exported), iron and manganese ores, cotton, coffee, West India products, etc.

During the year 1905 there were 80 sailing vessels of 42,502 tons, and 638 steam vessels of 1,182,458 tons entered at the port, and the clearances comprised 63 sailing vessels of 27,228 tons and 627 steam vessels of 1,222,470 tons.

Manufactures.— The official figures for Baltimore in 1905 were as follows: total number of establishments, 2,162; capital, $148,106,726; number of salaried officials, clerks, etc., 6,766; salaries, $7,001,232; number of wage-earners, 65,013; wages, $25,548,343; miscellaneous expenses, $18,855,372; cost of materials used, $80,184,704; value of products, including custom work and repairing, $150,248,021. Among the numerous industries in which the city stands in the front line of the big cities of the United States, the ready-made clothing business shows one of the greatest increases since the big fire of 1904. The business has increased, according to prominent manufacturers, at least 25 per cent, and is now worth about $18,000,000 to the city. There are about 40 factories in Baltimore manufacturing men and youth's clothing. They employ from 10,000 to 12,000 hands, and pay out in salaries yearly from $5,000,000 to $6,000,000. Other important industries are besides bread, shirts, carpenter and mason work, etc., tobacco products, canning of fruits and vegetables, canning of oysters, foundry and machine-shop work, slaughtering and meat-packing, fertilizers, malt liquors, furniture, confectionery, lumber and planing-mill products, etc.

Finances, Banking, etc.— The estimated basis of taxation for 1906 was $548,522,063; additional real estate assessments involving easements, $23,350,000. The funded debt of the city 1 Jan. 1906 was $43,313,182.95; productive assets, $25,586,690.45; unproductive assets, $20,000,000. The clearing house transactions average about $1,200,000,000, the total for 1905 being $1,249,411,909. On 18 June 1906 there were 18 National banks, with a capital of $12,590,700, surplus $6,510,800, undivided profits $2,204,426.85, and total deposits of $74,404,338.37. There are also a large number of state and private banks and loan and trust companies. Baltimore is the great United States centre of the fidelity and security business; its trust, bonding and surety companies have an aggregate capital of $15,531,250, surplus and undivided profits of nearly $25,000,000 and deposits of about the same amount.

Government.— The charter provides that «the executive power of the mayor and city council of Baltimore shall be vested in the mayor, the departments, sub-departments, and municipal officers not embraced in a department herein provided for, and such special commissioners or boards as may hereafter be provided for by laws, or ordinances not inconsistent with this article.» The mayor holds office for four years; he has a veto which can be overridden by a three-fourths vote of the council, which is composed of two branches; the lower, of 22 members, one from each ward; the upper, of 11 members, each from two contiguous wards. The bulk of the city officers are appointed by the mayor with the consent of the higher branch. The council has the right to appoint the city register and public printer; and the comptroller and surveyor are elected by popular vote.

The principal city officials are the comptroller (head of department of finance); city register; board of estimates; commissioners of finance; city collector; collector of water rents and licenses. The chief departments are public safety (fire, health, buildings, and street cleaning), public improvements, parks, and squares, education, charities, and corrections, and review and assessments.

Population.— The city stands sixth in population among the cities of the United States, the growth being as follows: (1775) 5,934; (1790 first U. S. census) 15,530; (1800) 26,514; (1810) 46,454; (1820) 62,738; (1830) 80,620; (1840) 102,513; (1850) 169,054; (1860) 212,418; (1870) 262,854; (1880) 332,313; (1890) 434,439; (1900) 508,957. The police census of March 1906 makes the population 543,034, with two large cities only separated by a curb line on the eastern boundary, containing about 50,000 inhabitants. They cannot, however, be counted because they are part of Baltimore county.

History.— The first settlement of land included in the present site of Baltimore was made in 1662. Charles II. was King of England, and Charles Calvert Governor of the province. The English people had been making history very fast, and among their most brilliant achievements was the planting of successful colonies in various parts of the world, notably the Virginia colony, the Massachusetts plantations and the province of Maryland, founded in 1634. So that the first actual settlement on land, within the present city limits, was made only 28 years after the landing of the first colonists at Saint Mary's.

During the 17th century we find statute books burdened with many laws creating town after town on paper, as many as 33 having been created, three of them being within the boundary of what was then called Baltimore county. By the act of the General Assembly of 1706 a town was to be established on Whetstone Neck on the Patapsco river. No name was given to the town in the act. Another town, called Baltimore, was located near the mouth of Bush river on its eastern side. This town is shown in the map made by Augustus Herrman, the Bohemian, in 1670, and some 14 years after the actual founding of the present city, the General Assembly ordered another Baltimore to be laid out on Indian river in Worcester county. Nothing was ever done in regard to this last town, the county surveyor refusing to proceed with the work.

Then came the true founding of the city of Baltimore, by the passage of an act entitled «An act for erecting a town on the north side of Patapsco, in Baltimore county, and for laying out in lots of 60 acres of land in and about the place where one John Flemming now lives.» (1729, chapter 12.) About two years after the founding of Baltimore town an act was passed entitled «An act for erecting a town on a creek, divided on the east from the town lately

1. Washington Monument.
2. Johns Hopkins Hospital.

laid out in Baltimore county, called 'Baltimore Town,' on the land whereon Edward Fell keeps a store." (1732, c. 14.)

The next step for the enlargement of the original town was the passage by the General Assembly of the act of 1745, c. 9, 15 years after the founding. This act was passed on the joint petition of the inhabitants of Baltimore and Jones's Town, that the two towns be incorporated into one entire town, and for the future to be called and known by the name Baltimore Town and by no other name. The town was again enlarged two years later by the act of 1747, c. 21, on petition of the inhabitants by the addition of 18 acres, which were not included in Jones's Town nor in Baltimore Town. In 1765 another addition to the town was made on petition of Cornelius Howard and other persons, consisting of 35 acres on the west and south sides of the town. The town was again enlarged by the act of June 1773, by the addition of 80 acres on the east and southeast.

The Revolution brought it prosperity by crippling its rivals, and it was a great seat of privateering. For a couple of months in 1776-7 Congress held session in one of its taverns, having fled from Philadelphia in fear of the English. About this period the energy and resources of a couple of immigrant Scotch-Irishmen, the brothers John and Henry Stevenson, began to push the place forward; new stage and packet lines were established, the roads improved and turnpikes laid out, and Jones's Falls diked and part of its course filled in. The European wars of the French Revolution and later threw a large part of the world's carrying-trade, till Napoleon's downfall, into American hands; the "Baltimore clippers" were famous everywhere. In 1792 a large body of French refugees from Haiti came in. On 31 Dec. 1796 the old settlement of Fells' Point was united with it, and it received a city charter, it having previously been governed from Annapolis. In the War of 1812 it again became a seat of privateers, in revenge for which the British attempted its capture in 1814, but the attack was repulsed 12 Sept. To it we owe the "Star-Spangled Banner" (see Key, Francis Scott) and the Battle Monument. The end of the Napoleonic wars in 1815, restoring to England her old carrying trade, was a heavy blow to Baltimore. In 1828 the public-school system was established. In 1860 all three anti-Republican parties held their national conventions there; and on the outbreak of the Civil War the Union troops passing through there were mobbed by the citizens, and the first blood of the war was shed in its streets, 19 April 1861. On 23 May Federal Hill was occupied by a Union force, and the city remained under martial law till the end of the war. The convention of 1864, which renominated Lincoln, was held here. In 1888 "The Annex" was annexed to the city, extending its limits two miles north and west, and nearly doubling its size. Since 1890 Roland Park and Walbrook have also been annexed.

The greatest disaster which Baltimore has experienced was the conflagration which commenced on Sunday 7 Feb. 1904, and continued to burn until the 9th. Some fire was not extinguished for a year. It commenced in the largest wholesale dry goods establishment in the city—Messrs. John E. Hurst & Co.—the building having three fronts. According to the statement of the *Baltimore Sun* "A strong wind was blowing from the southwest, and within about an hour, eight or ten buildings on Hopkins Place in the neighborhood were in flames. The fire spread to the north and east, rapidly devouring block after block of buildings. As many as ten blocks were in flames by nightfall, notwithstanding the extreme exertions of the firemen. By 8 o'clock the wind shifted and blew the fire, which had at that time acquired a volume of its own, straight down Lombard, German, Baltimore, and Fayette streets. In the effort to stay the progress of the flames, dynamite was used in ten places, or more, but the blowing up of houses had no good effect. Landmark after landmark went down. The lofty 'sky-scrapers' on Charles, Saint Paul, Calvert, and Baltimore streets and the solid brick structure, the B. & O. Central building, and the Equitable and Calvert buildings burned like great torches high up in the air. A fortunate change of the wind about midnight, helped to save the magnificent row of public buildings on the north side of Fayette street, from Saint Paul street to Holliday street—the court-house, the post-office and the city hall, but before the change occurred flying embers set fire to blocks on the south side of Baltimore street below Gay street, and to the Maryland Institute and the Marsh Market. The change carried the flames towards the water and the docks on the south, while on Baltimore street the fire stopped at Jones' Falls." The loss was estimated at about $70,000,000.

Throughout the whole period of acute distress there was no looting and no undue excitement; perfect order was maintained and the business firms and companies resumed operations in temporary quarters with comparatively little or no interruption, while the city and State governments addressed themselves, actively and intelligently, to the ways and means of speedy rehabilitation.

In addition to the local fire-fighting force, companies from other cities came to their aid as follows: Washington, D. C., 5; Baltimore Co., 4; Sparrows Point, 1; Annapolis, 1; Philadelphia, 7; York, Pa., 2; Harrisburg, Pa., 1; Chester Pa., 1; Altoona, Pa., 1; New York City 10; Wilmington, Del., 4. There was thus engaged in fighting the Baltimore fire an average of 62 well equipped modern fire organizations and they all had abundant water from the city's sources of supply.

In the banking and financial centres of the fire-swept area the greatest anxiety prevailed for several days in regard to the safety of the securities and books in the vaults of these institutions. Time locks prevented the opening of the vault doors on Sunday night and the next morning when the bank buildings were in ruins it was known that in ten of the National banks and in one other, there were values of $53,000,000 including loans and discounts, securities, clearing-house exchanges, and cash. These banks represented about $50,000,000 of deposits. In addition to this, the Savings Bank of Baltimore, at the corner of Gay and Second streets, had in its vaults in jeopardy about $25,000,000;

The Hopkins Savings Bank $6,000,000, and others equally large sums. But the vaults stood the fire test for which in part they were designed. As one by one they were opened it was found that their contents were preserved and this fortunate circumstance encouraged them all around, and enabled them to give the necessary aid in the great work of rehabilitation plans which were immediately begun. There were also a number of private banking houses and many brokers involved in the fire, but in all cases it is believed the fire did not reach their valuables. There were thousands of depositors in the savings banks, and financial anxiety extended to nearly every home in the city until the glad news was spread abroad that the bank vaults held good. This was also the case with many safes in commercial and business houses, though for weeks after the fire the streets were strewn with wrecks that failed in the fire and were valueless even as scrap-iron. Consult Love, 'Baltimore: The Old Town and the Modern City' (Baltimore 1895); Scharf, 'The Chronicles of Baltimore' (Baltimore 1874); Thomas, 'The City Government of Baltimore,' in 'Johns Hopkins University Studies, Historical and Political Science' (1896).

WILLIAM H. LOVE,
Secretary of the Board of Trade.

Baltimore Councils. See CATHOLIC CHURCH.

Baltimore and Ohio Railroad, The. *History.*—The fact that the only use of rails for locomotion in 1827 on either side of the Atlantic was for coal carrying, renders the more remarkable the action of the coterie of merchants and bankers of Baltimore, gathering at Philip Thomas' house on the evening of 18 February of that year, in deciding to proceed forthwith to build a railroad for general purposes. The Ohio, at Wheeling, was made the objective point; the intervening Blue Ridge and Alleghany mountains evidently suggesting no difficulties that could not be surmounted. But a week elapsed from the time of the initial meeting to the second, at which the committee appointed at the first reported the resolution, namely: "That immediate application be made to the Legislature of Maryland for an act incorporating a joint stock company to be styled the Baltimore and Ohio Railroad Company, and clothing such company with all powers necessary for the construction of a railroad with two or more sets of rails from the City of Baltimore to the Ohio River." The capital stock was fixed at $5,000,000.

The Baltimore and Ohio's charter, granted of date 28 Feb. 1827, was the first anywhere coming into existence defining and authorizing procedure to completion. Under it the Baltimore and Ohio Railroad Company is still acting, being the only enactment of the character of the pioneer days of the railroad in this country or Europe remaining fully operative; the B. & O. being the single railroad company of those times yet retaining, unchanged, its original name and organization.

On 23 April 1827 the Baltimore and Ohio Railroad Company was formally organized, Philip E. Thomas elected president, and George Brown treasurer. Preparations were immediately inaugurated to secure a survey of the proposed line, the measures to which end were begun on 2 July. In this the United States governmental authorities were induced to co-operate to the extent of relieving Colonel Stephen H. Long, of the Topographical Corps, from his regular duties, who, with Jonathan Knight, a Quaker civil engineer of repute, forthwith proceeded with the actual work, the date of its formal commencement being 20 November. On 5 April 1828 they submitted the result of their labor to that period; and the line west to the Patapsco and thence via its valley to Point of Rocks on the Potomac was decided upon as the first section to be undertaken.

But persistent, bitter, and vehement opposition by the canal authorities was encountered and this was even carried to legislative chambers and the courts, but despite this trouble and a few adverse decisions by the courts, the Baltimore and Ohio pushed on from Baltimore west, and three miles were completed and experimented upon early in 1829. On 22 May 1830 the first section of the Baltimore and Ohio —that from Baltimore to Ellicott City, a distance of 14 miles—was formally opened for public use. Horse-power was the standard means of locomotion pending development of the locomotive to a more assuring stage than then reached anywhere from whence reliable information could be obtained. (See LOCOMOTIVE, THE.) "Brigades of cars" were announced to run three times each way daily, the fare named at 25 cents and business commenced in earnest. This was four months in advance of the formal opening of the Liverpool and Manchester, the first railway abroad for general purposes, its date being 15 Sept. 1830.

Many difficult problems in the mechanics of railroading were decisively solved. Car wheels were first made with the flange on the inside edge, but their causing so many derailments and so frequently breaking led to the change of the flange to the outer edge. But this increased the difficulty on the curves and the conical flange was invented. The anti-friction box on the axles and the practice of placing on the outside instead of the inside of the wheels were both first introduced by Winans; as was also the eight-wheel car. When the main line of the Baltimore and Ohio was completed its roadbed embodied the highest engineering skill of the period in the traversing of mountain ranges; was the longest continuous railroad in the world, with the greatest bridges, trestles and tunnels. Its track construction throughout, and especially its manner of meeting the curvature and providing against slides from the environing mountain sides were lessons in line construction and operation the whole world availed of.

The Baltimore and Ohio was completed to Frederick, 61 miles, 1 Dec. 1831; to Point of Rocks, 69 miles, 1 April 1832; and to Harper's Ferry, 81 miles, 1 Dec. 1834. The initial move toward Washington was the letting of the contract in May 1833, for the construction of the Thomas Viaduct spanning the Patapsco at Relay. This remarkable granite structure, designed and erected under the personal supervision of Benjamin H. Latrobe, was built for the carrying of six to seven ton engines drawing from 15 to 20 ton trains, and meets with equal safety the demand of 170 ton locomotives at the head of 12 to 15 hundred ton trains. It was the marvel in the world's railway circles when con-

structed. The longest, highest, and generally most imposing railroad crossing known, it was the first on a curve and regarded, therefore, as the boldest of departures from the rule.

Two years were required to complete the Washington branch, and it was not until 25 Aug. 1835 that the echoes of the national capital resounded back the locomotive's shrill awakening. With the opening of the branch, the railway postal service came into being, its earliest form the boarded-up end of a baggage car, the two keys to which were held by the postmasters of Washington and Baltimore. The declaration of the first railroad dividend in history, a semi-annual of the Baltimore and Ohio, was made simultaneously with the opening of the Washington branch, and the securities of the latter were the first of American railway issue marketed abroad.

The greatest of eventualities, however, with which the Washington branch's history is linked was the birth of the telegraph. "What Hath God Wrought," the first four words transmitted by wire over a public line, were sent from Baltimore to Washington via the roadbed of the Baltimore and Ohio branch.

Hancock, 123 miles from Baltimore, was reached by the Baltimore and Ohio on 1 June 1842; Cumberland, 178 miles, on 5 Nov. 1842; Piedmont, 206 miles, on 21 July 1851; Fairmont, 302 miles, on 22 June 1852; and the last spike, finishing the great undertaking from Baltimore to Wheeling, 379 miles, was driven on 24 Dec. 1852. The formal opening of the road was marked by a notable demonstration 10 Jan. 1853. There being no rail connection beyond, and the prospects bright for Cincinnati and Louisville business in the one direction and Pittsburg in the other, a company was organized and a daily steamboat service established, "superior to anything floating upon western waters."

With the completion of the Parkersburg branch from Grafton — or the mouth of Three Forks, as it was then known — to Parkersburg, 1 May 1857, the Ohio was reached at another point, and a very important one, as through rail connection had been perfected thence to Cincinnati, 10 days before, 20 April. The opening of the Parkersburg bridge, 7 Jan. 1871, was the last link in the continuous rail from the Chesapeake to the Mississippi.

The old Marietta and Cincinnati, the Ohio and Mississippi and other railways, once separately conducted companies, long since became component parts of the Baltimore and Ohio System, which, with the finishing of the Chicago division, 10 Nov. 1874, has been of the foremost in the metropolis of the northwest, as, through being the pioneer into Cincinnati and Saint Louis from the east, it has ever been in those centres of the southwest.

At Pittsburg, as well, the Baltimore and Ohio's position is a commanding one. Reaching the great central point from Cumberland in July 1860, later building and acquisitions led to radiating lines to Cleveland, Chicago, Cincinnati, Wheeling, and other points of traffic concentration. Eastward from Baltimore the construction of the extension to Philadelphia and its opening, 19 Sept. 1886, together with security holdings in lines through to New York, assured important place among the railways centring in the country's leading city.

Mileage.— On 30 June 1905 the Baltimore and Ohio Railroad proper consisted of the following lines:

DIVISION	MILES
Baltimore and New York	5.34
Main Line System (excluding Valley Railroad of Virginia)	1,052.18
Wheeling System (excluding Wheeling Terminal and Valley and Branches; Cleveland, Lorain & Wheeling and Branches; Ohio & Little Kanawha; and Ravenswood, Spencer & Glenville)	752.60
Pittsburg System	947.73
Chicago Division	282.47
Baltimore & Ohio Southwestern System	985.66
	4,025.98

The lines controlled by or affiliated in interest with the Baltimore and Ohio System were as follows:

	MILES.
Valley Railroad of Virginia	62.12
Ravenswood, Spencer & Glenville Railway	32.40
Cleveland Terminal & Valley Railroad	92.72
Cleveland, Lorain & Wheeling Railway	194.28
Ohio & Little Kanawha Railroad	74.26
	455.78

Making a total of 4,481.76 miles for the entire system. By divisions this mileage is as follows:

	MILES	TOTAL
GRAND DIVISION — NEW YORK		5.34
New York Division	5.34	
MAIN LINE SYSTEM		1,114.30
Philadelphia Division	125.14	
Baltimore Division	227.98	
Cumberland Division	257.42	
Shenandoah Division	112.55	
Monogah Division	391.21	
WHEELING SYSTEM		1,146.22
Wheeling Division	143.39	
Ohio River Division	326.14	
Cleveland Division	244.68	
Newark Division	432.05	
PITTSBURG SYSTEM		947.73
Connellsville Division	308.01	
Pittsburg Division	356.93	
New Castle Division	282.79	
GRAND DIVISION — CHICAGO		282.47
Chicago Division	282.47	
B. & O. SOUTHWESTERN SYSTEM		985.66
Ohio Division	336.40	
Indiana Division	254.53	
Illinois Division	394.73	
Grand total for entire B. & O. System		4,481.76

Equipment.— The total equipment for the entire system, valued at $50,662,723.98, as of 30 June 1905 was as follows:

ROLLING STOCK	
Locomotives and Spare Tenders	1,798
Passenger Cars	1,206
Freight Cars	80,338
Service Cars	1,950
MARINE	
Steam Lighters and Tugs	12
Barges, Floats and Scows	106
Pile Drivers	3
Wharf Boat	1

Traffic Statistics.— For the year ending 30 June 1905 the total number of tons of freight carried by the B. & O. System was 56,322,085, divided as follows: B. & O. lines, 47,285,183, and affiliated lines 9,036,902. The total ton mileage was 9,637,865,455. The number of passengers carried was 16,581,666, or 728,748,125 passengers one mile, divided as follows: B. & O. lines, 15,518,372, and affiliated lines 1,063,294. The freight earnings for the B. & O. lines were $50,607,087.44 and the passenger earnings were $13,817,141.38.

Finances.— The general income account of the B. & O. Railroad Company (including the

B. & O. S. W. R.R.) for the year ending 30 June 1905, was as follows:

Gross earnings	$67,689,997.13
Operating expenses	44,710,603.58
Net earnings from operations	$22,979,393.55
Other income	2,976,998.44
	$25,956,391.99
Total payments	20,289,197.74
Surplus	$ 5,667,194.25

The operating results of the lines controlled or affiliated in interest with the B. & O. System were as follows:

Gross earnings	$4,849,449.03
Operating expenses	3,729,191.43
Net earnings	$1,120,257.60

The capital stock (preferred and common) outstanding on 30 June 1905 was $184,258,524.31; the funded debt was $234,395,430; and the capital liabilities assumed were $11,211,043.83; making the total capital liabilities $429,864,998.14. The capital assets of the company were $373,325,909.03, consisting of the following: Cost of road, $144,974,687.40; bonds and stocks held by trustees, $164,662,516.29; real estate, $12,315,832.78; gas and electric plants, $710,148.58; equipment, $50,662,723.98. The company also owned bonds and stocks of railroad and other corporations to the value of $43,548,658.87.

Baltimore Oriole. See ORIOLE.

Baltimore, Woman's College of. See WOMAN'S COLLEGE OF BALTIMORE.

Baltistan, bäl-te-stän', or **Little Tibet,** an elevated plateau through which the upper Indus flows. It lies below the Kara-Korum Mountains and the Himalayas, with a mean elevation of 11,000 feet, and contains the nameless peak marked K^2, 28,278 feet high, next to Everest, the highest on the globe. It is politically a part of Kashmir.

Baluchi, ba-loo'chē, the language of Baluchistan, one of the Iranian group of languages. There are two dialects, the North Baluchi, and the South Baluchi, or Maprani · the latter shows more ancient features.

Baluchistan, bä-loo'che-stän', a country in the south of Asia, lying between Persia and the valley of the Indus, having the former on the west, Afghanistan on the north, Scinde on the east, and the Arabian Sea on the south; area, about 134,000 square miles. It is wholly under British influence and partly under British rule, while the Khan of Kelat is ruler of a considerable portion, and certain tribes are independent. The general surface of Baluchistan is rugged and mountainous, with some extensive intervals of barren sandy deserts. In the case of the principal ranges, the general parallelism and uniformity of their formation are somewhat remarkable, one system having an inclination from north to south, another from east to west. Many of these mountains are of great height and are covered with snow. There are several broad and high table-lands, extremely cold in winter and extremely hot in summer. Mekran in the south, the ancient Gedrosia, is one of the hottest regions of the globe. Some of the mountain chains are of compact limestone, enclosing marine shells and corals identical with similar objects picked up on the sea-shores at this day. Excepting fragments of quartz found in Lus, primary formations have not been observed in any part of the Baluchistan Mountains. The mineral wealth of the country is believed to be considerable, including gold, silver, lead, iron, copper, many kinds of mineral salts, and saltpetre. Throughout Baluchistan there is a great deficiency of water, particularly in summer. In the northeast part are the rivers Bolan and Mula, the courses of which form the celebrated passes bearing their names, leading from the valley of the Indus to Baluchistan and Afghanistan. The soil is not in general fertile, but by patient industry the plains and valleys can be made productive in wheat, barley, and millet. The other chief crops are madder, cotton, particularly in Cutch Gundava, rice, indigo, and tobacco. Vegetables are abundant, and excellent fruits are produced in the gardens and orchards in the neighborhood of the towns. Fine camels are bred in large numbers.

The inhabitants are divided into two great branches, the Baluchis and the Brahuis, different in their languages, figures, and manners, and each subdivided into a number of minor tribes. The Brahuis have greater physical strength than the Baluchis, and are less addicted to predatory violence. Both races are hospitable, brave, and capable of enduring much fatigue. Many of them live in rude tents made of black felt or coarse cloth of goat's or camel's hair stretched over a frame of wickerwork. Both Baluchis and Brahuis are very ignorant but zealous Mohammedans. The Baluchi language resembles the modern Persian, the Brahui presents many points of agreement with the Hindu. The manufactures are mostly confined to coarse fabrics and a few matchlocks and other weapons, and the trade is unimportant. The khan, so far as his rule extends, has unlimited power over life, person, and property. He usually resides at Kelat, and his rule is almost confined to the country around it. Quetta is the largest town. It is occupied by a British garrison and strongly fortified.

About the middle of the 18th century Baluchistan was made tributary by Nadir Shah, who bestowed it, with the title of *beglerbeg,* or commander-in-chief, on Nasir Khan, who proved himself the ablest ruler that ever governed the country. On his death in 1795 he left the country in a comparatively prosperous condition, but it has since suffered greatly from intestine wars, and its boundaries have been curtailed. During the Afghan war in 1839 a British force was detached to assault Kelat, which was taken by storm after a siege of a few hours, 13 November the same year. The British again occupied it in 1840, but in the following year they left the country. Latterly a British protectorate over the whole of Baluchistan has been established, and the town of Quetta (which is now reached by railway from India) and a part of the country have been absolutely annexed. The khan receives an annual subsidy from India. The population is estimated at about 800,000.

Balucki, ba-loots'ke, **Michael.** Polish author, known under the pseudonym ELIPIDON: b. Cracow, 29 Sept. 1837. He is most popular as a story-teller of satirical tendency, ridiculing the shortcomings and prejudices of Polish society. Of his novels may be mentioned 'The Awakened' (1864;) 'The Old and the Young'

(1866); 'Life Among Ruins' (1870); 'The Jewess' (1871); 'For Sins Not Committed' (1879); '250,000' (1883). The best among his comedies are: 'The Chase After a Man' (1869); 'The Emancipated' (1873); 'Amateur Theatre' (1879); 'The Open House' (1883). He also wrote lyric poetry and essays on Polish literature.

Bal'uster, or **Ballister,** a kind of short column, sometimes in the form of an ancient bow, sometimes made after the model of Greek and Roman columns, employed in the construction of balustrades.

Balustrade, a series of balusters surmounted by a rail, and placed as an ornament on large buildings, above the cornice, or as a protection to enclose bridges, stairs, balconies, altars, and the like.

Baluze, bä-lüz, **Etienne,** French scholar and historian: b. Tulle, 24 Dec. 1630; d. Paris, 28 July 1718. He early acquired distinction by his varied and thorough knowledge, and was called to Paris by the celebrated Colbert, who commissioned him to make up his private library. In 1707 he was appointed to the supervisorship of the royal college, and dismissed from that office in 1709, being suspected of having in his 'Histoire Généalogique de la Maison d' Auvergne,' designedly established, by documentary evidence, that the princes of Bouillon were descended from the ancient dukes of Guienne, counts of Auvergne, and therefore owed no allegiance to the king of France. Such an offense could not be forgiven; and Baluze, deprived of nearly all his income, was compelled to reside successively at Rouen, Blois, Tours, and Orléans, and not until after the conclusion of the Peace of Utrecht was he permitted to return to Paris. He was of the most amiable temper, and his wit was equal to his cheerfulness.

Balvany, the Magyar name for idol, found in mediæval Latin documents of Hungary, and also in Hungarian geography, applied to various heights which were the last strongholds of paganism in the 11th century.

Balvas, Antonio, Spanish poet: b. Segovia in the middle of the 16th c.; died 1629. He wrote 'Elpoeta Castellano' (1627), a work highly praised by Lopez de Vega.

Baly, William, English physician: b. King's Lynn, 1814; killed in a railway accident near Wimbledon, 28 Jan. 1861. He studied at University College and Saint Bartholomew's Hospital, London, in Paris, Berlin, and at Heidelberg, where he received his M.D. degree in 1836. He commenced practice in London, and in 1841 was appointed physician to Millbank penitentiary, where he attained a reputation as an expert in the hygiene of prisons, on dysentery and cholera. He was appointed lecturer at Saint Bartholomew's Hospital; became a fellow of the Royal Society in 1847; in 1859, was chosen as one of the physicians to the royal family, and later, became censor to the College of Physicians; and crown representative in the Medical Council. He wrote: 'Diseases of Prisons'; 'Gulstonian Lectures on Dysentery' (1847); translated from the German Müller's 'Elements of Physiology,' and 'Recent Advances in the Physiology of Motion, the Senses, Generation and Development'; and with Gull, wrote 'Epidemic Cholera' (1854).

Balzac, Honore de, French novelist: **b.** Tours, 16 May 1799; d. Paris, 17 Aug. 1850. His family was of no account, and the aristocratic "de" (adopted perhaps in good faith), dates from 1830 or thereabouts. The surname itself seems to have been properly spelled Balsa, or Balsas, the first to alter it being the novelist's father, whose parents were peasants in Languedoc. Little is known of the elder Balzac's career, except that he was at one time a lawyer and later an officer in the commissariat; he married past middle age, and at the time of Honoré's birth filled certain municipal offices in the city of Tours. He is represented as a man of whimsical character, caustic but indulgent, with a wonderful memory, and full of schemes for making millions and reaching the age of 100. His wife, whose name was Sallambier, had good looks and a fortune; she is said to have been pious and imaginative, and devoted to her children's welfare, but by no means outwardly tender to them. At any rate Honoré and his favorite sister Laure (afterward Mme. Surville), if not her two younger children also, were brought up very strictly.

He was sent to school early with the Oratorians of Vendôme and was as miserable there as his Louis Lambert. All he learned was by desultory reading, and that in books too deep for his age. His masters thought him dull and lazy, and his absent-mindedness having developed into a sort of daze, he was withdrawn by his parents and became a day-scholar for a time at the Collège de Tours. Neither there nor at a boarding-school in Paris, to which city the family removed in 1814, was he by any means a brilliant pupil; and at home not only his talents but the ambition to write which had already seized upon him remained quite unsuspected. In 1816 he was put into a lawyer's office and 18 months later began to work with a notary, both his chiefs being intimate friends of the family; at the same time he attended various lectures at the Sorbonne, and was becoming familiar with the great writers of his country. His mind was made up to devote himself to literature, when in 1819, M. de Balzac, who had recently lost money in speculation and was about to retire, announced to Honoré that his friend the notary offered to take him into partnership with the prospect of succeeding to his practice. Honoré resisted, and begged for a chance to show his literary gift; after some discussion his father gave him his way and, while the family made its own home at Villeparisis, he was installed in an attic near the Arsenal Library on a two years' trial of his powers, with an allowance barely sufficient to keep him from starving. Here in cold and hunger and solitude, but supported by his unconquerable gaiety and self-confidence, he set to work first on two tales which were soon to be finished, then a comedy, lastly a tragedy in verse, 'Cromwell,' which he firmly believed to be a masterpiece. He brought it home with him in the spring of 1820: the family yawned when he read it, and a friend to whose judgment this first composition was submitted, Andrieux the academician and professor, recommended the young man to try his hand at anything in the world but literature. He had only spent 15 months of his probation, but his mother insisted

that he should now live at home; privations had already told upon his vigor, and he was obliged to recruit in Touraine before settling down at Villeparisis. There, nothing discouraged, in the next five years he wrote, with different collaborators, no less than 31 volumes of fiction, and found publishers for them. Of the entire worthlessness of this early work he was perfectly aware; it appeared under various pseudonyms ('Horace de Saint-Aubin' was the favorite), and when long afterward in great distress for money he allowed it to be republished, he would never acknowledge the paternity.

It was at this time that he became acquainted with the Berny family, then resident at Villeparisis, and formed with Madame de Berny — a woman more than 20 years older than himself — a close friendship which lasted until her death in 1836, and to which he owed, perhaps the most generous and disinterested sympathy that he ever received from man or woman.

In 1824, determined to win his independence, young Balzac returned to Paris and set up business as a publisher on borrowed capital. He had a great scheme — the first of many — for making a fortune by bringing out one-volume editions of the French classics, and began with Molière and La Fontaine; but chiefly for want of proper advertising the venture failed. He next became a printer, having induced his father to advance him the sum necessary to buy the stock and a printer's license, and seeing a type-foundry offered at a bargain he presently acquired that also. It was a most disastrous speculation; bankruptcy was only averted by the help of his mother and of Mme. de Berny, and this was the beginning of his life-long indebtedness.

Before his business was wound up Balzac was already at work, in a room in the Rue de Tournon, upon the first novel to which he signed his name. 'Les Chouans' was finished during a visit to Fourgères, in the district which is the scene of the historical events it describes, and published in 1829 with some success. The rather cynical manual called 'La Physiologie du Mariage' followed; then a number of shorter stories, and, in 1831, 'La Peau de Chagrin'—with which book his reputation became fairly established. Publishers and editors now sought for his work, and the curiosity and interest his writings already excited are attested by the anonymous correspondence which began at this time to pour in upon him. It was in this way that in 1830, he made the acquaintance of two women, the Marchioness de Castries and Mme. Hanska, whose names cannot be omitted from any account of his life. For Mme. de Castries Balzac conceived a transient, but certainly strong passion, which seems to have only gratified the vanity of a rather heartless but very intelligent great lady; she made a plaything of him; but he owed to her his most genuine insight into the manners, traditions, and ideals of the close society of the Faubourg Saint-Germain. Her portrait, it is conjectured, may be found in 'La Duchesse de Langeais.' Mme. Hanska, a Polish lady of birth, married to a Russian in the Ukraine, was the object of his deepest and most enduring affection, and eventually became his wife. His letters to this «Etrangère» have in recent years been published; they are discreet, frequent, and voluminous, for these friends or lovers were seldom together, even after the death of M. Hanska, until the last two years of Balzac's life. His biographers have little tenderness for Mme. Hanska; hers was certainly an inexpansive nature; her love for her only child, the Countess Anna (afterward Mme. Mniszech), seems to have almost excluded other affections; she cared excessively for her rank and her comfort; tortured the great man by long deferring to fulfil her secret engagement with him, and in his last illness appears to have shown herself incredibly callous. Mme. Honoré de Balzac lived until 1882.

Balzac's story, from 1830 onward, is mainly the story of his herculean industry; and the most memorable dates in his life are doubtless those of the production of such masterpieces as 'Louis Lambert' (1832), 'Le Médecin de Campagne' and 'Eugénie Grandet' (1833), 'La Recherche de l'Absolu,' and 'Le Père Goriot' (1834), 'César Birotteau' (1837), 'Illusions Perdues' (1835–1841), 'Les Paysans' (1844–1845), 'La Cousine Bette (1846), 'Le Cousin Pons' (1847). Between 1830 and 1842 he wrote no less than 79 novels, besides much other literary work. After that date his literary activity slackened somewhat as his health began to fail. But during a considerable number of years, for long intervals together, he never worked less than 12 hours each day, often worked for 15 hours, or even for 20 at a stretch, supporting himself on a lean diet in which fruit was always an important element, and drinking as much coffee as the philosopher Kant. But he was never out of harness, even during his frequent absences from Paris — whether staying with friends in the French provinces, or art collecting in the north of Italy, or mine-prospecting in Sardinia (one of his most extraordinary ventures), or visiting Mme. Hanska at Geneva, Vienna, Berlin, or Saint Petersburg. These travels, a short-lived journalistic enterprise—'La Chronique de Paris'— several excursions into drama, more than one attempt to force the doors of the French Academy, and many quarrels with the press — a lawsuit with the 'Revue de Paris' made some stir in 1836 — are the chief outward events of Balzac's maturity. Throughout his career the money question is distressingly prominent, and the history of Balzac's liabilities is long and queer and complicated. The sums he made by his pen were very considerable; but his optimism was at least as great as his acquisitive faculty. No man was more capable of penurious living; none loved luxury better; but decent comfort and regularity were beneath or beyond him. Spells of asceticism were succeeded by fits of extravagance; the story of his suburban property Les Jardies, of his famous walking-stick, of the financier Goujon's house in the Rue Fortunée (now the Rue Balzac), which he bought for his future wife and spent half a million in filling with works of art — the very works described in 'Le Cousin Pons'— balances the story of his sacrifices, privations, and his games of hide-and-seek with creditors. He was a born speculator; he was also the most generous of men, and sometimes unfortunate in the objects of his generosity.

The strain entailed by Balzac's way of living and by his constant mental agitation was such as no constitution — and his was extraordinarily robust — could resist very long. From 1842, or

HONORÉ DE BALZAC.

thereabouts, he began to suffer from time to time with heart and lung troubles, and from 1845 onward he was rarely well. It was during his second stay at Vierzschovnian, Mme. Hanska's property in the Ukraine, that his health began to give serious anxiety. For a time he improved; but the climate, the uncertainty in which he was kept as to the reward of his long devotion, certain material obstacles to his marriage, the necessity of conducting his literary and other transactions by proxy, the anxieties of the political situation in France, misunderstandings with members of his own family, and the effort to force himself to work when work was beyond his failing physical powers, all hastened his end His marriage was solemnized at last in March 1850, at Berditchef, in Poland; rather more than two months later, Balzac arrived in Paris with his bride. He was a dying man, though he clung almost to the last to the hope of living to finish 'The Human Comedy,' and extinguish what was left of his debts. Victor Hugo was among those who visited his deathbed, and the same great poet it was who paid a splendid tribute to his friend and peer at the graveside in Père Lachaise. Occurring in the midst of a grave political crisis, his death was less noticed than might have been expected; but though widely read and fervently admired among his contemporaries — more especially perhaps in foreign countries — it wanted at least another generation to assure his fame; nor (thanks to a combative spirit and an ingenuous vanity) did he lack enemies; though the mere dedications of his novels are enough to show that his friends were among the elect of his age, and it is impossible to read his correspondence without a feeling of respect, and even of affection, for a personality so rich, so valiant, so tenacious, and so kindly.

It is best, in so slight an estimate of Balzac's colossal achievement as can be attempted here, to leave out of account not only the worthless fiction of his nonage but also his plays, of which only one, 'Mercadet,' first called 'Le Faiseur,' and produced with considerable changes after its author's death, can be said to have won or deserved success. An exceptional place belongs to the 'Merry Tales,' not so much in virtue of their notorious, guileless, and jovial salacity as because, while the form is more essential there than in anything else he wrote, they are among the very few skilful *pastiches* in literature — for the lapses they contain from either the language or the atmosphere of the early French Renaissance are astonishingly few — in which the mere erudition does not replace or overshadow other merits. They are memorable for their genuine zest, inventive vigor, and shrewd humanity.

Balzac's glory, of course, is that unfinished series of masterpieces called 'The Human Comedy,' which it is necessary to consider as one work in order to appreciate the audacity and breadth and steadiness of aim which are essential titles to his rank, not merely as the father of the modern novel and the supreme master of the craft, but as a genius of the universal order. In its most obvious bearing, it is an imaginative reconstruction of French society in every part and aspect, with all the vicissitudes and variations that affected it between the Revolution and the middle of Louis Philippe's reign: an heroical design, less comprehensive in regard to time and space than that of the Waverley novels, but more consistently and coherently executed out of more copious material. The picturesque, however, was subordinate to the philosophical interest, as he conceived it, of Balzac's undertaking. He intended his work for nothing less than a natural history of civilized man, which should illustrate the war between the passions of the individual and the social instinct or the common interest, the differentiation of types by the action of gregarious life, the reflection of personality in matter, and the stamp of habits and calling upon character. The theory outlined by Buffon and bequeathed by Geoffroy Saint Hilaie to the first evolutionists, which supposes a single original pattern of organic creation varied by the mere effects of environment, fascinated Balzac by a partly chimerical but, at any rate, suggestive analogy with human existence. «Does not society,» he asked in his general preface of 1842, «make of man, according to the sphere in which his activity develops, as many different men as there are species in zoology?» This conception is enough to explain one great characteristic of his novels — the importance attributed in them to atmosphere, to local influences, to material conditions, to all that the elder novelists had regarded as accidental and accessory. It is Balzac who set the example of bestowing as much care upon *things* as upon *men* in works of fiction. The description of streets, houses, furniture and works of art, of implements and equipages, of dress and pastimes, of customs and offices, business and procedure and, in particular, of all that pertains to money, is, throughout 'The Human Comedy,' not only exact and elaborate (sometimes to the point of tediousness and disproportion), but above all significant. Séchard's printing-press and Gaudissart's advertisements, the laboratory of Balthazar Claës, the aroma of Maman Vauquer's dining-room, are part and parcel of those famous personages.

The French imagination had tended for some time to desert that psychology *in abstracto* which had been at once the glory and the limitation of the great classical authors, and to pay more attention to the setting and the background of fictitious characters. Diderot particularly, who on several grounds might be called a herald of Balzac (and resembled him in vitality, variety of knowledge, fertility, hasty and unequal execution), had done much to carry into pure literature a spirit of curiosity about the common things of life, a new multiplicity of interests and concern for reality, and some of the results of natural science. But the romantic contemporaries of Balzac, most of whom were irresistibly allured by the prestige of the old and the distant, used the extension of imaginative matter to enhance the picturesque value of descriptions, rather than to enrich the definition of human types; for their interest in characters is generally insufficient, being dependent upon an introspection distorted as often as not by a morbid vanity. Balzac is unique in this, that with a searching modernity of outlook which omits none of the sensible elements of life from his imaginary world, he is yet essentially the restorer of the old, patient, constructive psychology and of the drama of internal action. It is remarkable how much of the spirit of the

grand siècle survives in his work; how much of La Bruyère in the brilliant pages of moral analysis, of Corneille in some of his heroes of the will of Molière in the smiling sanity of his attitude toward a necessarily imperfect society, of Racine in the sympathetic presentment of absolute passions and their victims! Balzac's personages — even the secondary figures — are at once individuals and types. They live with the intense life of living men and women; and we accept them as great moral symbols. They are highly differentiated, particularized with an unsurpassable sureness of detail; but they are also, one and all, informed by an *idea* — so that, though there is only one Goriot, he sums up all the tragedy of a primal affection run to seed and despitefully entreated; and there is only one Baron Hulot, but he contains all the shame of elderly profligacy, bringing disaster on whole families; and César Birotteau is inimitable, but he stands for all that is sterling as well as all that is ridiculous in the middle class.

In the vitality of his creatures Balzac is not inferior to Shakespeare himself. But we believe not only in the people he made, but in the whole world of 'The Human Comedy,' and accept it as a rival of reality. This mastery of illusion, the very highest virtue in a writer of fiction, does not depend upon veracity or exactitude of detail (a test which upon the whole he sustains triumphantly), but is simply the power to imagine strongly. It is true that in this case a system of composition which discarded chapters, or rather made of each novel (by the continual reappearance of old friends among the characters) a chapter in the whole work, is a powerful help to illusion; so of course are the accumulation of circumstances, and especially perhaps the variety and distribution of interests, in which Balzac's astonishing invention seems to play the part of chance.

The work of Balzac displays at one view the whole capacity of the form of literature called fiction, its scope and possibility of content. The ordinary tone of the French novel had once been heroic and pastoral; then it had tended to caricature and to the parodying of court memoirs; and later the ideal had been to amuse one class by showing the manners of another. The picturesque romance had been succeeded by «realistic» satires upon society and, with the advent of the *philosophes,* the novel became a pamphlet, a vehicle of moral or political doctrines. Perhaps all these phases are represented in 'La Comédie Humaine': the novel according to Balzac is simply a universal instrument like Homer's epic or Shakespeare's drama. The ineffaceable mark of his achievement upon his successors is that, since Balzac, the novel in France is not a toy but a serious art. Balzac indeed would not have been content with the qualification; half the preface already referred to is an apology for the novel considered as a work of science and a means of propaganda, and to him — to his precept rather than to his practice — must be traced the arrogant pretensions of some modern writers of fiction, their sermons and sociology and what Flaubert so disdainfully called their *manie de conclure.* A work of imagination does not need the protection of a political creed or a scientific hypothesis; it is Balzac's weakest side that, while he sinks what we call his personality almost always, he frequently obtrudes fallible opinions — matter for argument — into the domain of the imagination. His royalism is an interesting fact, but in his novels it is irrelevant; the same is true of many of his political prophecies. It should be added that he seldom intervenes directly in the discussion of scientific theories (which hold a somewhat important place in his novels), though with characteristic credulity he identifies himself expressly with the speculations of the phrenologists! There was a mystic in Balzac, and that section of his work, 'Philosophical Studies,' which deals with the solitary adventures of the mind in regions beyond the world of sense, is strangely original and fascinating.

He was, in some degree reluctantly, an artist — a prodigious though an imperfect artist. His defects of form have been exaggerated. His style, like Saint-Simon's, is vigorous and vivid in default of correctness, and full of fortunate phrases; but he was wanting in the sense of idiom, and the effort to condense his thought often produced a clumsy syntax and obscurity. Haste no doubt accounts for some base coinage, repetition, and inadequate expressions. As of other writers of his stature it may be said of him that his fecundity was necessarily wasteful, so that a part of his work is greater than the whole. This exuberance, a certain worship of the excessive, a stupendous confidence for which no design is too large, and a preference for the expressive over the symmetrical, for colour over draughtsmanship, are characteristics which he shares with several great Frenchmen of his generation — the generation conceived in camps and lulled by the guns of Austerlitz, which grew up haunted by a vision of heroical accomplishment. Honoré de Balzac stands beside Victor Hugo and Jules Michelet and Hector Berlioz and Eugène Delacroix — a giant among giants, a perennial force among the intellectual forces of the world.

Bibliography.—The best edition of the complete works of H. de Balzac is the 'Edition Définitivé' in 24 volumes (Paris, 1869–76). Uniform with it are the letters to Mme. Hanska, 'Lettres à l'Etrangère,' posthumously published in 1899. There exist numerous English translations of insulated novels. Prof. G. Saintsbury in the general edition of a complete English translation of a 'Human Comedy,' by various hands, in 40 volumes (London, 1895–98). The letters to Mme. Hanska have been translated by D. F. Hannigan—'Love Letters of Balzac' (London, 1901). Among biographical and critical studies of Balzac the more valuable are the following: L. Gozlau, 'Balzac chez lui' (1862); E. Biré, 'Balzac' (1897); Le Breton, 'Balzac, l'homme et l'œuvre' (1905); F. Brunetierè, 'H. de Balzac'; Vicomte Spoelberch de Lovenjoul, 'Histoire des œuvres de Balzac' (1880); 'La Genèse d'un roman de Balzac'—'Les Paysans' (1901); 'Un pays perdu d'H. de Balzac' (1903). The short life of her brother by Mme. Surville (Laure de Balzac), first published in 1858, is included in the volume of the 'Edition définitive' containing Balzac's general correspondence. In English Mr. Frederick Wadmore has written a 'Life of Balzac'; and a better-informed study by Miss M. F. Sandars appeared in 1904.

F. Y. Eccles.

Balzac, Jean Louis Guez de, French essayist and letter writer: b. Angoulême, 1597; d. 18 Feb. 1654. In his youth he was secretary to Cardinal La Valette at Rome. He returned to Paris, devoted himself to literature, and under Richelieu became councilor, and historiographer of France, and was one of the most influential members of the Academy from its foundation, likewise a sort of oracle of the Hôtel Rambouillet. His influence on French prose is ranked with that of Malherbe on poetry. Besides his 'Letters' (1624), which are elaborate epistles with a definite attempt at style, he wrote 'The Prince' (1631), a glorification of absolute monarchy; 'The Dotard' (1648); 'The Christian Socrates' (1652); and 'Aristippus' (1658), the latter intended to portray the ideal statesman. His 'Letters' were edited by Larroque (1874).

Balzico, bäl-tsē'kō, **Alfonso,** Italian sculptor: b. 1825. He was educated at the Academy of Naples, and in Rome. Among his works are: 'John the Baptist'; 'Cleopatra'; 'The Free'; 'Vincenzo Bellini'; 'Duke Ferdinand of Genoa'; and 'Victor Emmanuel.'

Bambarra, bäm-bär'ra, a negro kingdom of western Africa, lying at the point where 5° W. lon. and 12° N. lat. cross. It was first visited by Mungo Park. In the east the country is flat and swampy; but in the west there are low chains of granite hills. The climate in some parts is intensely hot, but is generally healthy. The land is well watered and fertile. The rainy season is from June to November. Cotton, maize, and yams are raised. The inhabitants, a branch of the Mandigoes, number about 2,000,000 and are superior to their neighbors in intelligence. The principal towns are Sego, Sansandin, Yamina, and Bammako. Many local merchants are very wealthy, and a quite extensive trade is carried on, the natives working articles in gold, ivory, and iron. In 1881 a treaty with the sultan of Sego opened up the country to French traders.

Bamberg, bäm'bĕrg, a town of Bavaria, in Upper Franconia, on the navigable Regnitz (which here divides into two), three miles above its junction with the Main, partly on a plain, partly on hills, amid vineyards and gardens. Its chief edifice is the Roman Catholic Cathedral, built in the 12th century, and forming one of the finest examples of the transition from the Romanesque to the Gothic style, with four towers, a noteworthy portal, and interesting sculptures and monuments. Other buildings include the old palace or residence; another palace, formerly occupied by King Otto of Greece; the former castle of the prince-bishops of Bamberg, etc. The educational institutions include a college or lyceum, an old and a new gymnasium, a Roman Catholic seminary, an observatory, etc. There is a library containing 300,000 volumes, with valuable MMS. and early printed books. There are manufactures of cotton and woolens, besides other industries, such as market-gardening and seed-growing, brewing, etc. The United States is represented by a resident consul. Pop. (1902) 42,300.

Bamberger, Heinrich von, Austrian pathologist: b. Prague, 1822; d. 1888. He was graduated in medicine in 1847, and became professor of special pathology and therapeutics, first in the University of Würzburg, and in 1872 in the University of Vienna. Of his numerous publications, two have been held in particularly high esteem, 'On the Diseases of the Chylopoietic System' (1855), and 'Treatise on Diseases of the Heart' (1857).

Bamberger, Ludwig, German statesman: b. Mainz, 1823; d. 1899. He was educated at Giessen, Heidelberg, and Göttingen; took part in the revolution of 1849; and was a member of the German Reichstag 1873–80. He was an advocate of free trade, and on account of his opposition to Bismarck's economic policy, he left the National Liberal party and joined the "Secessionists," a group which later became part of the German Liberal party. His publications include 'Monsieur de Bismarck' (of which there is an English translation; 'The Five Milliards'; 'Germany and Socialism'; etc.

Bambino, bäm-bē'nō, the figure of our Saviour represented as an infant in swaddling clothes. The 'Santissimo Bambino' in the Church of Ara Cœli at Rome, a richly decorated figure carved in wood, is specially venerated, and is often the object of impressive religious demonstrations.

Bambocciades, bäm-bŏch-ĭ-ädz', paintings generally grotesque, of common, rustic, or low life. The name is derived from the nickname of Peter Van Laer, a Dutch painter of the 17th century, who, on account of his deformity, was called *bamboccio* (cripple). Teniers is the great master of this style.

Bamboo, the common name of more than 200 species of about 20 genera of perennial, mostly tree-like, tropical and sub-tropical grasses unevenly distributed throughout the world, but most abundant in southern Asia, where 160 or more species are found from sea-level to altitudes of 10,000 feet or slightly more in the Himalayas; and next most plentiful in America, where there are about 70 species, some of which reach elevations of 15,000 feet in the Andes. Occasional specimens of the larger species attain a height of 120 feet and a girth of 3 feet. From the jointed root-stock the numerous jointed, usually straight and erect, but sometimes crooked or creeping stems grow without branches until the full height is reached, when a more or less dense thicket of horizontal limbs is developed, and the great panicles of flowers appear.

The number of uses to which these plants are put rivals that of the palms. In fact the various species can be utilized for man's every purpose. The light, elastic hard stems, hollow or slightly pithy, except at the joints, which are strong partitions, are used for bridges, masts, poles, joists, fishing-rods, etc.; when the partitions are removed, for waterpipes; when sawed in sections, for pails (the natural partitions serving as bottoms), cooking-utensils, life-preservers, bows, arrows, quivers, walking-canes, flutes, and smoking-pipes; when split, for nets, hats, fishing-rods, wicker-work, and umbrellas. Parts of the leaves of some species are used for paper-making, thatch, and hats; the young shoots of some are used as food, either boiled or pickled; the seeds, for food and for making a kind of beer; some of the spiny species are planted as hedges for defense against foes, animal and human.

Some species yield "Indian honey" (so called by the Greeks), the air-dried saccharine exudations from the nodes. Sometimes this sub-

stance is called *tabaris* or *tabasheer* (q.v.), which is properly a phosphorescent substance obtained from other species and from related grasses. Many of the species are of exceedingly rapid growth; even in greenhouses specimens have been known to attain a height of 20 feet in two months or even less time. In arid climates the bamboos are often of great value, since they are among the few plants that will grow in such places. Many species are cultivated for ornament, not only in warm countries, but in greenhouses. Some species are hardy in climates where the thermometer does not fall much below the freezing-point. In general the hardy species do best in deep, rich soil, and warm situations protected from severe winter winds. The roots should be given a protective mulch of litter in autumn, and this should be allowed to remain during the summer as a moisture conserver. For an account of ornamental bamboo culture in greenhouse and out of doors, and of the ornamental species grown in America, consult Bailey & Miller, 'Cyclopedia of American Horticulture.'

Bamboo Rat, a name given to several species of mole-rats, of the genus *Rhizomys,* found in the bamboo jungles of India.

Bamborough (băm'bŭr-ō) **Castle,** an ancient English castle on the coast of Northumberland, formerly with its connected estate the property of the Forsters, and forfeited to the Crown in 1715, both being purchased by Lord Crewe, Bishop of Durham, and bequeathed by him for charitable purposes.

Bam'bouk, or **Bambuk,** a region in west Africa, in the French colony of Senegal, between the Falémé and Senegal rivers, between lat. 12° 30′ and 14° 30′ N.; lon. 10° 30′ to 12° 15′ W., and estimated to be about 140 miles in length by 80 to 100 in breadth. Besides the Senegal, its tributaries, the Falémé and the Bafing (or Upper Senegal), form its natural boundaries. A considerable part is somewhat rugged, though not very elevated, the highest points seldom exceeding 600 feet. The valleys and plains are remarkably fertile. The baobab, calabash, tamarind, with a variety of acacias and palms, reach the utmost limit of their fruitfulness; maize, millet, cotton, and a multitude of leguminous plants grow almost without culture, and rice is produced in the lowlands, which are subject to inundation. Its unhealthiness, however, makes it almost uninhabitable by Europeans. The animals comprise lions and elephants, wild cattle, crocodiles, etc. Gold is found in abundance. It is carelessly worked, and is given to traders in exchange for salt, an article in great demand, and various other goods. Bambouk is more sparsely inhabited than formerly. The natives are Mandingoes and form a considerable number of communities or confederations more or less hostile to each other. The country has latterly been fully explored by the French, who are developing its resources and have constructed a railway along the Senegal from Kayes to Bafulabé. In the 15th century the Portuguese, allured by the fame of its gold, invaded Bambouk, but ultimately perished almost to a man, partly through intestine dissensions and debauchery, and partly by the weapons of the natives.

Bamian, bä-me-än′, a valley and pass of Afghanistan, the latter at an elevation of 8,496 feet, the only known pass over the Hindu Kush for artillery and heavy transport. The valley is one of the chief centres of Buddhist worship and contains two remarkable colossal statues and other ancient monuments.

Bammako, bä-mä'kō. See BAMBARRA.

Bampton Lectures, a course of lectures established by John Bampton, canon of Salisbury, who bequeathed certain property to the University of Oxford for the endowment of eight annual divinity lectures to be annually delivered. The subjects prescribed are, the Confirmation of the Christian faith and the confutation of all heretics and schismatics; The divine authority of the Scriptures; The authority of the primitive Fathers in matters of Christian faith and practice; The divinity of Christ; The divinity of the Holy Ghost; The Apostles' and Nicene creeds. The lecturer must have taken the degree of M.A. at Oxford or Cambridge, and the same person may not lecture twice. The first course of lectures was delivered in 1780, and they have been delivered every year since, with the exceptions of 1834, 1835, and 1841. A list of the lectures will be found in the yearly 'Historical Register of the University of Oxford.'

Ban, the title of the governors of certain military districts in the eastern part of Hungary, corresponding to the German title of margrave. The ban is nominated by the king, renders an oath to the Diet, and formerly had very extensive powers, exercising an almost absolute authority in the political, judicial, and military affairs of his district. The progress of Turkish conquest after the unfortunate battle of Mohacs in the 16th century extinguished the most of the banats, and there remains now only the banat of Temesvar, the ban of which is the third great dignitary of the Hungarian kingdom and has the title of ban of Croatia.

In Teutonic history the ban was an edict of interdiction or proscription: thus, to put a prince under the ban of the empire was to divest him of his dignities and to interdict all intercourse and all offices of humanity with the offender. Sometimes whole cities have been put under the ban; that is, deprived of their rights and privileges.

Bana, bä'na, in Hindu mythology, a thousand-armed demon or giant who was the enemy of Vishnu, but the friend of Siva.

Ban'ak, or **Ban'nock,** an Indian tribe of Idaho. Its territory formerly extended over southern Idaho and eastern Oregon; but the tribe is now concentrated on the Fort Hall and Lemhi reservations, Idaho. Those of the latter reservation are confederated with the Shoshoni.

Banana, ba-nä'na, an island in west Africa, north of the mouth of the Kongo; also a seaport of the Kongo Free State, situated on the island. A few years ago the town was an important commercial station, but after the building of the railroad from Matadi, and the establishment of an ocean steamship line direct to that place, Banana began to decline, and, at last lost all its trading importance when the extensive Dutch firms formerly established there removed their headquarters to Kabinda and Kisanga, in Portuguese territory.

Banana (*Musa sapientium*), a tropical herb of the natural order *Scitaminaceæ,* apparently native of India, but unknown in a wild state;

BAMBOO GROVE IN JAVA.

valued somewhat for its fibre and decorative appearance, but mostly on account of its fruit, for which it is widely cultivated in warm climates. For a large part of the human race it ranks as high as cereal grains among northern peoples. Though considered less nutritious than an equal weight of potatoes, the banana is said to produce more food upon a given area and to be capable of sustaining a larger number of persons than wheat. From its perennial rootstocks suckers are thrown up to a height of from 8 to 40 feet or more. They bear a whorl of paddle-like leaves, from among the bases of which, in about two years, a large heart-shaped scaly bud appears. As the bud grows it becomes pendant, the scales separate and disclose groups of upward-pointing flowers sometimes to the number of 150. The fruit is gathered while still green, the stem being cut at the same time. Of the suckers that quickly appear, one, two, or three are allowed to remain for the succeeding crop. When once established the plants should bear a bunch every year. Since the plants rarely or never bear seeds, suckers are usually relied upon for propagation. Propagation by means of root-cuttings is a more rapid means of multiplying the number of plants, but is used only when large numbers are desired. The plants are set in the field 8 to 12 feet apart when two or three feet high; when full grown they completely shade the ground. Since 1870, when only a few hundred bunches were imported into the United States, the banana has become increasingly popular: in 1899 $5,600,000 worth was imported, mainly from the West Indies and Central America. California, Florida, and Louisiana produce a small quantity, but these States cannot be expected to compete with warmer climates. Banana flour, produced in the tropics from ripe bananas, is growing in popularity wherever introduced, and dried bananas seem to promise an outlet for excessively heavy crops. The botanical name, *Musa sapientium*, which means "of the wise muse," alludes to Theophrastus' statement that the wise men of India used a certain fruit for food, which seems to have been the banana or the plantain.

Banana-birds, any of several small West Indian insect, and honey-eating birds that frequent the banana groves, especially the banana-quit (*Certhiola flaveola*) of Jamaica, whose pretty ways are described at length by Gosse in his books on the natural history of that island. One species (*C. bahamensis*) occasionally visits Florida. All these birds are brilliantly plumaged, usually rich blue with yellow markings, and represent the sun-birds (q.v.) of the Eastern tropics.

Banana-fish. See LADY-FISH.

Bananal, bä-na-näl′, also called SANTA ANNA, an island in Brazil, formed by the River Araguaya, in the province of Goyaz. Its length is 200 miles; breadth 35 miles. It is covered with dense forests, and has in its middle an extensive lake. Soil, fertile. Also the name of several small villages in Brazil.

Banas, ba-näs′, a common name for rivers in India. The most important are: (1) a river of Shutia Nagpur, Bengal, having a northwest course of about 70 miles, and falling into the Sone, near Rampur; (2) a river which rises in the Aravulli Mountains, and, after a southwest course of 180 miles, is lost in the Runn of Cutch; (3) a river of Rajputana, also rising in the Aravulli Mountains, flowing northeast through Mewar for 120 miles, then southeast, and falling into the Chambal, after a total course of 300 miles.

Ban′at, a term applied to any district ruled by a ban (q.v.). Specifically a large and fertile region in Hungary, consisting of the counties of Temesvar, Torontal, and Krisso; principal town, Temesvar. The region originally belonged to Hungary; was occupied by the Turks in 1652–1716; and was reunited to Hungary in 1779. The population exceeds 1,500,000.

Ban′bridge, Ireland, a market town in County Down, 22 miles southwest of Belfast, situated on the Bann. It has an Episcopal church in the Gothic style, and several other churches. The principal manufacture is that of linen, which is carried on to a great extent. Pop. (1901) 5,376.

Ban′bury, England, a municipal borough and market town of Oxfordshire, on the Oxford Canal, 23 miles north of Oxford, and 78 northwest of London by rail. Its strong castle, built about 1125, was demolished during the Great Rebellion, when Banbury was noted for Puritanical zeal. In 1469 the Yorkists were defeated in the vicinity. The town is still famous for its cakes and ale, as in Ben Jonson's day; and it manufactures webbing and agricultural implements. Among the buildings are the parish church (1797) and the town hall (1854). Pop. (1901) 12,967.

Banc (Lat. *Bancus,* Ger. Bank, a bench), legally a seat or bench of justice, and in this sense has given rise to the expression in courts of common law, "sitting in banc," or *in banco* — that is, sitting together on the bench of the respective courts.

Banca, bän′ka, **Banka,** or **Bangka,** an island of the Malay Archipelago, belonging to the Netherlands, between Sumatra and Borneo; area, 5,000 square miles. It possesses several considerable bays and is hilly. It is celebrated for its excellent tin, obtained in black alluvium in the north end of the island, about 25 feet below the surface, and of which the annual yield is about 4,000 tons. Banca likewise yields iron, copper, lead, timber, sago, nutmegs, benzoin, etc. The population is about 100,000, of which a large proportion are Chinese.

Banca, a boat used in the Philippines, made from a single log and furnished with an out-rigger.

Ban′co, a term designating the money in which the banks of some countries keep or kept their accounts in contradistinction to the current money of the place, which might vary in value or consist of light and foreign coins. The term was applied to the Hamburg bank accounts before the adoption (in 1873) of the new German coinage. The mark banco had a value of 35.43 cents; but there was no corresponding coin.

Ban′croft, Aaron, Unitarian clergyman: b. Reading, Mass., 10 Nov. 1755; d. 19 Aug. 1839. He was graduated at Harvard in 1778; became pastor in Worcester in 1785, where he remained nearly 50 years. Besides a great number of sermons, his works include a 'Life of George Washington' (1807). He was the father of the historian, George Bancroft.

Bancroft, Cecil Franklin Patch, educator: b. New Ipswich, N. H., 25 Nov. 1839. He graduated from Dartmouth in 1860; at Andover Theological Seminary in 1867; and at the University of Halle, Germany. He was ordained to the Congregational ministry in 1867, but has never held a pastorate. In 1873 he was made principal of Phillips Academy, Andover, Mass., and since then has sent more boys to colleges and scientific schools than any other American secondary school teacher. He has frequently contributed religious and educational articles to periodicals.

Bancroft, Edward, American physician: b. Westfield, Mass., 9 Jan. 1744; d. 8 Sept. 1820. Early in life he ran away from home; became a practising physician in Guiana; and passed the latter part of his life in England. During the Revolutionary war he is believed to have been a spy for the British. His publications include a 'Natural History of Guiana' (1769) and 'Researches Concerning the Philosophy of Permanent Colors' (2 vols. 1794–1813).

Bancroft, George, American historian: b. Worcester, Mass., 3 Oct. 1800; d. Washington, D. C., 17 Jan. 1891. He was the son of Rev. Aaron Bancroft (q.v.), a Unitarian clergyman, and Lucretia Chandler Bancroft. He fitted for college at Phillips Academy, Exeter, N. H., entered Harvard College at the age of 13, and was graduated before reaching his 17th birthday. Edward Everett, then professor of Greek, having proposed that some young graduate of promise be sent to Germany for purposes of study in order that he might afterward become one of the corps of instructors, Bancroft was chosen, and in the summer of 1818 went to Göttingen, where two years later he received his degree of Ph.D. At Göttingen he studied German literature under Benecke; Italian and French literature under Artaud and Bunsen; Oriental languages and New Testament Greek under Eichhorn; natural history under Blumenbach; and the antiquities and literature of Greece and Rome under Dissen, an enthusiastic admirer of Plato, with whom he went through a thorough course of Greek philosophy. But his chief attention was given to history, which he studied under Heeren, the greatest historical critic of that day, and one of the most scientific of all historians. In choosing this special branch, Bancroft gave as a reason his desire to see if facts would not clear up theories and assist in getting out the true one. For a time he also studied at Berlin, where he was warmly received by the leaders in the academic world, notably, Wolf, the editor of Homer; Schleiermacher, and Hegel, to whom he brought tidings of their fame in the New World. In an extended tour through Germany and other countries he met Goethe at Jena, studied for a time with Schlosser at Heidelberg, formed an acquaintance with Manzoni at Milan and a life friendship with Chevalier Bunsen at Rome, where he also met Niebuhr. At Paris he was kindly received by Cousin, Benjamin Constant, and Alexander von Humboldt. Returning to America in 1822 he served for a year as tutor in Greek at Harvard. In 1823, in conjunction with J. G. Cogswell, he established the famous Round Hill School at Northampton, Mass., a preparatory school far in advance of its time as to systems of study and class-books. The teachers were good, the instruction inspiring, and the students led a happy, healthy life, but the undertaking proved a failure financially. Bancroft withdrew in 1830, and Cogswell two years later. Many of their students afterward became men of national reputation or prominence, among them being J. L. Motley, Ellery Channing, G. E. Ellis, and Theodore Sedgwick. Henceforward his career is best separated into political and literary. During the Round Hill years he had cut loose from the political traditions of the Harvard circle. In a public speech in 1826 he had avowed his principles to be for universal suffrage and uncompromising democracy, and at once became foremost in the councils of the Democratic party, though twice declining nomination or election to the State legislature. Van Buren appointed him collector of the port of Boston (1838–41), and his administration of the office won the praise of his political opponents. While collector he appointed Nathaniel Hawthorne and Orestes Brownson to offices within his jurisdiction. In 1844 he was defeated as the Democratic candidate for governor of Massachusetts, although he received more votes than any previous candidate of his party. In 1845 he became secretary of the navy under Polk. It was he who planned and established the Naval Academy at Annapolis, Md.; he gave the first order to take possession of California; and while acting secretary of war ordered Gen. Taylor to march into Texas, thus ultimately leading to the annexation of that State. During 1846–9 he was minister-plenipotentiary to Great Britain, and there successfully urged upon the British ministry the necessity of adopting more liberal navigation laws. His reputation as a man of letters put the manuscript treasures of the great English families at his disposal, and he combined his public duties with ardent historical researches. From 1849 to 1867 he lived in New York city, absorbed in literary work. During the Civil War he was a patriotic War Democrat, and delivered a powerful speech effectually demolishing the Constitutional plea for slavery. Before both Houses of Congress he delivered a masterly eulogy on Lincoln. Appointed minister to Prussia in 1867 he achieved a diplomatic triumph in bringing about the adoption of treaties in which England and Germany finally recognized the right of expatriation and abandoned their doctrine of «once a citizen, always a citizen.» In the northwest boundary treaty, negotiated by Polk, there was an ambiguity concerning a portion of the line. It was decided to submit the point to the German emperor for arbitration. Bancroft prepared the whole American argument and the reply to the case of the British. The decision was unreservedly in favor of the United States.

His first publication was a volume of 'Poems' (1823), all European in theme. This was followed by books for the use of his students, translations of Heeren's 'Politics of Ancient Greece' (1824), and Jacobs' 'Latin Reader' (1825). His first article in the 'North American Review' appeared in October 1823, and was a notice of Schiller's 'Minor Poems' with numerous translations. Thenceforward he wrote in almost every volume, but always on classical or German themes, until in January 1831, he took up 'The Bank of the United States', and in October 1835 'The Documentary History of the American Revolution.' The two

GEORGE BANCROFT.

latter indicate the direction his historical studies had taken. Then came the beginnings of his great 'History of the United States,' the work which gave him his greatest fame. The first volume appeared in 1834, the second in 1837, the third in 1840, the fourth in 1852, the fifth in 1853 and so onward to the tenth in 1874. The earlier volumes were received with enthusiasm in America, pirated in England, translated into Danish, Italian, German, and French, both with and without the author's permission. The 15th editions of Vols. I–III was issued in 1853. The design of the work was as deliberate as Gibbon's, and almost as vast, and, like Gibbon, Bancroft lived to see his work accomplished. The history of the United States from 1492 to 1789 is treated in three parts. The first deals with 'Colonial History, 1492–1748.' The second part, 'The American Revolution, 1748–82,' is divided into four epochs called respectively: 'Overthrow of the European Colonial System, 1748–63'; 'How Great Britain Estranged America, 1763–74'; 'America Declares Itself Independent, 1774–5'; and 'The Independence of America Acknowledged, 1776–82.' The last part, though published as a separate work, entitled 'History of the Formation of the Constitution, 1782–9,' is really a continuation of the 'History.' The work is still the most popular and widely read of the larger American histories. Bancroft's materials and facilities for writing it were better and more extensive than any other writer on our Anglo-American history has enjoyed. His private collection of manuscripts and documents, original and copies (now in the Lenox Library, New York), was by far the finest of his day in private hands, and superior to most institutional collections. His merits as a historian are positive and incontestable. For his subject he had a boundless and untiring enthusiasm, and he was permeated with that democratic spirit without which the history of the United States cannot be adequately written. Though his early style is justly open to the charge of being pompous, inflated, and over-ornamented, it is essentially picturesque, and the earlier defects were greatly remedied by his successive revisions of the work. His command of his resources was masterly, and a far from favorable critic candidly admits that «one must follow him minutely through the history of the war for independence to appreciate in full the consummate grasp of a mind which can deploy military events in a narrative as a general deploys brigades in a field. Add to this the capacity for occasional maxims in the highest degree profound and lucid, and you certainly combine in one man some of the greatest qualities of the historian.» It has been said that he made no effort to avail himself of the materials and results of other investigators, but nowhere does he claim finality for his work, and his later years were chiefly occupied in weaving into his narrative what he and no one else had. In 1876 he issued a Centenary edition in six volumes, upon which he had spent a solid year in revision. Again in 1883–5 he published what he termed the «author's last revision» in six volumes large octavo. In this he made considerable changes in arrangement and the subdivisions, all tending to a better ordering of the narrative. There were frequent omissions and condensations, and many repetitions and redundancies were cast out. These final changes have, in the judgment of good scholars, better fitted the work for permanent favor. It will remain necessary to the student until another historian, with equal or better facilities, shall rewrite the story in a way to gain wider sympathy. Present tendencies and methods in historical study and writing give little evidence that such another will soon arise. His lesser works include 'Poems' (1823); 'Literary and Historical Miscellanies' (1855); 'Memorial Address on the Life of Lincoln' (1866); 'Joseph Reed: a Historical Essay' (1867); 'A Plea for the Constitution of the United States Wounded in the House of Its Guardians' (1886); 'Necessity, Reality, and Promise of the Progress of the Human Race' (1854); 'Oration, 4 July 1826, Northampton, Mass.'; 'Oration Before the Democracy of Springfield, Mass., 4 July 1836'; 'Address at Hartford, Conn., 18 Feb. 1840'; 'History of the Formation of the Constitution of the United States' (1882); 'Oration Delivered at the Commemoration, in Washington, of the Death of Andrew Jackson, 27 June 1845.' To the American Encyclopædia he contributed the article on Jonathan Edwards. See Green, 'George Bancroft' (1891); Wallis, 'Mr. Bancroft as a Historian' (1896); West, 'George Bancroft' (1900).

Bancroft, Hubert Howe, American historian: b. Granville, Ohio, 5 May 1832. In 1852 he went to California to establish a book business, and began to collect documents, maps, books and MSS. for a complete 'History of the Pacific States' from Mexico to Alaska. In 1893 this library numbered 60,000 volumes, to which many additions have been made. His histories are still in preparation. 'Literary Industries' (Vol. XL., San Francisco, 1890) describes his work.

Bancroft, Marie Effie Wilton, English actress, wife of Sir Squire Bancroft (q.v.). She appeared on the stage when a child, and acted in several places before making her London début. In London she won great popularity in several plays, particularly in 'The Maid and the Magpie' at the Strand. In 1865 she became a partner in the management of the Prince of Wales' Theatre, and obtained Squire Bancroft (afterward her husband) as leading man. Since then she has been associated with him as manager and actress.

Bancroft, Richard, English archbishop: b. Farnworth, Lancashire, 1544; d. 1610. He studied at Cambridge, entered the Church, and rose rapidly during the reign of Elizabeth till he obtained the see of London in 1597. After her death James I. made him archbishop of Canterbury on the death of Whitgift. He possessed good talents, and was distinguished as a controversialist, a preacher, and a politician. The greatest blot on his memory is the rigor with which he treated the Puritans.

Bancroft, Sir Squire, English actor: b. 1841. He began his career in Birmingham in 1861, and played at Dublin and Liverpool. In 1865 he made his first appearance at the Prince of Wales' Theatre, and continued there several years as leading man in a series of comedies depicting modern life, among which are: 'Society'; 'Caste'; 'Play'; 'School'; and 'M. P.' In 1880 he moved with his wife to the Haymarket Theatre, where he continued presenting the same line of plays. Since 1885 he has ap-

peared but little, though he took part in 'Diplomacy' at the Garrick Theatre in 1893.

Bancroft, Wilder Dwight, American chemist: b. 1867. He was educated at Harvard and abroad, and obtained the degree of Ph.D. at Leipsic. He was instructor of chemistry at Harvard 1894–5; was appointed assistant professor of chemistry at Cornell in 1895. In the same year he founded the 'Journal of Physical Chemistry' and became its editor.

Bancroft, William Amos, American railway president: b. Groton, Mass., 26 April 1865. He was graduated from Harvard University 1878, Harvard Law School 1881, and was admitted to the Suffolk bar 1881. He was elected mayor of Cambridge in 1893 and has occupied many positions of political importance. He is also director in many educational and financial institutions.

Band, in music, a number of trained musicians in a regiment, intended to march in front of the soldiers and play instruments, so as to enable them to keep step as they move forward; also any similarly organized company of musicians, though unconnected with the army; an orchestra. The word is also applied to the subdivisions of an orchestra, as string-band, wind-band, etc.

In architecture, any flat fascia or ornament which is continued horizontally along a wall, or by which a building is encircled. Bands often consist of foliage, quatrefoils, or of simple bricks. Band of a shaft is the molding or suits of moldings by which the pillars and shafts are encircled in Gothic architecture. Several bands are often placed at equal distances on the body of the shaft, when it is long, in which case they are known as shaft-rings.

As vestment, bands are linen pendants from the neck, forming part of clerical, legal, and academic costume. It is a moot question whether they are a survival of the amice, or immediate descendants of the wide falling collar which was a part of the ordinary civilian dress in the reign of James I. In the Anglican Church they are seldom worn, except by ultra-low Churchmen; but they are in common use with Presbyterian ministers (ordained ministers as distinguished from licentiates). Foreign Catholic ecclesiastics wear black bands with a narrow white border.

Band-fish, a genus in the family *Cepolidæ,* having the body much elongated and compressed, and is covered by very small scales. The dorsal fin is very long, and consists like the anal of soft rays. The tail vertebræ are very numerous, and the whole structure of the body exhibits unusual delicacy, so that specimens are seldom obtained in an uninjured state. All the species inhabit quiet depths, and are unable to contend with waves and currents. The snake-like form and the beauty of their colors make them objects of great interest. One species, the red band-fish (*C. rubescens*), not uncommon in the Mediterranean, is occasionally cast ashore by storms on the British coasts. It is about 15 inches long. Its brilliant appearance, when seen moving in the water, has suggested the names of fire-flame and red ribbon, by which it is known at Nice. The home of the genus is in Japanese waters. See Oar-fish.

Band of Hope Union, an association of the children's temperance societies of Great Britain, having upward of 15,000 allied associations, with a membership of 2,000,000.

Band Saw Blades. Owing to the increased value of timber in America more and more attention has been paid to the economical conversion thereof into the sawn product ready for market. The methods in use a few years ago were found to be wasteful and usually crude, and the product turned out of but an indifferent quality so far as sawing was concerned.

The attention of the operator being directed to band saw blades, these have come into quite general use for various purposes. A test of the band saw blade has proven its advantages to be so great that it has displaced not only the small scroll or "jig" saws for bracket sawing and ornamental scroll and curved work, but has also displaced reciprocating saws and circular saws for heavier work.

A band saw consists of a thin band or ribbon of steel with teeth cut in one edge, and when in use it is mounted on two wheels like a belt and made to travel at a rapid rate of speed by revolving the wheels. For scroll work its advantage over the reciprocating and jig saw lies mainly in the increased and uniform speed at which the saw blade travels which enables the operator to better control the work in hand and to feed the material toward the saw constantly, and thus to turn out more and better work than would be possible with a reciprocating saw cutting on the downward stroke only.

In sawing logs the advantage of a band saw as compared with a reciprocating saw may be judged when we state that the band saw blade travels at a rate of from 8,000 to 10,000 feet per minute, whereas, a reciprocating saw making 200 strokes of 18 inches to the minute, would only have a cutting speed of 300 feet per minute. The band saw traveling more than 20 times as fast as the reciprocating saw, will naturally perform nearly or quite as much work as 20 reciprocating saws. The single reciprocating saw, which evidently was the primitive saw mill, because of its limited capacity was succeeded by what is termed in the United States a gang, in Europe, a log frame, and in Canada a gate. The gang saw mill for log sawing consists of a sufficient number of reciprocating saws placed side by side in a frame to saw completely at the one operation an entire log. The advantage of the band log mill over the gang lies in its adaptability to the sawing of each log to the best advantage; as but one cut is made at a time, and as the face of the log is exposed to the view of the sawyer, he can judge through what portion of the log the next cut should be made to yield the best results.

Another form of saw mill is that known as the rotary mill or circular saw mill. Both the circular and band log mills are provided with traveling carriages on which the log is placed, secured and fed past the saw. The circular saw has possibly as great a capacity as the band, but it is very wasteful, because a circular saw large enough to saw plank from the side of a log of medium size needs be of such large diameter that in order to support it in the cut the saw is made very thick, and thus removes an immense saw kerf. Not only this, but it has been found impossible to saw with this kind of mill with sufficient accuracy to meet the pres-

ent market requirements. The circular saw while popular in the past is known to have wasted nearly or quite 25 per cent of the product of the log in saw kerf and poorly sawn timber. The band saw, on the other hand, combines the accuracy of the reciprocating saw with the capacity of the circular saw. The success of the band saw is due: first, to the acquired skill of the saw maker in turning out saw blades of suitable temper to retain a good cutting edge and at the same time flexible enough to pass over the wheels without cracking; second, to the skill of the saw filer in fitting his saws. Band saws require to be "tensioned" from time to time when in use. By the word tension is meant the expanding of the central portion of the saw blade either by the use of a hammer and anvil or by the use of what is termed stretching rolls.

The use of the band saw has also brought forth an extensive line of saw fitting tools such as saw "swages" which are designed to expand the points of the teeth, "pressure side dressers" or "tooth formers" or "shapers" which are intended to give form to the swaged points of the teeth, automatic saw sharpeners, etc. With the use of these improved appliances it was found that thinner and thinner band saw blades could be used, and hence the band saw has come into general use for "resawing purposes," that is, the sawing of planks and boards into two or more thinner pieces. For this purpose it is well adapted. The plank or boards to be resawn are fed to the saw by means of rollers. Saws as thin as .02 of an inch in thickness are successfully used. Such saws remove a saw kerf of practically one thirty-secondth of an inch. The advantage of the band resaw lies in the fact that it is practical to use the thinnest and most delicate saw of this type and still have it of practical use and service as a tool.

EDWARD C. MERSHON,
Of W. B. Mershon & Company, Saginaw, Mich.

Ban'da, a town of India, in the northwest provinces, capital of a district of the same name, on an undulating plain near the Ken River, 95 miles southwest of Allahabad. It is a straggling, ill-built place, but with clean streets, and contains a large number of mosques and temples. It was formerly an important cotton market. There are cantonments about a mile distant from the town. Pop. (1900) 29,000.

Banda Islands, a group belonging to Holland, in the Indian Archipelago, south of Ceram; the largest, Great Banda, being 12 miles long by 2 broad, while Goenong Api is an active volcano nearly 8,000 feet high. They have a rich soil admirably adapted for the cultivation of the nutmeg, which is their chief product, others being cocoanuts and sago. The total area of the group is about 19 square miles and the capital of the group is Banda, the seat of the assistant resident. Tatti wood is grown on the island of Rosingen. Pop. about 8,000, of whom less than 600 are Europeans.

Banda Oriental, a state of South America, originally settled by Spaniards from Buenos Ayres, claimed by Brazil, but, after a war, made in 1825 into the independent State of Banda Oriental del Uruguay — that is Eastern Bank of the Uruguay, now usually called simply Uruguay (q.v.).

Bandage, a surgical wrapper applied to some part of the body. Bandages are employed for a variety of purposes. One of their chief uses is to secure dressings or splints. Another is to give support to a limb or to restrain its movements, or to exert pressure upon it so as to aid in restraining bleeding at some point; or a bandage may be used to promote healing, as in the case of ulcers, or to aid in the removal of swelling. In these latter cases the bandage must be applied with a considerable degree of tightness, and great care must be exercised that it be evenly put on, and that the tightness with which it is drawn does not give rise to disturbances of the circulation by undue and irregular pressure. Suppose, for instance, the arm is being bandaged from the hand well up over the upper arm. The arteries which carry the blood down the limb are for the most part deeply seated and well protected by muscles, so that they are practically unaffected by any ordinary degree of pressure on the surface. But many of the veins which carry the blood back to the heart up the limb run immediately under the skin, and will be pressed upon considerably by a bandage applied round the arm. If the bandage is made too tight at the elbow, say, the veins will be compressed and the blood will flow less easily along them at that point than it does lower down where the pressure is less. The consequence will be that the blood will be hindered in passing up from the hand; and as blood is all the time being carried down to the hand in the arteries, which are unaffected, the veins in the forearm and hand will become swollen and gorged with blood. The pressure of blood in the veins will become so great that fluid will be pressed out of the finer vessels into the surrounding tissues, and the hand will become swollen, puffy, and dropsical, while much pain will be experienced. If the tight turns of the bandage are now loosened, the veins will again offer a free passage to the blood, and the swelling and pain will gradually subside. The proper method in such a case is not necessarily to bandage loosely, but to bandage uniformly, beginning with the requisite degree of tightness at the very extremity of the limb, and continuing evenly and regularly upward. A general rule in bandaging a limb, then, is: never let the bandage be tighter up the limb than it is at the extremity; apply it firmly and evenly at the extremity and carry it up uniformly. To this may be added, as a second rule, that if a bandage requires to be tightly applied in the course of a limb it must be begun at the extremity. It is specially necessary to follow these rules when the bandage is applied to secure a splint, since it must be tight enough to keep the splint in accurate position, or to keep a pad firmly applied over a wound for the arrest of bleeding. Bandages usually consist of strips of unbleached or bleached calico, linen, flannel, muslin, etc. Elastic bandages and india-rubber bandages are also in use for particular cases. The material should be torn into strips of the requisite breadth, and the bandages should have no hem or edging, as this would prevent them stretching equally in all directions. The strips should be rolled up for use into firm rollers, a roller bandage being usually 6 yards long, though often more. They are of different breadth, most commonly 2½ or 3½ inches. For the chest and abdomen the breadth should be 4½ inches; for

the fingers three-quarters of an inch. The triangular bandage is of all others the one made use of for rendering temporary aid in cases of accident, and, through the training afforded by "first aid to the injured" associations, is now familiar to almost everyone. The bandage is made of a square yard of linen or calico halved diagonally, each half having of course two sides 36 inches each in length, with a base of fully 50 inches. When it is desired to exert very considerable pressure upon a part for a length of time, or when it is desired to keep a limb or a joint motionless for some time, this may be done without the use of splints by stiffening the bandage with starch or plaster of Paris.

Bandai-San, bän'dī-sän', Japan, a volcano on the island of Nippon, 140 miles north of Tokio. Its summit consists of several peaks, the highest of which is 6,035 feet above the ocean and 4,000 feet above the surrounding plain. On 15 July 1888 there was a terrible explosion of steam which blew out a side of the mountain, making a crater more than a mile in width, and having precipitous walls on three sides. The débris of broken rock and dust poured down the slope and over an area of 27 square miles, killing 461 persons and covering a number of villages.

Bandajan', a pass over a range of the Himalayas, in Cashmere, 14,854 feet above sea-level.

Bandan'a, a cotton handkerchief, having a dark ground of Turkey-red, blue, or purple, variegated with simple patterns of white or bright yellow, their bright colors making them a favorite head-covering for southern negro women. These handkerchiefs were originally manufactured in the East Indies; but the beauty and durability of their colors caused such a demand that the manufacture of them was established elsewhere. The process is first to dye the cloth of a dark color, commonly Turkey-red, which serves as a ground. The white spots constituting the pattern are afterward produced by discharging the color with a solution of chlorine. In order to confine the discharging fluid to the exact points to be operated upon, the pattern is cut out in leaden plates, upon which the fluid will not act, and as many handkerchiefs or pieces of cloth as are to be operated upon are enclosed between pairs of these patterns, and subjected to enormous pressure, the discharging fluid being run in at the top and prevented by the pressure from spreading, so that the pattern is brought out clean on the spots subjected to the action of the fluid.

Bande Noire, bänd nwär, an appellation given during the French Revolution to companies of capitalists and speculators who bought up the forfeited estates of the Church and nobility. They were considered by many as hordes of Vandals bound to destroy the monuments which kings, nobles, and religious orders had erected all over France; and thence the scornful denomination, which was continued nearly up to 1830. But while the Bande Noire removed some castles and monasteries which ought to have been preserved as relics of art and religion, they did much toward the prosperity of the country by improving unproductive lands and disseminating among the people landed property which previously was concentrated in the hands of privileged classes. The term was originally applied to a body of German soldiers who were employed in the Italian wars by Louis XII. of France, and who received the name from carrying black colors after the death of a favorite commander. The appellation was also assumed for the same cause by different Italian and French troops in the 16th century.

Ban'ded Peak, or **Mt. Hesperus,** a summit of the San Juan Mountains, in southern Colorado; altitude, 12,860 feet.

Bandel, bän'dĕl, **Ernst von,** Bavarian sculptor: b. Ansbach, 1800; d. near Donawörth, 25 Sept. 1876. He studied art at Munich, Nuremberg, and Rome; and from 1834 lived chiefly at Hanover, engaged off and on, for 40 years, on his great monument of Arminius, near Detmold, 90 feet high, which was unveiled by the Emperor Wilhelm 16 Aug. 1875.

Bandelier, bän-dĕ-lēr, **Adolph Francis Alphonse,** Swiss-American archæologist: b. Berne, 6 Aug. 1840; settled early in the United States, where he has done important work under the direction of the Archæological Institute of America. His studies have been chiefly among the Indians of New Mexico and Arizona, Central America, and Mexico. He has published many papers on the subject. He is also the author of 'Art of War and Mode of Warfare' (1877); 'Social Organization and Government of Ancient Mexicans' (1878); 'Tenure of Lands and Inheritances of Ancient Mexicans' (1878); 'An Archæological Tour into Mexico' (1885); a novel of Pueblo Indian life, 'The Delight Makers'; etc.

Bandello, bän-dĕl'ō, **Matteo,** Italian novelist: b. about 1480; d. 1561. He studied at Rome and Naples and applied himself almost exclusively to polite literature. In his youth, he was a Dominican monk, and was entrusted with the education of the celebrated Lucrezia Gonzaga. After the battle of Pavia he was banished from Italy as a partisan of the French, and Henry II. of France gave him in 1550 the bishopric of Agen. He left the administration of his diocese to the Bishop of Grasse, and employed himself, at the advanced age of 70, in the completion of his novels, of which he published three volumes in 1554; a fourth was published in 1573, after his death, which took place in 1561. He also published some poems. His novels are in the style of Boccaccio and are characterized by even greater license.

Ban'deras, Rio de, a river of Mexico, on the east coast; so called (river of flags) because, when discovered in 1518 by Juan de Grijalva, the natives waved white flags at the end of their spears in token of friendship.

Bandettini, bän-dĕt-tē'nē, **Teresa,** Italian poet: b. Lucca, 12 Aug. 1763; d. 1837. Beginning life as a danseuse, she discovered her poetic talent as if by accident, and came to be known and honored in most parts of her country. She was especially gifted in improvising verse. She was called the Amarilla Etrusca. Of her finished poems there remain 'La Morte de Adanoide'; 'Il Polidoro'; 'La Rosmunda'; and some shorter pieces.

Ban'dicoot. 1. A large dark-colored rat (*Nesokia bandicota*) of southern India and Ceylon, where it is known as the "pig-rat" on account of the taste of its flesh, which is a favorite article of food among the natives of the

dry, hilly districts it frequents. As its food is chiefly grain and roots it does much harm to gardens; and it is also destructive to poultry. It has the habit of storing rice in its underground nests against the famine of the dry season.

2. In Australia, a small marsupial with a long, narrow head and muzzle belonging to the family *Peramelidæ*. Many species are scattered throughout Australasia. They live in warm nests underground, and feed upon insects, worms, and vegetable food. The hare-like marsupials of the closely allied genus *Perogale* are known as rabbit-bandicoots, and, like the other, frequently injure vegetable gardens. Consult Gould, 'Mammals of Australia' (London 1863).

Bandiera, băn-dĭ-ā'ra, **Attilio** and **Emilio,** two brothers of a Venetian family, lieutenants in the Austrian navy, who attempted a rising in favor of Italian independence in 1843. The attempt was a failure, and they fled to Corfu; but, misled by false information, they ventured to land in Calabria with 20 companions, believing that their appearance would be the signal for a general insurrection. One of their accomplices had betrayed them, and the party was captured at once by the Neapolitan police. Attilio and Emilio were shot, along with seven of their comrades, in the public square of Cosenza, 25 July 1844.

Bandinelli, băn-dē-nĕl'-lē, **Baccio,** Italian sculptor: b. Florence, 1493, the **son of a goldsmith**; d. 1560. He learned his art under the sculptor Rustici, but modeled his style after that of Michael Angelo, whom he vainly attempted to rival and whom he hated with lifelong hatred. He was patronized by the Medici, and in honor of the presence of Leo X. in Florence he executed the model of a colossal statue of Hercules which was intended to surpass the David of Michael Angelo. Another work of his was an inferior copy of the Laocoon group for Francis I. He produced also Hercules and Cacus (at Florence), a somewhat heavy work, 88 figures of apostles, prophets, and saints in the choir of the cathedral at Florence, a Bacchus, an Adam and Eve, etc.

Ban'dit (It. *bandito*), originally an exile, banished man, or outlaw; and hence, as persons outlawed frequently adopted the profession of brigand or highwayman, the word came to be synonymous with brigand. Of all European countries Italy has perhaps been most infested with banditti. They used to form a kind of society of themselves, subjected to strict laws, and living in open or secret war with the civil authorities. Peter the Calabrian, the most terrible among these robbers, in 1812 named himself, in imitation of the titles of Napoleon, "emperor of the mountains," "king of the woods," "protector of the conscribed," and "mediator of the highways from Florence to Naples." The government of Ferdinand I. was compelled to make a compact with this bandit. One of the robbers entered the royal service as a captain in 1818 and engaged to take captive his former comrades. Subsequently adventurers of all kinds united with them. The Austrian troops which occupied Naples were obliged to send large detachments to repress them. The bandits used to exact from strangers and natives a sum of money for protection, and give them in return a letter of security. In Sicily the Prince of Villa Franca declared himself, from political and other views, the protector of bandits; he gave them a livery and treated them with much confidence, which they never abused. Banditti are still active in Italy, Sicily, Turkey, and elsewhere.

Bandolier', a large leathern belt or baldrick, to which were attached a bag for balls and a number of pipes or cases of wood or metal covered with leather, each containing a charge of gunpowder. It was worn by ancient musketeers, and hung from the left shoulder under the right arm with the ball bag at the lower extremity, and the pipes suspended on either side. The name is now given to a similar belt by which a number of cartridges are conveniently carried.

Bandon, a river of Ireland which rises in the Carberry Mountains, and at its mouth forms the harbor of Kinsale. Spenser describes it as "the pleasant Bandon, crowned by many a wood." It has a course of 40 miles, for 15 of which it is navigable to Innishannon, four miles below Bandon.

Bandtke, bänt-kĕ, or **Bandtkie, Jerzy Samuel,** Polish historian: b. Lublin, 24 Nov. 1768; d. Cracow 11 June 1835. He was author of 'History of the Polish Nation' (1820), and professor in the University of Cracow, 1811–35.

Bane'berry. See ACTÆA.

Banèr, bā-nār', **Johan Gustafsson,** Swedish general in the Thirty Years' war: b. 1596; d. 1641. He made his first campaigns in Poland and Russia, and accompanied Gustavus Adolphus, who held him in high esteem, to Germany. After the death of Gustavus in 1632 he had the chief command of the Swedish army, and in 1634 invaded Bohemia, defeated the Saxons at Wittstock, 24 Sept. 1636, and took Torgau. He ravaged Saxony again in 1639, gained another victory at Chemnitz, and in 1640 defeated Piccolomini. In January 1641 he very nearly took Ratisbon by surprise.

Banez, Dominic, theologian: b. 1528 in the Spanish province of Biscaya; d. 1604 at Medina del Campo. He made rapid progress in philosophy and theology at the University of Salamanca, where he had as teachers the famous Melchior Cano and Peter and Dominic Soto. In 1581 he was appointed professor in this university, which was then dividing the honors and prestige of the Sorbonne. He was recognized as one of the clearest and most acute interpreters of the 'Summa' of Saint Thomas, and his chief works were commentaries on the same. He took a prominent part in the controversy on Divine Grace, predestination, etc., in which he opposed the theories of Molina. For several years he acted as confessor to Saint Theresa, and at his command she wrote her spiritual treatise, 'Camino de Perfeccion.'

Banffshire, Scotland, a county in the north, bounded on the north by the Moray Firth, on the west by the county of Moray and part of Inverness, on the south and east by the county of Aberdeen. The soil is for the most part a rich loam or deep clay. The principal rivers are the Spey and Deveron, with the Isla, a tributary of the former, and the Avon and Fiddich of the latter; besides which there are many other main and tributary streams. The

mountains rise in altitude as they recede from the sea, the most celebrated being Cairngorm, which is 4,095 feet high. The principal crops are barley, oats, turnips, and potatoes, little wheat being raised. Special attention is paid to the cultivation of turnips, the chief object of the farmer being the rearing and feeding of cattle. The total area of Banffshire is 410,000 acres. Nearly two fifths of the total surface is under cultivation, and about one fifth is occupied by woods and plantations. Since about the middle of the 19th century large tracts of formerly waste land have been reclaimed. Fishing is a staple industry. The salmon caught in the Spey and Deveron constitute an important article of traffic, the valued rental of the Duke of Richmond's salmon fishings in the former being over $60,000 a year. Banffshire possesses several woolen factories, tanneries, rope and sail works, ship-building yards, breweries, lime-works, and many distilleries, the whiskey being generally known under the name of Glenlivet, after a glen in the county. Among the natural productions limestone is the most prevalent. Serpentine also abounds in several places, especially at Portsoy, where it is known as «Portsoy marble»; it is wrought into vases and other ornaments. Ironstone and manganese also occur, and Scotch topazes or cairngorm stones are found on the mountains in the south of the county. Pop. (1901) 61,439.

Bang, bäng, **Hermann Joachim,** Danish novelist: b. 1857. He came into notice about 1879, since which time he has published a number of novels and some poems. 'Hopeless Generations' (Haablose Slœgter); 'Eccentric Tales' (Excentriske Noveller); 'Under the Yoke' (Under Aaget); 'Ten Years' (Ti Aar); and 'By the Roadside' (Ved Veien), are the titles of some of them. The last named is considered the masterpiece.

Bang, a drink. See BANGUE.

Bangalore, bän-gą-lōr', a town of Hindustan, capital of Mysoer, 70 miles northeast of Seringapatam. It stands on a plateau 3,000 feet above sea-level, and is divided into two parts, the old native town and the cantonments. The chief buildings are the government house (where the British resident lives), the new public offices, the palace of the maharajah, the central jail, etc. There is a fine public pleasure-garden. In the old town stands the fort, reconstructed by Hyder Ali in 1761, and captured by Lord Cornwallis in 1791. Latterly the town has greatly prospered. There are manufactures of silks, cotton cloth, carpets, etc. Bangalore is noted for its salubrity. Pop. (1901) about 160,000.

Bange, bäñzh, **Valerand de,** French artillery colonel: b. Balignicourt, 1833. In 1873 he reconstructed both the light and heavy field pieces of the day, and his models were adopted by the French army in 1879. In 1884 he was the successful competitor with Krupp for the contract to supply field pieces to the Servian government. His gun has been preferred also by England, Sweden, and Italy. He was the first to employ effectively the screw principle in the mechanism of the breech block. See Hennébert, 'L'Artillerie Krupp et l'Artillerie de Bange' (1886).

Bangkok', or **Bankok,** the capital of the kingdom of Siam, extending for 3 or 4 miles on both sides of the Menam, which falls into the Gulf of Siam about 15 miles below. It consists of three parts — the town proper, the floating town, and the royal palace. The town proper occupies an island 7 or 8 miles in circuit, and is surrounded with walls and bastions; situated in the midst of gardens and luxuriant foliage it presents a very picturesque appearance. The floating town consists of wooden houses erected on bamboo rafts moored to the bank in rows eight or more deep. The palace, occupying an island in the river, is surrounded by high walls. Though the general character of the buildings is not imposing, numerous temples, glittering with gilding and terminating in lofty spires, are seen in many quarters. The trade, both inland and foreign, is very extensive. The population is about 800,000, nearly half of whom are Chinese, the others including Burmese, Annamese, Cambodians, Malays, Eurasians, and Europeans. The foreign trade of Siam centres in Bangkok and is mainly in the hands of the Europeans and Chinese. The approach to Bangkok by the Menam, which can be navigated by ships of 350 tons' burden (large sea-going ships anchor at Paknam, below the bar at the mouth of the river), is exceedingly beautiful. As the town is neared, numerous temples present themselves, and floating houses become common; and finally the whole city, with its rich gardens and shining temples and palaces, bursts full upon the view. Stone buildings are used only for the royal palaces, some noblemen's houses, monasteries, and the dwellings of Europeans. A large number of the houses float on rafts fastened by ropes to poles; most of the trade of the city is carried on upon the river. The internal traffic of Bangkok is chiefly carried on by means of canals, there being only a few passable streets in the whole city. Horses and carriages are rarely seen, except in the neighborhood of the palaces. The native houses on land,— of bamboo or other wood, like the floating houses,— are raised upon piles, six or eight feet from the ground, and are reached by ladders. The circumference of the walls of Bangkok, which are 15 to 30 feet high and 12 broad, is about 6 miles. Bangkok is the constant residence of the king. The palace is surrounded by high walls and is nearly a mile in circumference. It includes temples, public offices, accommodation for officials and for some thousand soldiers, with their necessary equipments, a theatre, apartments for a crowd of female attendants, and several Buddhist temples or chapels. Several of the famous white elephants are kept in the courtyard of the palace. Throughout the interior are distributed the most costly articles in gold, silver, and precious stones. The temples of Bangkok are innumerable, and decorated in the most gorgeous style, the Siamese taking a pride in lavishing their wealth on them. In the neighborhood of Bangkok are iron mines and forests of teakwood. The chief exports are rice, sugar, pepper, cardamoms, sesame, hides, fine woods, ivory, feathers, and edible birds' nests. The imports are tea, manufactured silks, and piece goods, opium, hardware, machinery, and glasswares. The United States has a resident consular agent. Among recent evidences of progress may be mentioned the erection of steam mills, the introduction of gas into the royal palaces and many noblemen's houses, and the estab-

lishment of a regular mail to Bangkok in 1884. Siam joined the International Postal Union in 1885, and in 1890 a parcel post service (with Singapore and Europe) was established. Bangkok is now connected with Burma and Cambodia by telegraph, and is the centre of a local system of (in 1893) 1,780 miles. A short railway at Paknam (on the coast) was opened in 1893; another line of 165 miles is being made; and others to the northern provinces have been surveyed and sanctioned. In 1893 a treaty was concluded at Bangkok, by which Siam made large cessions to France, two French gunboats having forced their way to the capital after an ineffective defense.

Ban'gor, Ireland, a seaport town, county Down, situated on an acclivity on the south side of Belfast Lough, four miles northwest of Donaghadee. It consists of three principal and several smaller streets, and has an Episcopal church, a Methodist and a Roman Catholic chapel, and two Presbyterian churches; an endowed school, six national schools, a Protestant hall, and a branch of the Belfast Bank. The male population is chiefly employed in seafaring pursuits, the females in hand-sewing in all its branches. Bangor is a favorite bathing resort. Bangor Abbey was founded by Saint Congall in 555 A.D., and was destroyed by the Danes in the 9th century. The parish church now occupies the site. Pop. in 1891, 3,834.

Bangor, Maine, the chief city of eastern Maine, is a port of entry and the seat of Penobscot County. The city is on the west bank of the Penobscot River, across its affluent the Kenduskeag, and at the head of navigation, about 28 miles from Penobscot Bay. It is on the Maine Central, Bangor & Aroostook and several other railroads, with steam and electric lines radiating in all directions; is on the main line from Boston to Saint John and Halifax, and also has direct steamship connection with Boston, being the terminus of the Bangor Division of the Eastern Steamship Company. Bangor is 76 miles northeast of Augusta, 137 miles northeast of Portland and 246 miles from Boston.

Trade and Commerce.— Situated near the geographical centre of Maine and at the head of navigation on the largest river of the State, Bangor occupies a highly favored position and one destined to be even more commanding with the growth and development of the expansive territory north and east and tributary to her. As the shire town of a county embracing some 75,000 inhabitants, as the trade centre and shipping point of a large and rich agricultural section and for many thriving industrial communities; as a point of convergence for numerous important railway and steamship lines, and a consequent tarrying place for great numbers of tourists, sportsmen and commercial travelers; these together with the busy commerce of its port, the metropolitan character of its hotels and the compactness of its business section, give to the city a much more populous appearance than the above figures would indicate. Bangor has a fine harbor, easily accessible for vessels of large size; and the scene in the open season along the docks, where crafts of varying rig are loaded with lumber, ice and the diversified products of this region, is an animated one. Although nearly 30 miles from the bay and 60 miles from the ocean, the tide rises about 17 feet, and there is a sufficient depth of water to float the largest of ocean steamships. The Penobscot River, whose waters unite with those of the bay of the same name, is a noble water highway, rising 300 miles away amid the mountains and forests of northwestern Maine. In the 8,200 square miles drained by the Penobscot there are 1,604 tributary streams indicated on the State map, and 467 lakes and ponds. Bangor is one of the greatest lumber markets in the north, there being tributary to the city the great forests of spruce traversed by the Penobscot and down which the logs are floated; and has every sort of manufactory of wood and allied products,— saw, planing, woodpulp, and molding mills; factories of furniture, carriages, trunks, valises, agricultural implements, boots, shoes and moccasins, clothing, dairy products, etc., with iron foundries, machine shops, shipyards, flour mills and pork-packing establishments. Ice-cutting is also an important industry, Penobscot ice being exceptionally pure.

Manufactures and Industries.—Bangor's manufacturing establishments number in the vicinity of three hundred, embracing about one hundred different kinds of industries and employing several thousand hands. These figures are, however, inadequate to correctly portray the city's manufacturing interests, as many of the most important establishments, including all the large saw mills but one, are outside the city's limits. Therefore, while the manufactures of these mills are purely Bangor products, the plants themselves and most of the employees belong properly to other towns. Among Maine's many industries the lumber trade still holds a foremost place. From 1816, in which year about a million feet were cut, down to the present time, there have been cut on the Penobscot waters in the vicinity of 11,000,000,000 feet. The lumber cut on the Penobscot and its tributaries during the winter of 1903–4 aggregated about 210,000,000 feet. Lumber shipments from the port of Bangor during 1903 were 156,509,108 feet against 124,767,646 feet in 1902, and 120,954,897 feet in 1901. In recent years pulp and paper manufacturing has made great advance and numerous pulp and paper mills are now in operation along the Penobscot, from those of the Eastern Manufacturing Company at South Brewer to the immense plant of the Great Northern Paper Company at Millinocket.

In recent years diversified manufactures have been multiplying and many and varied are the products of these establishments. Bangor has one of the largest and most prosperous shoe factories in the State. Here is located a trunk manufacturing establishment which shipped recently a whole trainload of trunks, the largest shipment of trunks ever made by one manufacturer in this country or the world. There are located here great wood-working plants from whence go all over the country the finest designs in interior decorations and architectural wood-working.

Bangor is a trade centre for eight counties, and is connected with their principal places by steam or electric roads, or by water communication. As indicative of the volume of the city's commerce the Bangor Customs District reports the exports for the fiscal year ending 30 June 1903 as $5,372,939, against $4,248,430 in 1902, and $4,170,982 in 1901. The imports for the fiscal

year ending 30 June 1903 were $1,341,880. In 1903 for the first time in its history the United States Bureau of Statistics reports a shipment to the Midway Islands, located in the distant Pacific, midway between Honolulu and Guam, and it is interesting to note that these goods were shipped from the Bangor Customs District. Exports by vessel from the port of Bangor consist chiefly of fruit box shooks to the Mediterranean, spool bars to Scotland and deals to South America and the United Kingdom. The coal receipts in the port of Bangor aggregated 365,720 tons in 1903 and there were 273 cargoes.

Banks, etc.— Bangor has five national banks, two savings banks, two trust and banking companies, two loan and building associations and two marine insurance companies. There are two daily papers and several weekly and monthly publications. There is a board of trade with attractive rooms at the city hall. The Kenduskeag, flowing through the centre of the city, is spanned by several bridges, and the city is connected with Brewer across the Penobscot by a bridge 1,300 feet long. A dam across the Penobscot just above the city furnishes water supply and power, the city owning both its waterworks and municipal lighting plant. The assessed property valuation of Bangor is $16,345,000, with a total debt of less than $1,000,000.

Buildings, etc.—The city has a fine granite custom house and post-office and the recently completed county court-house is a handsome and commodious edifice, a credit to the great county of Penobscot, of which Bangor is the shire town. Bangor's city hall — the Hersey memorial building — is an imposing edifice which reflects credit upon the city. The Bangor public library is one of the foremost institutions of its kind and contains on its shelves upwards of 50,000 volumes. The Bangor opera house is unsurpassed for its beauty and appointments by any outside the largest cities. The Bangor Auditorium Association has erected the largest building of its kind in the State, and here each fall are held the eastern Maine musical festivals. The Eastern Maine General Hospital is one of the important institutions here and Bangor is also the home of the Eastern Maine Insane Hospital. The Bangor Theological Seminary is a time-honored institution of learning, and only nine miles away, in the town of Orono, is the flourishing University of Maine.

Government.— Bangor received a city charter 12 Feb. 1834. The city seal is typical, the rising sun in the background illustrating the Sunrise State, and the spruce tree in the centre portraying the great lumber interests, while in the immediate foreground are gear wheel, anchor and plow, emblematic of manufactures, commerce and agriculture. The government is vested in a mayor, who is elected annually, and a council divided into two chambers. The city has seven wards, and one alderman and three councilmen are chosen annually from each ward, the city government comprising the mayor, seven aldermen and twenty-one councilmen. Most of the appointments and administration offices are subject to the control of the mayor and city council.

History.— Bangor's present site was in the early days the camping-ground of the Tarratines, a famous tribe of Indians. It was in 1769 that Jacob Buswell, Bangor's first white settler, came here from Massachusetts. He was a hunter and boatbuilder, and established his home near the site of Saint John's Roman Catholic Church. The place was for a time known as Kadesquit, afterwards as Condeskeag, and later as Kenduskeag. The locality had been visited by the French as early as 1605, and was one of the many places identified with the mythical Norumbega. Kenduskeag plantation was only a small hamlet at the time of the Revolution and during the time when the British had control of the river the hardships were severe. At the instigation of Rev. Seth Noble, Bangor's first clergyman, the name of Kenduskeag was finally abandoned and Sunbury adopted. With the growth of the place the people became impatient of the plantation organization and delegated Parson Noble to proceed to the General Court at Boston and secure an act of incorporation. Minister Noble was a great lover of music, and the hymn tune of Bangor was such a favorite with him that that name was substituted for Sunbury and the act incorporating the town of Bangor was passed 25 Feb. 1791.

Bangor early gave attention to the matter of improving her transportation facilities, and she had her railroad when most of the proud cities of to-day knew nothing of such things. As early as 1836 her enterprising citizens built a railroad to Old Town, a dozen miles up the river, with a view of aiding the development of her natural resources; and this, one of the earliest railroads in America, prospered for nearly a third of a century. Not only did the city have one of the first railroads in the country, but the pioneer iron steamship constructed in America was built to run to this port and bore the name Bangor. She was built in 1845 on the Delaware, her owners being the Bangor Steam Navigation Company of Maine, and she was designed for passenger and freight service between Boston and Bangor. Within recent years, through the enterprise of some of Bangor's public spirited men, Aroostook County has been brought into direct railroad communication with Bangor through the construction of the Bangor & Aroostook railroad, this system having numerous branches to important points in northern Maine, it having also absorbed the Bangor & Piscataquis railroad. In recent years there has been no more important railroad enterprise inaugurated in New England than that of the Bangor & Aroostook, and under its enterprising and progressive management it has become a potential factor in the development of Bangor and the immense territory stretching to the northward. Bangor business men, ever alert to adopt the newest methods, inaugurated in this city the first electric railroad in Maine and more recently electric roads have been constructed reaching Hampden and South Brewer on the south and Old Town and Charleston on the north. These electric lines bring Bangor and the territory immediately contiguous into close touch, and the benefits accruing therefrom are far-reaching.

Located as the city is, on the west bank of the imperial Penobscot, at its junction with the less pretentious Kenduskeag, the business is largely in the valley, while the surrounding heights afford picturesque sites for residences. The diversified aspect is heightened by the

wealth of trees along the residential streets, and few localities are to be found with greater scenic attractions. From the highlands overlooking the city the view is particularly fine, the mountains which fill the eastern horizon making a fitting background to the picture. The Kenduskeag has, through much of its course, very precipitous banks, a notable illustration being the historic Lover's Leap, a mile above the city; and along this picturesque stream are innumerable gems of scenic beauty.

Bangor enjoys the unique distinction of being the only place of its size on the globe where salmon fly-fishing can be successfully practised within the city's limits, and in one season a Bangor lumber manufacturer brought to the gaff and successfully landed twenty-seven salmon, aggregating 500 pounds in weight. The Bangor salmon pool, whence are taken all the salmon caught with a fly on the Penobscot, is situated about a mile above the city and just below the falls that span the river at the Bangor waterworks dam.

Bangor is the home of many sportsmen and is the headquarters in this section for sportsmen's supplies of all descriptions. Nearly all the parties of sportsmen who in the season visit the great wilderness of northern and eastern Maine make this their rendezvous and procure their outfits here. Moose and deer are multiplying rapidly as the result of wise game laws, and Maine is truly the sportsmen's paradise. The records kept by the wardens at Bangor show that during the fall months of 1903 there were shipped to and through the city from the Maine game regions 4,679 deer, 217 moose and 26 bears, the biggest shipment in a single day having been 202 deer and 14 moose.

Population.— In the year 1800 the population of Bangor was 277. From 1830 to 1834 Bangor expanded rapidly and when in the latter year a city charter was adopted the population was about 8,000. The census for 1900 gave Bangor a population of 21,850; the population in 1904 is about 25,000, and with the towns immediately environing, including the city of Brewer across the river, about 40,000.

EDWARD M. BLANDING,
Secretary Bangor Board of Trade.

Bangor, North Wales, an episcopal city and parliamentary borough, in Carnarvonshire, near the northern entrance of the Menai Strait. It consists chiefly of one principal street about a mile in length, nestling i na narrow valley, but there is also a higher and more modern quarter called Upper Bangor, overlooking the strait. The principal public buildings are the cathedral, the bishop's palace, deanery house, University College of North Wales, training college for teachers, etc. Bangor is the oldest bishopric of Wales, having been founded by Saint Deiniol in 550 A.D. He built a cathedral, which the Saxons demolished in 1071, and the new edifice, completed in 1102, was destroyed by fire in 1402. The present structure was in building in 1496–1532; it is of cruciform design, 214 by 60 feet, and has a tower 60 feet in height. Modern improvements have been freely introduced. There are plants for gas and electric lighting, and a free public library. The municipality was incorporated in 1883. The chief local trade is through the Penrhyn slate quarries, in which 3,000 wage-earners are employed. The annual fairs are thronged with buyers and sellers. The fact that the harbor is not suited to large vessels makes the trade by sea of small proportions. Pop. (1901) 11,500.

Bangor, Pa., a borough of Northampton County, 15 miles north of Easton; on the Bangor and Portland and New Jersey Central railways. There are numerous slate-quarries, and the products of the slate-mills, etc., find an extensive market. Pop. (1890) 2,509; (1900) 4,106.

Bangor Theological Seminary (Congregational). It sprang from the Society for Promoting Theological Education, organized in 1810, and chartered in 1812 (for the need at this time see ANDOVER THEOLOGICAL SEMINARY). The seminary was chartered by the legislature of Massachusetts (of which Maine was then a part) February 1814; was opened at Hampden, Me., October 1816; but in 1819 was removed to Bangor and graduated its first class 2 Aug. 1820. In that year the province of Maine was separated from Massachusetts; and the Seminary was conducted as a means for supplying the need in Maine for pastors and teachers. It was at first conducted on the English plan, but a few years later remodeled its courses to suit American needs. Organized to supply the churches of Maine with educated pastors, it has furnished over half their number ever since and does so still. Up to 1903 it had graduated 808 students and given partial course to 255 others. It has endowments which furnish aid to all needy students, and a library of 23,500 volumes; and in 1903 had six professors and 23 students. The course is one of three years, and the Seminary is open to Christians of every denomination. There is an endowment of $10,000 for the Bond lectureship, which is not limited to the subjects common to such lectureships, but includes also instruction in scientific directions. In recognition of the close connection between the Seminary and the Maine churches, the Seminary trustees, in 1827, invited the general conference of the Congregational Churches to send yearly a committee to the institution, and a board of visitors has since been annually appointed by the State conference.

Bango'rian Controversy, a controversy stirred up by a sermon preached before George I. in 1717, by Dr. Hoadly, bishop of Bangor, from the text "My kingdom is not of this world,"— in which the bishop contended in the most pronounced manner for the spiritual nature of Christ's kingdom. The controversy was carried on with great heat for many years, and resulted in an enormous collection of pamphlets. See HOADLY, BENJAMIN.

Bangs, Heman, Methodist Episcopal clergyman: b. Fairfield, Conn., April 1790; d. New Haven, Conn., 2 Nov. 1869. He became a member of the New York Annual Conference in 1815; preached in pulpits in New York and Connecticut; was one of the founders of Wesleyan University, Middletown, Conn., and one of the most effective preachers in his Church.

Bangs, Isaac Sparrow, American soldier: b. Canaan, Me., 17 March 1831; d. 1903. He entered the Union service 9 Aug. 1862; became

captain in the 20th Maine infantry, August 1862; lieutenant-colonel of colored troops, February 1863; colonel of the 10th U. S. colored heavy artillery, November 1863, until honorably discharged 19 July 1864. He took part in the Maryland campaign of September and October 1862, and was present at the battles of Antietam, Shepardstown Ford, and Fredericksburg; was with the expedition to Ellis and Richard's fords, and served through Burnside's second campaign. Later he was at the siege of Port Hudson, La., and commanded the defense of New Orleans. For his meritorious services he was brevetted brigadier-general of volunteers, 13 March 1865.

Bangs, John Kendrick, American humorist and editor: b. Yonkers, N. Y., 27 May 1862. He was one of the founders of 'Life,' and has long been famed for his light verse and humorous stories, among which may be mentioned 'Coffee and Repartee' (1886); 'New Waggings of Old Tales,' with F. D. Sherman (1887); 'The Idiot' (1895); 'Mr. Bonaparte of Corsica' (1895); 'Water Ghost, and Other Stories,' 'The Mantel-Piece Minstrels,' 'The Bicyclers and Other Farces,' 'A Houseboat on the Styx,' and 'A Rebellious Heroine' (1896); 'The Pursuit of the Houseboat' (1897); 'Enchanted Typewriter' (1899); and 'Uncle Sam, Trustee' (1902). He became editor of 'Harper's Weekly' in 1900, of the 'Metropolitan Magazine' in 1903, and of 'Puck' in 1904.

Bangs, Lemuel Bolton, American physician: b. New York, 9 Aug. 1842. He was graduated at the College of Physicians and Surgeons in 1872; was professor of genito-urinary diseases in the Post-Graduate Medical School and Hospital of New York, and later at Bellevue Hospital Medical College; and was consulting surgeon to a number of hospitals in New York. He was president of the American Association of Genito-Urinary Surgeons (1895), and the editor of the 'American Text-Book of Genito-Urinary Diseases,' etc.

Bangs, Nathan, clergyman and author: b. Stratford, Conn., 2 May 1778; d. New York, 3 May 1862. He entered the Methodist ministry in 1801. In 1820 he became head of the Methodist Book Concern, which he reorganized thoroughly, paying off its debts, extending its business, and putting it on a paying basis. He was also charged with the censorship of all its publications. He edited the 'Christian Advocate' and the 'Methodist Magazine'; was a founder and secretary of the Methodist Missionary Society; president of Wesleyan University, Middletown, Conn., in 1841; and in pastoral work from 1842 until his retirement in 1852. His chief work was 'A History of the Methodist Episcopal Church, 1776–1840' (4 vols. 1839–42); others are: 'Errors of Hopkinsianism' (1815); 'Predestination Examined' (1817); 'Original Church of Christ' (1836); 'State and Responsibilities of the Methodist Episcopal Church' (1850). Compare his life by A. Stevens (1863).

Bangue, or **Bang,** a drink much used throughout the East as a means of intoxication, prepared from the dried leaves of the Indian hemp, which are also called by this name. See HASHISH.

Bangued, băn-gād', Philippines, the capital of the province of Abra, Luzon, 236 miles north of Manila. Pop. (1898) 13,417.

Bangweolo, băng'wē-ō'lō (also called BEMBA), a great Central African lake, discovered by Livingstone in 1868, which is 150 miles long by 75 wide, and 3,700 feet above the sea. The Chambeze, which flows into it, and the Luapula, which issues from it, constitute the head-stream of the Kongo. The shores are flat, and parts of the lake are mere marsh. In the northwestern part are four large islands inhabited by the Mboghwa, a race of fishermen and herdsmen. On its southern shore Livingstone died.

Ban'ian, or **Ban'yan** (from Sanskrit *banij*, a merchant), the name commonly given by Europeans to Hindu merchants, brokers, etc., in Bengal and western Hindustan. They are often men of great wealth, and carry on most extensive dealings, their operations extending as far as the borders of the Russian and Chinese territories, the Persian Gulf, and Eastern Africa. They are great travelers, and have countinghouses in almost every trading town of importance in Asia. English sailors call *banian days* those days on which they have no flesh meat. Probably the name has a reference to the habits of this class; because, before people were acquainted with the abstinence of all the Hindus, it was thought to be confined to the Banians.

Banian Tree. See BANYAN.

Banim, bā'nĭm, John, Irish writer: b. 1800; d. 1842. He early exhibited a taste for literature, and before his 20th year wrote a play called 'Damon and Pythias,' which was afterward performed at Drury Lane. His fame rests on his novels, particularly the 'O'Hara Tales,' in which Irish life in all its features is admirably portrayed.

Banim, Michael, Irish novelist: b. Kilkenny, 5 Aug. 1796; d. Booterstown, 30 Aug. 1874. He claimed to have written 13 out of the 24 books of fiction confusedly associated with the names of John and Michael Banim, and called himself the author of 'Crohoore of the Bill Hook,' one of the most popular of the 'O'Hara Tales'; 'The Ghost Hunter' (1833); 'Father Connell' (1842), and 'The Town of the Cascades' (2 vols., 1864).

Ban'ishment (the act of putting under ban, proclamation, as an outlaw), a technical term in Scotch criminal law for the punishment of sending out of the country under penalties against return. This punishment was formerly much used in various forms,— for example, banishment to the plantations or colonies; to England (even after the Union); from a particular county in Scotland, etc. Sometimes capital punishment was commuted to banishment for service in a foreign war. The old Scotch doom of deportation was gradually merged in transportation under various British statutes. At present, banishment is still the statutory sentence in cases of celebrating clandestine marriages.

«Banishment is sometimes used in the sense of expulsion or deportation by the political authority on the ground of expediency, as well as in the sense of transportation or exile by way of punishment for crime.» 3 Am. & Eng. Enc. Law (2d Ed.) 770. The United States

supreme court decided in the case of Fong Yue Ting *v.* United States, 149 U. S. 698, that the right to exclude or to compel aliens, or any class of aliens, absolutely or upon certain conditions, in war or in peace, is an inherent and inalienable right of every sovereign and independent nation. The idea of banishment occurs in the ostracism and petalism of Greece, and the relegation, exile, and deportation of Rome. It was generally accompanied by forfeiture of civil rights. In England, voluntary banishment was called abjuration.

Ban'ister, John, Anglo-American scientist: b. England; d. 1692. He settled in the West Indies, and later in Virginia, in the vicinity of Jamesburg, where he devoted himself to the study of botany. He was a contributor of a catalogue of Virginia plants to Ray's 'History of Plants,' in 1660. The genus *Banisteria* was named in his honor. His publications include 'Observations on the Natural Productions of Jamaica'; 'The Insects of Virginia'; 'Curiosities in Virginia,' etc.

Banister, John, son of the preceding: b. Virginia; d. 1787. He was educated in England and studied law there; became colonel in the Virginia militia; was a member of the Virginia Assembly, and prominent in the patriotic conventions of the Revolutionary period; was a representative from Virginia in the Continental Congress in 1778–9, and one of the signers of the Articles of Confederation.

Banjarmassin, bän-yärmäs'-sẹn, Borneo, a town near the southeastern angle of the island, under the government of the Dutch, on an arm of the Banjar, about 14 miles above its mouth. Owing to the marshy ground and frequent inundations of the river the houses are built on piles, and many of them on rafts, the front next the river being used as a shop or stall on which wares are exposed for sale. On market days the water is covered with skiffs, having a single individual in each, moving about selling vegetables, etc. The people are continually on the river, all necessaries being purchased at these floating markets, and all business being done on the water. In every respect it is a floating town, possessing neither carriages nor horses; the only animals kept being pigs, goats, ducks, geese, and fowls. The houses of the European functionaries, the government buildings, and the fort, are built partly of stone and partly of wood. The fort Tatas is surrounded with palisades, and contains the resident's house, the magazines, and barracks. Exports are pepper, benzoin, bezoar, ratans, dragon's blood, birds' nests, iron, and straw mats very artistically made; and imports rice, salt, sugar, opium, coral, Chinese poreclain, silk, cutlery, gunpowder, etc. Pop. about 35,000.

Ban'jo (a negro corruption of *bandore,* Italian, *pandora,* from Greek *pandoura,* a three-stringed instrument), the favorite musical instrument of the negroes of the southern States, and now widely popular elsewhere. It is five-stringed, has a body like a tambourine, and a neck like a guitar, and is played by stopping the strings with the fingers of the left hand and twitching or striking them with the fingers of the right. The upper or octave string, however, is never stopped.

Bank, primarily an establishment for the deposit, custody and repayment on demand, of money; and obtaining the bulk of its profits from the investment of sums thus derived and not in immediate demand. The term is a derivative of the banco or bench of the early Italian money dealers, being analogous in origin to the terms *trapezitai* (*trapeza,* a bench or table) applied to the ancient Greek money-changers, and *mensarii* (*mensa,* a table) applied to the public bankers of Rome. See BANKS AND BANKING.

Bank Bills, or **Notes,** promissory notes issued by a bank or banker and representing their face value in specie. In the production of bank notes the principal purpose is to render their forgery impossible, or at least easy of detection. This is sought to be effected by peculiarity of paper, design, and printing. Bank of England notes are printed in one of the blackest and most indelible of inks, on paper expressly made for the purpose by one firm only. It is a hand-made paper, remarkable for strength, lightness, and difficulty of imitation, and its peculiar watermark constitutes one of the chief safeguards against forgery. No Bank of England notes are issued twice, so that this mark is rarely indistinct and the paper does not lose its peculiar crispness. Some years ago a self-registering machine was invented for impressing on each note a distinctive mark known only to the bank authorities. Owing to some of the notes of the Scotch banks, printed simply in black ink, having been successfully forged by photography, those issued by them have since 1858 been printed in colored inks, at least two colors being used for each note.

Since 1855 the notes of the Bank of England have been all produced by surface printing from an electrotype. The number of notes produced and issued by this bank sometimes amounts to 300,000 per week. There are 70 or 80 kinds of Bank of England notes, differing in their denominations or values, but similar in the mode of printing.

In the United States the bank notes at present in circulation are manufactured by the Government Bureau of Engraving and Printing, the paper being made by a private concern under a patented process, the chief ingredients being a mixture of linen and cotton fibre, into which are introduced threads of silk so arranged as to be perceptible after the notes are printed. This style of paper is furnished only to the government. The highest skill is exercised in engraving the plates, nearly all parts of them being executed by the geometrical lathe and the ruling-machine the work of which it is impossible to imitate successfully by hand. The printing of the notes is done in colored inks of the best quality, sometimes as many as four shades being used. The great expense of the machines used in the engraving, and the superior quality of the work generally, renders successful counterfeiting almost impossible. The notes, when badly worn, are returned to the United States Treasury, and other notes are issued in their stead. See MONEY, PAPER.

Bank Holidays, days during which banks are legally closed. In the United States they are: 1 January, or New Year's Day, a legal or bank holiday in all the States except Arkansas, Delaware, Georgia, Kentucky, Maine, Massa-

chusetts, New Hampshire, Rhode Island, and North and South Carolina. 4 July, Independence Day, and 25 December, Christmas Day, are bank holidays in all the States and Territories of the Union. Thanksgiving Day and public fast days appointed by the President of the United States are also legal, or bank, holidays. 12 February, the anniversary of the birth of Abraham Lincoln, is a legal holiday in nine States. 22 February, the anniversary of the birth of Washington, is a legal holiday in all the States save Arkansas, Iowa, and Mississippi. The first Monday in September, Labor Day, is a holiday in nearly all the States. 8 January, anniversary of the battle of New Orleans, and Firemen's Day, 4 March, are legal holidays in Louisiana. Good Friday is a legal holiday in Florida, Louisiana, Minnesota, and Pennsylvania; and Shrove Tuesday in Louisiana and Alabama. Decoration Day (North) and Memorial Day (South) is observed in the several States.

In England and Ireland the bank holidays are: (1) Easter Monday; (2) the Monday in Whitsun week, generally called Whit Monday; (3) the first Monday in August; (4) 26 December, popularly called Boxing Day. In Scotland: (1) New Year's Day; (2) the first Monday in May; (3) the first Monday in August; (4) Christmas Day.

When one of these holidays falls on Sunday it is observed on the following day, and a note or check becoming due on a holiday or a Sunday is payable on the first business day following.

Bank-swallow, a small swallow, familiar not only in all parts of America, but in most other countries, for its habit of breeding in colonies in holes in sand-banks. It is sooty black above, and white on the under surface of the body, with a dusky band across the breast. This swallow comes from its winter home in the tropics, among the earliest birds of spring, and spreads northward even to the borders of the Arctic Ocean. Many, however, remain within the United States, where companies of them seek the banks of streams or exposed cliffs of sand, and bore in close proximity a great number of tunnels, which may be seven or eight feet deep. The bill and feet are both exceedingly weak, yet with these feeble tools each pair, working alternately and with great diligence, complete their excavation in a surprisingly short time. The same bank will be occupied year after year. The inner extremity of the tunnel is furnished with a nest of dry grass and feathers, and there are laid in June four or five pure white eggs. The tunnels are used as roosting places at night by both sexes, and when the young are hatched they will scramble to the mouth of the burrow and may be seen sitting there some days before they obtain strength and courage to launch forth upon their wings. These swallows, like others, feed entirely upon small insects caught in the air, and the sight of a crowd of them darting about the neighborhood of their homes, with a constant twittering, is one of the most familiar and pleasing sights of our country districts. The English sparrows trouble them greatly by seizing upon their burrows and dragging out the furniture; and snakes and mice sometimes enter the holes, but against most enemies these swallows are well protected. Our common species (*Clivicola riparia*) is also numerous throughout Europe and Asia. Very similar species inhabit the Oriental region and Africa. These birds are well described in all standard works of ornithology, and some special information may be obtained in the 'Monograph of the Hirundinidæ' by Sharpe and Wyatt (1885–94); and in 'Bird Watching,' by Edmund Selous (1901). See SWALLOW.

Banking Institutions, the Examination of. Since the beginning of the Civil War, corporations have materially multiplied in number in the United States. As their scope has broadened and their responsibilities have grown with their increase, it has been found necessary to the inspiring of public confidence, to the protection of vested interests, and the prevention of abuse, to prescribe certain limitations beyond which they may not go. On the other hand, extraordinary powers have been shown to be absolutely necessary to the successful prosecution of enterprises which must otherwise be undertaken by the State or municipality or else remain unaccomplished, not only to the detriment of the public interests but to the impoverishment of a whole country. The wisdom of such legislation, permissive yet restrictive, which has brought the great corporations of the day into being has been fully justified by experience. This is especially true of the great financial institutions which supply the funds for gigantic undertakings. In fact, in this connection we find that of all the large corporations those pertaining to banking are the most important, the most necessary of all. These it is that make great nations and render possible the living in comfort of millions within a prescribed area; for it is the financial institutions that supply the means for building railways, installing the prominent manufacturing industries, rebuilding cities — as the city of New York is now being rebuilt — and even furnishing the means, at a time of national peril, of successfully maintaining a war of defense against aggression and aggrandizement. Let us glance at a few of the benefits which our national and State banks and trust companies and banks for savings confer.

Benefits of Banking Institutions.— These institutions afford a permanently safe place where the individual may deposit his moneys. And this is much more of a privilege than may appear on the surface. For not only is the secure place of deposit supplied, which otherwise would be wanting, but the bank practically insures the safety of the funds committed to it: if in any way loss is sustained by robbery or fire or by some other cause, the bank is bound to make good the loss, and this regardless of the fact that the depositor may not be a profitable customer, as many dealers are not. In fact, the number of depositors who simply use a bank as a convenience, whose deposits are not large and whose multiplicity of small checks

are a trouble, as they are the despair of the individual bookkeeper, is legion. Nevertheless the bank takes such accounts, holds the money subject to innumerable little drafts which are made good by new deposits equally numerous and small; and thus the active little account is maintained from year to year, often only a source of trouble and expense to the bank, which actually receives no adequate return for its services as warden and agent. It is to be noted, too, that in this country the services rendered the individual by the banks differ greatly from those afforded by like corporations in some other countries, notably in France. To cite one instance: In that country every note when due must be paid to the bank officer in hard cash; a check on that or some other bank, duly certified, would not be received. In fact, the bank's messenger visits the payer of the note and demands the payments of the exact amount in cash, or protest and legal proceedings follow.

Relation of Banks to the Community.— But leaving this phase of the subject, a glance will show how vital is the relation of a bank to the community doing business with it. In a word, it may be said to receive all the money that comes to that community and to disburse it as desired by the customer. Not only so, but when he cannot command the money required to transact his business, the bank may supply the desired amount. Thus it is, estates are cared for, income in the shape of interest is paid, vast sums are committed to its keeping, while by its loans made at times of emergency the bank enables the business of the community to be transacted; and this principle extended stands for the business of the world. It is easy to see that a misfortune to such an institution means a calamity to a community, and a series of them means panic, with its consequences of impoverishment and distress, and sometimes ruin to countless thousands. How disaster in this direction has been wrought in the past those familiar with the history of banking in the earlier days, when banks were not subject to the restrictions of the present time, and when the failure of a bank often meant irreparable loss to innocent holders of their circulating notes, are fully aware. But when we go farther and take the most superficial glance at the great industries of the country, we obtain some conception of what banks and banking mean. Is it too much to say that without credit and banking facilities the unparalelled facilities of our gigantic railway systems, stretching from ocean to ocean and conveying the enormous crops of the country by which we are enabled to feed the world, would be in vain? In the last analysis we shall find that it is not car wheels, but it is money, that moves the great harvests of a continent — as for that matter, of the world. And the money would be lacking but for the banks; these, and not steam or electricity, stand between the nations and starvation.

Safeguarding Depositors.— It would seem that under the circumstances no argument was required to establish not only the necessity for adequate safeguards in the shape of stringent statutes, but that measures should be provided to insure strict conformity on the part of the bank officers and directors to the requirements of the banking laws, thus safeguarding the depositor against abuse of privilege or criminal carelessness. The attainment of this object is sought by the provision in national and State legislation, as the case may be, requiring official examination and the publishing of a statement of a bank's condition from time to time as the authorities may deem expedient. There is but one proper bank supervision, and this includes mental alertness to discover the very best methods for despatching business with celerity, for insuring correctness, for guarding most effectually against errors, and to render tampering with the books most difficult and detection most easy. It means, too, economy in the use of time — the article which so many squander lavishly as if, like the waters that pass out from between the mute lion lips of the Nile fountains, it was to flow on forever. Supervision means, also, such oversight as makes the manager thoroughly familiar with the business of the bank, so that he can upon occasion command the fullest information regarding a new department of the business at a moment's notice. The years of a banker's work in the discharge of his heavy responsibilities are not many at the most. From the time he assumes the direction of the affairs of a bank to the time when his own ledger must be closed, a very few decades intervene. When that time has come and he either passes from all work or puts down his pen and vacates his chair for a younger man, it becomes evident that the supervising banker — be he president, or cashier — whoever he may be and whatever his official designation — should be able to hand over to his successor not only the assets of the bank unimpaired, but an intelligible working system such as will enable the new manager to familiarize himself with the details of the business and discover the exact situation with the least delay. But this can only be accomplished by the inauguration of a system as nearly perfect as may be, which, with its comprehensive method of safeguarding checks, will require of him less devotion to such details as it is the province of his subordinates to supervise. That is to say, the more perfect the system in practice the more time will the manager have for the exercise of his judgment upon the most important questions coming before him. It is here that the test of the most efficient bank official lies. Take, for an illustration, the work of supervising the loans made on real estate.

Expert Examinations.— It has been held, and is indeed held by many knowing no other method, that to ascertain the value of properties submitted as collateral for loans recourse must be had to some qualified expert, generally some one engaged in buying and selling real estate. The judgment of such an authority has been, and is, accepted as conclusive on the security offered, and determinative as to whether the report shall be favorable or adverse to the loan. But here the question arises, Who shall guarantee the expert? — for experience has too often shown that his judgment may fail, or it may be discovered that the expert was consciously or unconsciously interested in advising the loan: the applicant may have been a friend of his, or — and such cases have been — it may be his own device for getting a loan by applying through

the concealed interest of another party. But suppose a more excellent way is to be found by which the bank can be rendered reasonably certain as to the value of the property, that a clear title can be given, that it has real existence as described, both as to environment and prospective value; if he be a wise banker, will he not take advantage of that safer and saner method? And let us suppose, further, that in this way our banker is kept informed regarding specific localities, as to whether they are advancing or retrograding in value, whether the interest is kept up — is it not clear that a banker who has such expert advice is not only freed from duties that would otherwise needlessly weigh upon him, but that his services are to just this extent made more valuable in that with less time expended in searching for details and technicalities he has more time to devote to other important duties? Needless to say, I am not pleading for a title guarantee company or other corporation; I only say this — that where the services of these or kindred institutions are warranted by the business of the bank — and it must be small institutions where the volume of business does not warrant them — such facilities carrying guarantee of perfect safety should be utilized by the prudent banker. Illustrations of the principle that the more responsible officer should not be troubled with detail that can be as well looked after by capable subordinates are supplied at every turn. They obtain recognition in the management of our great industrial corporations where reports of details are placed before responsible heads and action based on them is taken accordingly. In fact the principle finds expression in every phase of activity, being adopted by the captains of industry as well as by the captains of great armies. Assuredly, great as Napoleon was, and past master in the art of war, had he attempted to perform the duties of subsistence commissary, quartermaster, adjutant, and inspector, the story of Wagram would in all probability still be unwritten, and the history of Austerlitz would only be that of an inconsequential village in the outskirts of Vienna.

Systematic Examinations Essential.— But be supervision ever so thorough, it cannot serve its proper purpose without a system of right examination — rather of examinations. Unceasing watchfulness can only be maintained through proper investigations, not only to detect fraud but errors of judgment. The usual examinations of books are of but two kinds, those of the directors, and those of the official examiners of the general or State government, as the case may be. Of these two methods, that of the directors, when rightly conducted, is most important, and for the obvious reason that the directors are better informed as to the value of paper and local securities than the official bank examiner, as a rule, can be. That the examinations made by directors are too often superficial and perfunctory, goes without saying. Were it otherwise we should hardly have the record of the year last past, which showed 26 national banks placed in charge of receivers. Six, however, have resumed business. Eight of these failures were due to fraudulent management, or to dishonesty of cashiers. Besides this, during the year ending June 1904, 50 private banks, 37 state banks, 8 trust companies, and 7 savings institutions became insolvent. Of course, in the examinations by the directors the revision of loans is most important, enabling the board, as it does, when conducted in a business spirit, to detect improper advances on an insufficient collateral or inadequate endorsement. It is here the examination should be most thorough, so that the presence of "weak" paper, which often becomes such after the loan has been made, may be discovered and remedied. Obviously in such an examination every piece of paper must be gone over as to time of maturity and collateral, which latter should invariably be produced. Collaterals should all be carefully examined with reference to their proper assignments to the bank, so that there may be no question about its ability to exercise a legal ownership, if necessary. The ticklers, the discount book, and all books pertaining to this most important branch of bank, should be carefully investigated, and the precise facts ascertained. The liabilities of the bank, its deposits and cash on hand, the character of the depositors and borrowers, the condition of the individual and general ledgers, the bad debts of the bank, including especially notes past due, over-drafts when permitted — all these and more should be investigated by the board, and this without bias to any officer or employe of the bank; all of them who discharge their duties faithfully will be glad of an examination which will result in enhancing the appreciation and increasing the confidence of the board as to the value of their services.

To insure the correctness of balances on the individual ledgers it would be well to render a monthly statement to depositors having active accounts, and to others at short intervals. A reconcilement blank, stating that the balance is correct, should accompany the same, to be signed by the depositor, and an envelope addressed to the cashier. If there are errors, the depositor may note them, to the end that they may receive official attention immediately; these reconcilements to be filed by the auditor and checked back by the examining committee.

Surplus Nominal and Real.— In some instances it would be advisable for the directors, when making an examination, to employ a trustworthy expert accountant to aid them in their investigations, because such an expert may be able to make a more complete analysis of the condition of the bank than can the directors. Here I venture, in the interests of justice to all, to express the conviction that while banks may continue to fail, shortly after they have secured a certificate of soundness from the national or State bank examiner — as they have failed in the past — no such failure should take place following a like verdict of a board of directors of a bank, though there have been such cases. The official examiner of the national or State government may not be presumed to know the standing of many of the promisors or endorsers of notes. It may be impossible for him to detect worthless paper, though it is supposed to represent thousands upon thousands in value. But no such plea can be accepted for the directors of a bank, some, if not all, of whom should have knowledge of the value of the paper upon which they lend their depositors' money. And what are the directors but trustees of the moneys

of others, committed to them in perfect confidence, and to whom no language can too severely be applied, who fail to direct? Here it seems proper to emphasize a practice which is becoming far too common in the management of banking institutions, namely, the practice of carrying on the general ledger a large surplus fund, or undivided profits, through the failure to charge off bad paper which is known to be such. This is a matter to which, in their examination, directors should give their attention, that their bank statement may represent the exact condition of the institution; just such a statement, in fact, as every right-minded director would furnish were the bank his own property. But let me be just to the directors, many of whom are prominent business men, some of them directors in several other institutions and otherwise engaged in business occupations which take all their time, and which make it impossible always for the director to direct and examine, as he would be glad to do. This fact has obtained recognition among leading bankers, who have inaugurated another system of examination, namely, the practice of having the books of the bank examined as often as may be deemed expedient by a committee appointed by the president from the competent clerks, including a chairman of considerable experience. The committee being notified assemble immediately. Without a moment's warning all the affairs of the bank are put in their hands. They count the cash on hand, examine balances, count all securities, examine and compare the sum total of all discounted bills and their collaterals, verify all accounts in the ledgers — in short, they rigidly scrutinize the condition of the bank. No one — no officer even — is allowed to make any transaction without the knowledge of the committee, who take due account of it. Where, as in the large cities, branch banks exist, the affairs of each branch are also examined in the same manner and at the same moment, that there may be no collusion by shifting of balances, borrowing money or securities to make good a deficiency.

How Some Banks Examine Themselves.— The following from a circular letter, convening a committee of examination, will give some idea of the character of the work performed. The first line of the instructions to the committee may read as follows:

On presentation of this order you will at once take charge of the bank, and will not allow any officer or clerk to do anything without your knowledge.

Then follow specific instructions to the committee: First, count the cash in detail. Examine the cash items, and all items composing exchanges, and see if any are irregular, and make full returns to the president. Test all discounted bills, their endorsements and collaterals, and prove the amounts and accompanying securities. Check up all the loans. Verify all extensions and balances of ledgers. Prove all certificates of deposit and certified checks as well as all outstanding vouchers. Prove the cashier's account; make a record of all outstanding vouchers and see that all checks drawn by the bank have two signatures. Verify the expense account. Ascertain whether all charges are initialed by an officer. Prove the tellers' difference and submit all items to the president. List all amounts due from banks and verify them, noting any irregularity. Report on amount due from each concern. Scrutinize and report upon clearing house accounts and margin accounts of the Consolidated, Produce, and Cotton exchanges. List all dividend checks unpaid. Check off all stocks, bonds, and mortgages. Describe all overdrafts, and see whether the books are properly kept. Report all suspended debts and balances due. Check off, a month back, the discount book and see if all amounts are duly entered. Examine exchange account: see if the entries appear suspiciously low and if there are any debits. Investigate interest account; see if all charges are initialed by an officer. All insurance policies and bonds should be scrutinized and a complete record made of the same. Report on all differences called for on general ledger, and whether they are all known to the officers. State at length your views as to the condition of the bank; report any departure from the method of our system as you understand it. Report any suggestions that may occur in connection with the method of bookkeeping looking towards their improvement. Finally state errors made in the methods pursued in the handling of bills discounted, loans, or any other detail of the business.

In view of the facts which have been given concerning these examinations made by bank clerks themselves as to the condition of their own institution, is it not true that while a great deal of importance is attached, and rightly so, to the report of the official bank examiner, it must be obvious that the examination by the committee as stated is exceedingly desirable. The fact that the bank's investigating committee enter into possession and assume entire control of the bank's affairs, which they retain without interference or interruption until they have thoroughly satisfied themselves that the books of the bank are correct and its affairs precisely as represented, affords the best possible guarantee against fraud and clerical errors. It would seem wise that all banks should cause such examinations to be held; where this is not expedient the same methods should be pursued by the directors. If any illustration were desired showing the necessity for rigid supervision and thorough examination it may be found in the astonishing story which appeared in the public journals in December 1904. The fact is disclosed that a woman not engaged in business, and not known to possess tangible assets, was able to obtain from at least one bank, with a reputation for conservatism, loans of four times the capital stock of the institution.

It is a good plan, when an investigation is being made by national or State bank examiners, to appoint a committee of the clerks to co-operate with such officials for the purpose of verifying the investigation.

A theft which had wide newspaper publicity, both because of the very large sum stolen and the prominence of the bank in the city of New York, was where a receiving teller was found to be a thief, although the directors had absolute confidence in his integrity. He used part of the receipts of one day to cover the shortage of the day preceding.

In one bank two individual bookkeepers were

in conspiracy with a dealer. They allowed the depositors to draw out more money than they had deposited by covering up the defalcations by false entries.

The officer in charge of the exchange department in one case entered drafts issued by him for a less amount than the face. To illustrate: A $5,000 draft was entered by him as $1,000, and, as he had charge of the "reconcilement," the difference was transferred from one account to another. If a ledger is manipulated, or a certificate of deposit register falsified, it is difficult to discover the fraud.

It is true that in the larger cities the national bank examiners receive pay whereby, perhaps, they may receive sufficient to enable them to make a proper examination, but the law is such that it is alleged a premium is placed upon incomplete work by the provision contained in the statute for the pay of examiners outside of the central reserve cities. There are, at the present time, only 78 examiners to investigate 5,536 national banks, and but a short time can be given by the examiner to his work.

It is a wise proceeding to compel all employes to take a vacation without notice each year, so that others may become acquainted with their duties. In this way, sometimes, defalcations have been discovered.

In my experience, there has been found no more satisfactory preventive against fraud than the changing of employes, without previous notice, for a short time, from one department to another, at least once a year. A constant inquiry should be made as to the conduct and habits of all persons employed by the bank. Such inquiry may not make a weak man strong, but good resolutions may be strengthened by the knowledge that the penalty for wrongdoing will be surely and promptly inflicted.

It is only a truism to say that good bank management and thorough examination are wholly impossible in the absence of a definite system, which enters into every phase of industry. We find it everywhere. The manufacturer who does not know in detail his stock on hand at any time is in as dangerous a position as an engineer without a steam gauge. His steam may be low — the machinery of his business will suddenly stop. His pressure perhaps is high — all his capital tied up in stocks means an explosion — and the receiver gets the pieces.

Necessity of Method.— To a right and safe banking system method is a necessary protection. Unsystematic banking is not only a paradox, it is a contradiction in terms. System economizes time, excites invention, expands energy, concentrates power and accelerates results. Without system, determination weakens, purpose crumbles, failure is sure. Subtract system from banking and chaos is left. In banking there is no middle ground between order and confusion, between cosmos and chaos. System, applied to banking, should make it easy for the manager to have its condition constantly before him. Emphasis has been placed upon the value of examinations conducted by bank clerks. But in view of the close relationship of these institutions to the public welfare, and the further fact that they are virtually the creation of the Federal and State laws, it is evident, not only that banks should be examined by officials of the respective governments, but that the examinations should be of the most searching character. A good bank will court investigation. Whether it is true or not, as a recent writer has said, that "bank examiners are not called upon to play the detectives," it is assuredly true that they should discharge their duties with thoroughness, and with a realizing sense of their duty to the public. So far as practicable they must see to it that collusion at the time of examination, between teller and discount clerk or other officers is made impossible, and that neither cash nor vouchers are made to do double duty in the hands of the dishonest, as has been done. It may not be assumed that either national or State or directors' examinations will form an infallible guarantee against dishonest practices. But what may justly be expected of these examinations, together with such as the bank officials may themselves institute, is that they will reduce losses through error or fraud to a minimum. No known system affords any guarantee of faultless management; but the best system rigidly applied will produce the best results possible; and for this the public have a right to look.

The Pre-eminence of New York.— Some years ago I made the statement that the banking law of the State of New York not only furnished the model for the National Bank Act but that it had affected the management of the Bank of England, so that New York may be said to have furnished banking law for two worlds. Gradually but surely the larger financial institutions of this country, following the law of concentration, are developing in capital and other resources until at a time not distant, unless all signs fail, the Bank of England will yield to this country the possession of the world's greatest financial institutions. And it may not be wholly irrelevant to remark here that the lessons America has taught Great Britain, as certified to by Daniel O'Connell, John Bright, and other British statesmen, are neither few nor unimportant — only to mention the lesson of local self-government as seen in the several States and counties of the Union, the lesson of religious liberty as seen in a nation without a Church, witnessed, too, in free commercial intercourse as exemplified in the freedom of intercourse between the several States and Territories. Can it be doubted that in the management of the great financial institutions this country will exert a more powerful influence upon the other nations of the world than she does even now? When it is stated that enough money lies to-day in the savings banks of the State of New York alone to pay off our entire national debt on demand, and leave a substantial balance, is it not made clear that if we are a spending nation we are also a saving people? And let it be said that should the worst ever come to this country through the horrors of war, it may not for a moment be doubted that the financial resources of America will serve her even more effectively than the Bank of England served Great Britain through the Napoleonic wars, when she was obliged to send large sums of gold and silver out of the country.

When we regard our financial resources in the plentitude of their full significance it scarcely

seems possible to exaggerate the significance or importance of anything and everything that bears upon our financial institutions. And what can be of greater importance than the thorough, systematic, exhaustive and regular examination of our great financial institutions — our national and State banks, trust companies and institutions for savings whose capital and deposits are expressed by billions? What can be more essential to the welfare of a community of breadwinners and dependents upon them than the assurance that those institutions, with which are lodged the means for conducting the vast enterprises of the country and the earnings which have been won by hard labor, are conducted in an honest, businesslike way, prepared to meet the demands that may at any time be made upon them? And the key to such a situation — what is it but such thorough supervision, with rigid examinations, as shall inspire confidence and dissipate alarm in hours of financial stringency and tendency to distrust? A mercantile house may fall, and the adverse results may be partial and remediable; but when a great banking institution goes down, credit goes, fortunes disappear, the poor are left helpless, and the tale of suffering is long and grievous.

No banking institution to-day is of the right kind which is conducted as such institutions were 50 years ago. In like manner we may believe that in future years new methods, new safeguards, enforced by an impartial, effective system of promotion of the personnel, will give increased efficiency in bank management, resulting in a greater volume of business, fewer bank failures, and heavier balances on the right side of the ledger.

No institution can run itself — except to ruin — least of all a bank. Eternal vigilance is no less the price of liberty than of safe banking; and only those institutions can gain and deserve the public confidence and justify the powers conferred upon them which are managed under a supervision that is searching and thorough, including examinations which are rigid and relentless.

WILLIS S. PAINE, LL.D.,
Ex-Superintendent New York State Banking Department, President Consolidated National Bank.

Bank'rupt, a term derived generally from Italian, *banca,* a bench, and Latin, *ruptus,* broken, in allusion to the benches formerly used by the money-lenders in Italy, which were broken in case of their failure. The word in its most general sense signifies an insolvent person, but more strictly an insolvent merchant.

There is perhaps no branch of legislation more difficult, and at the same time more important, than that which defines the relations of debtors and creditors. One of the first objects of all laws, after the protection of the person, is the enforcement of the obligation of contracts, and among all the contracts made in a community those imposing the obligation to pay money constitute the most numerous class. Some of the first questions in legislation are: By what measures shall this obligation be enforced? and by what penalties shall the breach of it be punished? In many communities, especially in the earlier stages of civilization, the breach of such a contract or obligation is regarded as a crime, and the insolvent debtor is treated as a criminal. The ancient laws upon this subject in England so regard the insolvent trader. The early laws of the Romans and Athenians authorized the most rigorous measures for procuring satisfaction of a debt, even permitting the sale of the debtor into slavery for this purpose. The Battas of Sumatra still, it is reported, sell not only the debtor, but also his family for the benefit of the creditor. But as civilization advances the laws put a more mild construction upon the debtor's failure to fulfil his contract, and, with certain qualifications, and under certain restrictions, attribute it to misfortune, and, on giving up his property to be divided among his creditors, discharge him from all further liability.

The power of making bankrupt laws in the United States was, by the Constitution, conferred on Congress, which alone had the power to make a bankrupt law applicable to, and binding upon, all creditors in the United States, and for all descriptions of debts. This power was first exercised by Congress in 1800, by the enactment of a bankrupt law limited to five years, and which expired by its own limitation. This act was modeled upon the English statutes of bankruptcy existing at the time, and, like them, was applicable to no debtors except merchants. Both by the English statutes and the French code, persons capable of becoming bankrupts are such as fall under the general description of merchants, which the French describe as commercants.

A statute of the reign of George III., relating to bankrupts in Scotland, describes a person capable of becoming such to be one who "either for himself, or as an agent for others, seeks his living by buying and selling, or by the workmanship of goods or commodities"; an English statute of the reign of George IV., embodying the previous acts and judicial decisions on this subject, enumerates particularly the descriptions of persons who are to be considered merchants, and capable of becoming bankrupts. See BANKRUPTCY LAWS.

Bank'ruptcy Laws. When a person is unable to pay his debts in full, the law of civilized countries adopts some means of satisfying the creditors, as far as they can be satisfied, out of the debtor's estate, and relieving the debtor himself from pressure which, by his own efforts, he would not be likely to overcome. The debtor having been declared a bankrupt, his property vests in his creditors for the purpose of being divided ratably among them, and consequently he starts anew, entirely relieved from the obligations thus partially satisfied. In general terms this is the process of bankruptcy as observed in modern societies. The law of bankruptcy is, in fact, a modern creation slowly evolved out of the criminal code in answer to the necessities of a widely spread industrial life.

The early law of Rome, while prohibiting contracts of usury, gave the legal creditors the savage remedy of dividing the carcass of their debtor or selling him and his family into slavery. The *Lex Poetelia* (about 326 B.C.) enabled a debtor who could swear to being worth as much as he owed to save his freedom by re-

signing his property; and many years afterward the legislation of Julius Cæsar established the *cessio bonorum* as an available remedy for all honest insolvents. The bankrupt law was slowly developed in England. The first English statute on bankruptcy (34 and 35 Henry VIII., c. 4.) was directed against fraudulent debtors, and gave power to the lord chancellor and other high officers to seize their estates and divide them among their creditors. In England, before 1841, only a tradesman could be a bankrupt. This distinction was then abolished. It was abolished in the United States in 1869. In the United States, Congress alone has power to pass a bankrupt law which shall have authority throughout the country. The several States may enact such statutes when there is no law of Congress in operation. The first general bankrupt act in the United States was passed in 1800 and was repealed in 1803. In 1841 another law was put in operation, with a special view of meeting the urgent needs of debtors who had been ruined by the commercial revulsion of 1837–8, and who could receive no effectual relief from local laws. This act was repealed in 13 months, but in the meantime a large number of cases had been disposed of, amounting to 3,250 in Massachusetts alone. Another bankrupt law was passed which took effect 1 June 1867. It was framed with great care by a committee of the House of Representatives, of which Mr. Jenckes was the chairman and chief working member. Its authors hoped that it would form a permanent addition to the jurisprudence of the country, but it was repealed within a few years.

An act "to establish a uniform system of bankruptcy throughout the United States," was passed by both Houses of the 55th Congress. and by the approval of President McKinley became a law on 1 July 1898. The question had been brought before Congress for several years, the issue not being between the political parties, but on the method of legislation, one side favoring the creditor and the other the debtor class. The Nelson bankruptcy bill, which at the first, or special, session of the 55th Congress, passed the Senate, failed to receive the consent of the House. The new law was a compromise between the Nelson bill, calculated chiefly to benefit debtors, and the Torrey bill, designed to guard the interests of both creditors and debtors. The adoption of the bill which became a law was mainly through the long-continued efforts of Senator Hoar (Rep., Mass.), aided especially by Senator Nelson (Rep., Minn.), and Representative George W. Ray (Rep., N. Y.). A conference between the two Houses was held, which reached an agreement on 15 June, the report being adopted by the House, 28 June, by a vote of 133 to 53; present and not voting, 24. All the votes against the bill came from the South and the far West.

The provisions under which a man can be thrown into bankruptcy against his will are as follows: (1) where a man has disposed of his property with intent to defraud; (2) where he has disposed of his property to one or more creditors to give a preference to them; (3) where he has given a preference through legal proceedings; (4) where a man has made a voluntary assignment for the benefit of his creditors generally; (5) where a man admits in writing that he is a bankrupt. The last two provisions are practically voluntary proceedings. Under the common law a man is considered insolvent when he cannot pay his debts when they are due; under the new law he is deemed insolvent only when his property, fairly valued, is insufficient to pay his debts. Only two offenses are cited under the new law; one when property is hidden away after proceedings in bankruptcy have been begun, and the other when perjury is discovered. Discharges are to be denied in only two cases; one, in which either of the offenses detailed has been committed, and the other, when it is shown that fraudulent books have been kept. The term of imprisonment for either of these offenses is not to exceed two years.

The law provides a complete system throughout the United States, and for its administration by the United States courts in place of the different systems formerly in existence in the various States administered by State courts. In bankruptcy proceedings a bankrupt debtor may turn over all his property to the court, to be administered for the benefit of his creditors, and then get a complete discharge from his debts. A bankrupt may of his own motion offer to surrender his property to the administration of the United States court and ask for his discharge in voluntary bankruptcy, or creditors may apply to the court to compel a bankrupt to turn over his property to be administered under the act for the benefit of the creditors in involuntary bankruptcy. The bankrupt who has turned over all his property and conformed to the provisions of the acts is entitled to a judgment of court discharging him from any future liability to his creditors.

Extended powers are given by the law for the taking possession and the administration of the assets, among others, to allow and disallow all claims against bankrupt estates; appoint receivers and take the necessary measures for the preservation and charge of the property of a bankrupt; to arraign, try, and punish bankrupts, officers, and other persons, and the agents, officers, and members of the board of directors or trustee, or other similar bodies or corporations for violation of the act; to authorize the business of the bankrupt to be conducted for limited periods; to cause the assets to be collected and reduced to money and distributed, and substantially determine all controversies in relation thereto; to enforce obedience to lawful orders by fine or imprisonment; and to extradite bankrupts from one district to another. As all questions, both of law and fact, in relation to the property of the rights of the various parties, must be decided in the bankruptcy proceeding, it is provided that referees be appointed, who are charged with the duty of hearing the allegations and testimony of all parties, and deciding all such questions as may arise. Each case, as it comes up, is assigned to some referee, whose duty it is to adjudicate and pass upon all such questions arising therein in the first instance, the right being reserved to any parties to appeal from the decision of the referee to the United States district court. The duties of the referee are substantially of a judicial character, and he occupies much the position of a judge of primary resort, subject to an appeal to the court, and is required to take the same oath of office as that prescribed for judges of the United States courts.

Provision is made in the act for allowing bankrupts to compromise or settle with their creditors by a proceeding known as composition proceedings, whereby, if a bankrupt and a majority of his creditors agree upon some basis of settlement, the same, if approved by the court, shall become binding upon all creditors. The decision of the question as to the approval of compositions and granting discharges to a bankrupt from his debts is specifically reserved by the act to the judges of the United States courts; but the court, by virtue of its general powers, may refer such matters to the referee to take testimony and report to the court his opinion thereon. The aim of the act has been to make the expense of the proceedings depend largely upon the amount of the property involved, and the compensation of the referee is fixed substantially at one per cent on the amount distributed to the creditors in ordinary cases, where the assets are distributed by the court, and one half of one per cent in composition cases, and the trustees who have charge of the actual management of the bankrupt's property receive as compensation such commissions on accounts paid out by them as dividends as the court may allow, not to exceed, however, three per cent on the first $5,000, two per cent on the second $5,000, and one per cent on all sums in excess of $10,000.

Banks, Mrs. Isabella (VARLEY), English poet and novelist: b. Manchester, England, 25 March 1821; d. London, 5 May 1897. After teaching school for some years in Manchester, she married the journalist, George Linnæus Banks in 1846 and with him published a volume of verse, 'Daisies in the Grass' (1865). Her first novel, 'God's Providence House' (1865), made her widely known, and among other popular novels by her are: 'Stung to the Quick' (1867); 'The Manchester Man' (1872); 'Wooers and Winners' (1880); 'Forbidden to Wed' (1883); 'In His Own Hand' (1885); 'Geoffrey Oliphant's Folly' (1886). She published several volumes of poems also and she and her husband were the authors of many popular songs.

Banks, Sir Joseph, English naturalist: b. London, 4 Jan. 1743; d. Islesworth, 19 June 1820. While in Oxford he began to manifest a strong love of botany and other branches of natural history, to which his attention had already been turned from about the age of 14. He formed a volunteer class in the university and brought Mr. Lyons from Cambridge to teach it. In May 1766 he was chosen a member of the Royal Society, and in the following summer he went to Newfoundland and proceeded to Hudson Bay to collect plants. In 1768 he, with Dr. Solander, a pupil of Linnæus and assistant librarian at the British Museum, accompanied Cook on his voyage of discovery, Banks being appointed naturalist to the expedition. In an expedition into the interior of the desolate Tierra del Fuego, for the purpose of examining the country, the two naturalists narrowly escaped perishing with cold. Banks procured the introduction of the bread-fruit tree into the West Indies, and he wrote the botanical observations in the account of Cook's voyages. In 1772 he visited Iceland with Dr. Solander, in order to make himself acquainted with its natural productions. During this voyage the Hebrides were examined, and the columnar stratification of the rocks surrounding the caves of Staffa was made known to naturalists for the first time. After the resignation of Sir John Pringle in 1777 Banks was chosen president of the Royal Society. In 1781 he was made a baronet. The French chose him a member of the National Institute in 1802, because to his intercession they owed the recovery of the papers of La Peyrouse relating to his voyage, which had fallen into the hands of the British. His library and his collections in natural history are celebrated. Besides some essays, periodical publications, and some contributions to the transactions of learned societies, he wrote nothing but 'A Short Account of the Causes of the Blight, the Mildew, and the Rust in Corn' (1805). In accordance with a contingent bequest his collections were added to the British Museum. The genus *Banksia,* of the natural order *Proteaceæ,* was named in honor of him by the younger Linnæus.

Banks, Nathaniel Prentiss, American soldier and statesman: b. Waltham, Mass., 30 Jan. 1816; d. there 1 Sept. 1894. Entirely self-taught, he worked himself up from the position of bobbin-boy in a cotton factory to the editorship of a weekly newspaper. He read law, was admitted to the bar, and began to practise, but soon became active in politics. Elected to the Massachusetts legislature in 1849, he became speaker in 1851–2. In 1853 he was president of the Massachusetts Constitutional Convention, and the same year was elected to Congress as a Coalition Democrat. The session which began 3 Dec. 1855, was memorable for its bitter speakership contest, the candidates being Banks and William Aiken, a large slaveholder of South Carolina. The contest lasted two months, the President's message being withheld, and all legislative business blocked. The sergeant-at-arms borrowed $20,000 from a Philadelphia bank in order to make advances to needy members of both parties. On the 133d ballot, 2 Feb. 1856, Mr. Banks was elected. None of his decisions while speaker were ever reversed by the House. He was governor of Massachusetts, 1857–9. In 1861 President Lincoln appointed him major-general of volunteers. He conducted active operations in the Shenandoah valley and fought with credit at Winchester and Cedar Mountain. In co-operation with Admirals Farragut and Porter he invested Port Hudson and unsuccessfully attempted to carry it by assault. In 1864, much against his judgment, he was placed in command of the Red River Expedition, which resulted most disastrously for the Federal forces. Banks was widely censured and soon relieved of his command. Gen. Grant, years later, in his 'Memoirs' furnished a full vindication of Banks by giving the name of the superior officer responsible for the expedition. From 1866 to 1876 Gen. Banks represented his old district in Congress, and was prominent as chairman of the Committee on Foreign Relations. He was United States marshal for Massachusetts, 1879–88. In 1891 Congress bestowed on him an annual pension of $1,200, a severe mental disorder having come upon him.

Banks, Thomas, English sculptor: b. Lambeth, 29 Dec. 1735; d. 2 Feb. 1805. He studied sculpture in the Royal Academy, and was sent,

as one of its students, to Italy. Here he executed several excellent pieces, particularly a bas-relief representing Caractacus and his family before Claudius, and a Cupid catching a butterfly. Among other works executed by him was a colossal statue showing Achilles enraged for the loss of Briseis, now in the entrance hall of the Royal Academy. He was also the sculptor of the admired monument of Sir Eyre Coote in Westminster Abbey, and of those of Dr. Watts and Woollett. He was elected a member of the Royal Academy in 1785.

Banks, a nautical term applied to shelving elevations in the sea or the bed of a river, rising to or near the surface, composed of sand, mud, or gravel. When tolerably smooth at the top they constitute shallows, shoals, and flats; but when rocky become reefs, ridges, keys, etc. A good chart always defines them, indicating whether they are sands or rocky.

Banks Land, an island in the Arctic Ocean, discovered by Parry in 1819, explored by McClure in 1850, and named by him Baring Island. It is separated by Banks Strait from Melville Island, lying to the northwest, and by Prince of Wales Strait from Prince Albert Land, lying eastward.

Banks and Banking. In specific relation to his customer the banker occupies the position of debtor to creditor, holding money which the customer may demand at any time in whole or in part by means of a check payable at sight on presentation during banking hours. For the refusal to cash a check from the erroneous supposition that he has no funds of his customer's in his hands, or for misleading statements respecting the position in which the bank stands, the banker is legally responsible. Moreover, the law regards him as bound to know his customer's signature, and the loss falls upon him in event of his cashing a forged check. In their relations to the community, the chief services rendered by banks are the following: By receiving deposits of money, and massing in sums efficient for extensive enterprises the smaller savings of individuals, they are the means of keeping fully and constantly employed a large portion of the capital of the community which, but for their agency, would be unproductive; they are the means by which the surplus capital of one part of a country is transferred to another; where it may be advantageously employed in stimulating industry; they enable vast and numerous money transactions to be carried on without the intervention of coin or notes at all, thus obviating trouble, risk and expense. The mechanism by which the last of these benefits is secured is to be found in perfection in the clearing-house system.

History.—Although banking operations on a considerable scale appear to have been conducted by the ancients, modern banking must be regarded as having had an independent origin in the reviving civilization of the Middle Ages. In the 12th century almost the whole trade of Europe was in the hands of the Italian cities, and in these the need of bankers was first felt. The earliest public bank, that of Venice, established in 1171, and existing down to the dissolution of the republic in 1797, was for some time a bank of deposit only, the government being responsible for the deposits, and the whole capital being in effect a public loan. In the early periods of the operations of this bank deposits could not be withdrawn, but the depositor had a credit at the bank to the amount deposited, this credit being transferable to another person in place of money payment. Subsequently deposits were allowed to be withdrawn, the original system proving inconvenient outside the Venetian boundaries. It was, however, less from the Bank of Venice than from the Florentine bankers of the 13th and 14th centuries that modern banking especially dates, the magnitude of their operations being indicated by the fact that between 1430 and 1433, 76 bankers of Florence issued on loan nearly 5,000,000 gold florins. The Bank of St. George at Genoa also furnished a striking chapter in financial history. The important Bank of Amsterdam, taken by Adam Smith as a type of the older banks, was established in 1609, and owed its origin to the fluctuation and uncertainty induced by the clipped and worn currency. The object of the institution (established under guarantee of the city) was to give a certain and unquestionable value to a bill on Amsterdam; and for this purpose the various coins were received in deposit at the bank at their real value in standard coin, less a small charge for recoinage and expense of management. For the amount deposited a credit was opened on the books of the bank, by the transfer of which payments could be made, this so-called bank money being of uniform value as representing money at the mint standard. It bore, therefore, an *agio* or premium above the worn coin currency, and it was legally compulsory to make all payments of 600 guilders and upward in bank money. The deposits were supposed to remain in the coffers of the bank, but were secretly traded with in the 18th century till the collapse of the bank in 1790. Banks of similar character were established at Nuremberg and other towns, the most important being the Bank of Hamburg, founded in 1619. In England there was no corresponding institution, the London merchants being in the habit of lodging their money at the Mint in the Tower, until Charles I. appropriated the whole of it (£200,000) in 1640. Thenceforth they lodged it with the goldsmiths, who began to do banking business in a small way, encouraging deposits by allowing interest (4d. a day) for their use, lending money for short periods, discounting bills, etc. The bank-note was first invented and issued in 1690 by the Bank of Sweden, founded by Palmstruck in 1688, and one of the most successful of banking establishments. About the same time the banks of England and Scotland began to take shape, opening up a new era in the financing of commerce and industry.

Bank of England.—The Bank of England, the most important banking establishment in the world, was projected by William Paterson, afterward the promoter of the disastrous Darien scheme. It was the first public bank in the United Kingdom, and was chartered in 1694 by an act which, among other things, secured certain recompenses to such persons as should advance the sum of £1,500,000 toward carrying

on the war against France. Subscribers to the loan became, under the act, stockholders, to the amount of their respective subscriptions, in the capital stock of a corporation denominated the Governor and Company of the Bank of England. The company thus formed advanced to the government £1,200,000 at an interest of 8 per cent — the government making an additional bonus or allowance to the bank of £4,000 annually for the management of this loan (which, in fact, constituted the capital of the bank), and for settling the interest and making transfers, etc., among the various stockholders. This bank, like that of Venice, was thus originally an engine of the government, and not a mere commercial establishment. Its capital has been added to from time to time, the original capital of £1,200,000 having increased to £14,553,000, in 1816, since which no further augmentation has taken place. There exists besides, however, a variable "rest" of over £3,000,000. The charter of the bank was originally granted for 11 years certain, or till a year's notice after 1 Aug. 1705. It was subsequently renewed for various periods in 1697, 1708, 1713, 1742, 1764, 1781, 1800, 1833, and 1844, certain conditions which the bank had to fulfill being specified at each renewal. On this last occasion it was continued till 12 months' notice from 1855. At the same time the issue department of the bank was established as distinct from the general banking department, the sole business entrusted to the former being the issue of notes. By this arrangement the bank was authorized to issue notes to the value of £14,000,000 upon securities especially set apart, the most important of the securities being the sum of £11,015,100 due to the bank by the government, together with so much of the coin and bullion then held by the bank as was not required by the banking department. The bank has since been permitted to increase its issue on securities to £15,750,000, but for every note that the issue department may issue beyond the total sum of £15,750,000 an equivalent amount of coin or bullion must be paid into the coffers of the bank. The Bank of England notes are, therefore, really equivalent to, and at any time convertible into, gold, as it is in the utmost degree improbable that any drain on the treasure in the bank will reduce the outstanding notes below £15,750,000. They are (like all English bank-notes) of the value of £5 and upward, and are legal tender throughout England. Notes once issued by the bank and returned to it are not reissued but destroyed — a system adopted in order to facilitate the keeping of an account of the numbers of the notes in circulation, and so prevent forgery.

In compliance also with the act of 1844 the bank is compelled to publish a weekly account. The following shows the condition of the bank on 21 Jan. 1903: Issue department: notes issued, £49,666,245; securities, £18,175,000; gold, coin, and bullion, £31,491,245. Banking department: capital and "rest," £18,103,048; deposits and post bills, £50,670,747; securities, £45,438,969; notes in the reserve, £21,314,325; and gold and silver coin, £2,020,501.

The total of the notes given out by the issue department is called the issue circulation, the portion of it in the hands of the public being the active circulation, and that still in the banking department being the note reserve. This note reserve represents really the amount of bullion in the issue department available for the use of the banking department. Of the other items in the account it may be noted that the proprietors' "rest" is a varying surplus increased always by accumulated profits up to 5 April and 10 October, when the bank dividends are paid to the shareholders; and that the public deposits, which include sums lodged on account of the customs, inland revenue, etc., increase through revenue receipts until the dividend terms in January, April, July, and October. The other or private deposits comprise those of bankers, merchants, and other persons. An increase in these private deposits indicates an increase of monetary ease, while a decrease informs us that bankers, merchants, and traders have calls upon them for money. A better indication of the demand for money is furnished, however, by the advances on commercial securities, and it is by this and the condition of the reserve that the bank rate of discount is regulated. When the reserve is high and the advances moderate the discount rate is low, and it is raised according as the reserve falls and advances are more in request, especially during an adverse foreign exchange and drain of gold. Gold is thus restrained from going abroad, and its influx into the country is encouraged. In addition to the profits which the bank may make by ordinary banking business, it receives an allowance for the management of the national debt, etc., at the rate of £300 per million on £6,000,000, and £150 per million on all debt above that sum. It also derives a profit from the foreign coin and bullion brought to it, for which it pays £3 17s. 9d., or 1½d. per ounce less than the real value.

The management of the bank is in the hands of a governor, deputy-governor and 24 directors, elected by stockholders who have held £500 of stock for six months previous to the election. A director is required to hold £2,000, a deputy-governor £3,000, and a governor £4,000 of the stock. The court or board of directors meets every Thursday, when the weekly account is presented.

Bank of France.—The Bank of France is second in importance only to the Bank of England. It was established in 1800, at first with a capital of 45,000,000 francs, and with the exclusive privilege in Paris of issuing notes payable to bearer, a privilege which was extended in 1848 to cover the whole of France. It has numerous branches in the larger towns, a number of these having been acquired in 1848, when certain joint-stock banks of issue were by government decree incorporated with the Bank of France, the capital of which was then increased to 91,250,000 francs, in 91,250 shares of 1,000 francs each. In 1857 the capital was doubled, and, besides this, it has a large surplus capital or "rest." Like the Bank of England, it is a bank of deposit, discount, and circulation, and is a large creditor of the state. The government appoints the governor and two deputy governors, who are all required to be stockholders. There is also a body of 15 directors and 3 censors, nominated by the shareholders.

The capital stock of the Bank of France is 182,500,000 francs. As shown by statement of resources and liabilities dated 22 Jan. 1903 the surplus and other profits of the bank amounted to 42,515,000 francs, and its outstanding circula-

tion to 4,431,801,910. The total assets of the bank were 5,262,099,592, of which 3,601,126,067 consisted of specie divided as follows: Gold, 2,508,805,839; silver, 1,092,320,228.

National Banks of the United States.—The table below, compiled from the report of the comptroller of the currency (30 Jan. 1905), gives a comprehensive view of the development of the national banking system in recent years.

On 11 Jan. 1905, 5,528 national banking associations filed reports of condition with the comptroller of the currency. The paid-in capital stock of the reporting banks was $776,916,147; surplus funds and other undivided profits, $466,177,675 and $183,994,737, respectively. The outstanding circulating notes of the reporting banks amounted to $424,345,433 and their individual deposits to $3,612,499,599. The aggregate resources of the associations were $7,117,800,553, an increase since 22 Jan. 1904 of $540,922,390. Against deposit liabilities of $4,416,877,711, a reserve was held aggregating $1,008,064,321.

The volume of the exchanges of the 98 clearing houses of the United States for the year ended 30 Sept. 1904 amounted to $102,150,313,982, against $113,963,298,913 for the year ended 30 Sept. 1903, the net decrease being $11,812,984,931. See BANKS AND BANKING, AMERICAN, and BANKS, UNITED STATES NATIONAL.

Recent Rapid Growth.—From 14 March 1900 to 31 March 1903—3 years and 17 days—1,442 new banks were organized. They were capitalized and distributed as follows:

STATE	No.	Capital	Bonds Deposited
Alabama	16	$ 777,500	$ 205,000
Arizona	6	205,000	51,500
Arkansas	5	200,000	50,250
California	19	4,205,000	549,000
Colorado	20	1,065,000	280,750
Connecticut	3	100,000	35,500
Delaware	2	50,000	25,000
Florida	6	410,000	117,500
Georgia	22	1,365,000	319,250
Hawaii	2	525,000	56,500
Idaho	9	250,000	62,550
Illinois	80	5,710,000	1,544,050
Indiana	49	3,030,000	839,300
Indian Territory	64	1,970,000	524,400
Iowa	73	2,445,000	807,250
Kansas	38	1,490,000	479,750
Kentucky	24	2,620,000	498,300
Louisiana	12	875,000	194,000
Maine	5	250,000	69,500
Maryland	20	1,107,000	286,450
Massachusetts	5	2,150,000	175,000
Michigan	12	2,565,000	242 300
Minnesota	95	3,406,000	988,900
Mississippi	8	725,000	235,000

Number of new banks			1,442
Capital			$86,135,500
Bonds deposited			20,375,500

Nine hundred and fifty-seven of these took advantage of the law of 14 March 1900, permitting the establishment of $25,000 banks. The remaining 485 were banks of $50,000 and over capital. These figures include 622 converted State and private banks. During March 1903, 56 banks were organized, distributed as follows:

Middle States	22	banks	$700,000 capital
Western States	13	banks,	405,000 capital
Southern States	12	banks,	630,000 capital
Eastern States	8	banks,	400,000 capital
Pacific Territories	1	bank,	25,000 capital
Number of new banks in one month			56
Capital			$2,170,000

THE NATIONAL BANKS OF THE UNITED STATES.

1903	4,805	735,314,217	362,497,812.00	63,565,847.00	109,881,530.00	8.80	5.91	10.21
1904	5,244	765,948,330	398,299,071.00	75,588,890.00	112,936,427.00	9.93	6.57	9.81

The number of new banks in the manufacturing States is very marked. Ohio, 85; Indiana, 49; Illinois, 80; Pennsylvania, 169; New York, 55. The agricultural States also show up well, with 166 for Texas, 95 for Minnesota, 69 for Oklahoma, and 64 for Indian Territory.

By groups of States the showing is:

	No.	Capital	Bonds Deposited
New England States	18	$ 3,250,000	$ 415,500
Eastern States	269	23,204,000	4,646,900
Southern States	346	16,825,500	4,477,250
Middle States	440	26,751,000	6,842,700
Western States	315	10,160,000	3,041,100
Pacific States	51	5,320,000	846,050
Islands	3	625,000	106,500

The $20,375,500 of bonds deposited against circulation is a fraction less than 24 per cent of the capital, the latter being the measure of the maximum amount of circulation issuable. Our total national bank figures for 31 March 1903 were:

		Increase since 14 March, 1900
Number of banks	4,869	1,252
Capital	$739,178,695	$122,870,600
Bonds on deposit	342,160,770	97,549,200
Circulation secured by bonds	338,349,814	
Circulation secured by lawful money	44,169,444	128,116,528

UNITED STATES CURRENCY CIRCULATION.

1904	2,519,142,860	30.77

Currency Act of 1900.—On 14 March 1900 President McKinley approved a new currency act, which, among other things, established the gold dollar as the standard unit of value, and placed at a parity with that standard all forms of money issued or coined by the United States. The bill also made a number of important changes in the regulations governing national banks. The new law permits national banks with $25,000 capital to be organized in places of 3,000 inhabitants or less, whereas the minimum capital previously was $50,000. It also permits banks to issue circulation on all classes of bonds deposited up to the par value of the bonds, instead of 90 per cent of their face, as before. This act also reduces the semi-annual duty on national bank circulation secured by 2 per cent consols of 1930 to one fourth of 1 per cent. As a result of this legislation the outstanding circulation of national banks increased over $100,000,000 between the date of passage of the act and 31 Oct. 1901.

From 14 March 1900 to 31 Oct. 1904 there were organized 2,196 national banking associations, with an authorized capital aggregating $125,512,300, and with bonds as security for circulation of $31,331,250. Of this total number, there were 1,437 banks with an aggregate capital of $37,459,500, whose individual capital was less than $50,000, the average but slightly in excess of the minimum, namely, $25,000. The number of banking institutions in the country, by reason of these organizations, was only increased to the number of 1,230, as 250 of the associations were conversions of State banks, and 716 reorganizations of State or private banks liquidated for the purpose.

During the existence of the national banking system, up to 31 Oct. 1904, there were organized 7,460 national banking associations, of which number 1,548 were placed in liquidation either by vote of stockholders or by expiration of charters, and 417 in charge of receivers, leaving in active operation on the date mentioned 5,495 banks, with capital stock of $781,126,335. These associations had on deposit with the treasurer of the United States, in trust, as security for circulation, bonds to the amount of $426,544,790, on which circulation had been issued (on that date) to the amount of $424,530,581. In addition to circulation secured by bonds there were outstanding notes to the amount of $32,750,919, secured by the deposits of lawful money. The increase of national bank circulation from 14 March 1900 to 31 Oct. 1904 was, in round numbers, 202.9 million dollars.

On 12 April 1902 the act was approved, authorizing the extension, for a period of 20 years, of the charter of national banking associations which had been extended under the act of 12 July 1882. From the date of the passage of the extension act of 1902 to 31 Oct. 1904 the corporate existence of 315 banks, with a capital of $88,310,300, was extended for a second time.

O. P. Austin,
United States Treasury Department.

Banks and Banking, American. The history of banking in America opens in those trying days of the Revolutionary War, when the new republic, trembling on the verge of disaster, groped out so blindly in search of some adequate means of financial relief. At that moment, however, there were some master minds that were found capable of meeting such an emergency, and it requires no stretch of the imagination to discover that the aid given by their advice was of incalculable importance at this critical period in the nation's history.

Of course, it is true that banking methods in America have undergone many radical changes since the days of the country's

infancy, and yet, as we review the past, it is impossible not to admit that the systems in vogue in the United States have always been more or less sound. They have changed because conditions have changed, and not so much because they were based upon mistaken ideas. Adapted to the needs of the times they served, they remained in operation until altered conditions had made them obsolete, but then, just as promptly as necessity required, they were altered to meet the effect of the new conditions. See UNITED STATES FINANCES OF 1775–1789.

In the beginning of the financial history of the Republic — a little more than a century ago — the fiscal affairs of the United States were in the hands of the «Bank of the United States,» a national institution which had been modelled quite closely upon the lines of the old Bank of England. With the exception of a brief period just prior to and including the War of 1812, this institution remained as the great American financial power, and its final abandonment was the occasion of one of the most bitter political struggles of which we have any record.

It was through the efforts of Andrew Jackson and his successor, Martin Van Buren, that the State bank system came into existence as a substitute for the former single dominant power, and for more than a quarter of a century this system represented the American method of banking. That it had its good points there can be no doubt. That many of the State banks were as sound and solvent as any banking institution in the world to-day is not a matter for question. Unfortunately, however, there were some of them that could not be classified as «sound» banks, and as there was no uniform basis for their government, no power that should say at what point their operations became dangerous or unwise, the weakness of the system exhibited itself in the discounting of a currency that became more and more demoralized in proportion to its distance from the bank which was responsible for its issuance.

When the Civil War came, with all its insistant demands upon the resources of the country, it was found that this method of banking was utterly unable to respond to the requirements of the new conditions. It was to meet this emergency that another new system was devised, and it is this system that is in use to-day. Around it some of the greatest financial institutions of the world have been developed, for it would be almost impossible to imagine a system that could be more conducive to natural growth and expansion. By avoiding any great centralization of power it distributes its beneficent influence throughout the country. By placing the pledge of the Federal Government upon every banknote issued it makes the contingency of a discounted and demoralized currency impossible.

To trace in detail the history of American banking it is necessary to go back to 1780, when the first bank established in the United States was opened in Carpenters' Hall, Philadelphia. It was known as the Pennsylvania Bank, and was organized, upon personal credit alone, by Robert Morris, George Clymer and a few other gentleman, who took as their only security, the bills that a desperate Congress had drawn upon John Jay, who was then employed in negotiating a loan in Spain. Its object, therefore, was mainly a patriotic one, for practically all its efforts were devoted to the aid of the government in its work of transporting troops and maintaining an army which was then in desperate need of every kind of assistance. Later, when Mr. Morris had been appointed superintendent of finance, and the bank which he had founded had gone out of existence, it was at his request that Congress issued to him and his associates the charter for the new Bank of North America. In January, 1781, this new institution began its business operation in Philadelphia, with Thomas Willing as its first president, and a board of 12 directors. With a capital of $400,000 it conducted its business on a specie basis, its notes having the weight of legal tender. In addition to its national charter, it received a similar authorization from the State of Pennsylvania, and, as it was then the only banking institution in the country, its profits began to accumulate so rapidly that, in the years 1783 and 1784, it was able to declare dividends of 14 per cent. Naturally enough such evidences of prosperity attracted attention, and it was not long before another coterie of wealthy merchants formed a project to open a rival bank. They even went so far as to apply for a charter, but, before the necessary act was passed, the Bank of North America squelched the threatening opposition by permitting its projectors to participate freely in the old bank's new issue of $500,000 worth of stock. In 1787 it was rechartered as a State bank by an act of the Pennsylvania legislature, and with several legislative changes it has continued to exist as a prosperous financial institution.

It was not until 1784 that a similar banking house was established in the city of New York. During the several years that had elapsed since the formation of the Bank of Pennsylvania the merchants of New York had been appropriately interested in the Philadelphia experiment. At one time a number of the prominent business men of the city assembled and discussed the possibility of creating a bank upon a plan which was later dubbed by its opponents as the «land» bank scheme. According to this project only a small part of the capital of this institution was required to be paid in specie, the balance being issued against sight notes, themselves payable in specie and secured by land accepted at one-third of its value. As this plan met with the influential support of Chancellor Livingston it was nearly carried through the legislature to which it had applied for a charter, but finally, and chiefly through the personal efforts of Alexander Hamilton, the passage of the act was defeated.

As the demand for the establishment of a local banking institution became more insistent, however, several of the most prominent business men of New York responded

to a call for a meeting which was held at the Merchants' Coffee House, on 22 Feb. 1784. Gen. Alexander MacDougal presided, and when, after a long discussion of the subject, it was decided to start the bank, he was further honored by election as its first president. It was determined that the bank should begin operations with a capital of $500,000, either gold or silver, divided into 1,000 shares and, when, on 15 March, the first 500 shares had been taken, the corporation was organized with Samuel Franklin, Robert Bowne, Comfort Sands, Alexander Hamilton, Joshua Waddington, Thomas Randall, William Maxwell, Nicholas Low, Daniel McCormick, Isaac Roosevelt, Joshua Vanderbilt and Thomas B. Stoughton, as its directors. William Seton was elected cashier, but the New York business men of that day were so ignorant of everything associated with the organization of a bank and with methods of banking in general, that the new cashier was obliged to go to Philadelphia in search of necessary instruction respecting the nature of his duties. During his absence the directors perfected their arrangements, and, as they had not secured their charter, they decided to operate without one. Accordingly the doors were opened to the public, 9 June 1784, the institution, which was know as the Bank of New York, being located in a three-story, yellow brick house at No. 67 St. George's (now Franklin) Square.

Slight as their experience with banking institutions had been there were many persons in those days who believed that banks were antagonistic to the best interests of the community. During the years 1785 and 1786, therefore, when the evils due to the scarcity of currency began to make themselves felt, popular opinion became very strongly opposed to the entire system, it being held that the banks were hoarding the specie which was so badly needed in the commercial world. To meet the exigencies of the occasion, several of the States in which the feeling rose highest, proceeded to issue paper money by vote of the legislature, but as this action accomplished no other purpose than to temporarily allay the demand for currency, this same lack of confidence in the banks and their purpose prevailed when, under the newly adopted Constitution, Gen. Washington was elected to the Presidency, and Alexander Hamilton took his seat as the first secretary of the treasury. Under his famous financial policy the national Government not only assumed and bonded the debts contracted by the Continental Congress, as well as those contracted by the several colonies during the progress of the war, but it went a step further by establishing, in 1791, the Bank of the United States.

Established under a 20-year charter, this institution was devised to act as the fiscal agent of the Government and to serve as the depository of all public moneys. Its capital was fixed at $10,000,000, divided into 25,000 shares of $400 each, payable one-fourth in specie and three-fourths in six per cent. stocks of the United States. It was further authorized to hold property of all kinds to an amount not exceeding $15,000,000, inclusive of its capital stock; was permitted to issue its notes, payable in specie, and could establish branch banks, in various cities throughout the country. Accepted as the direct agent of the United States Government in every important particular, it is not strange that the institution should have prospered and that, during its entire career, its annual dividends ranged from 8 to 10 per cent. The first branch bank opened by the Bank of the United States was an office of deposit and discount in New York.

As prosperity soon returned under the beneficent influence of Hamilton's wise financial policy the confidence in the American institutions was again quite generally restored, and, while it is true that the spirit of speculation, which was eventually let loose in the land, resulted in a stringency in the currency that would undoubtedly have resulted seriously if Alexander Hamilton and the United States Treasury had not come to the relief of the business community, not once, but three times, business continued to improve.

In New York, however, the sentiment of opposition to the banking system was still so strong that every political influence was exerted to prevent the granting of any new charters. As the banking field, despite this sentiment, was by no means overcrowded, several ineffectual efforts had been made to establish new institutions, and finally, a company headed by Aaron Burr found a means to overcome the difficulties. In 1799, they applied to the legislature and by it were granted a charter for a company which ostensibly proposed to provide pure water for the city of New York. The capital of this corporation, which was known as the Manhattan Company, was fixed at $2,000,000, but, unnoticed by the politicians who had been so active in their opposition to the banking interests, there was a clause in this charter which, after specifying that the capital of the company was to be devoted to the establishment of a water supply, also provided that the surplus might be "employed in the purchase of public or other stocks or other moneyed transactions or operations not inconsistent with the laws and constitution of the State of New York."

It is, of course, unnecessary to add that a corporation with such a clause in its charter found little difficulty in securing the funds requisite to the opening of a new bank. By 1803, however, the establishment of banks had become so general that there were no less than 40 in operation in various parts of the country.

As Congress failed to renew the charter of the Bank of the United States, and as the expiration of this act, in 1811, was almost immediately followed by war with Great Britain, the financial position of the country was a most unsatisfactory one. Having depended upon the Bank of the United States for its credit, the Government had little of its own, and it was, therefor, compelled to depend to a large degree upon the already established banks. There were many of these

institutions, all under State charter, and no less than 123 new ones were created during the four years following the closure of the Bank of the United States. The aggregate capital of all these banks was in excess of $40,000,000, and the face value of the notes which they had issued represented fully $200,000,000. Of this sum a large portion had been issued in the form of loans to the Government, and, at such a time as this, when public credit was prostrated, the strain upon the banks was too great for them to bear. On 1 Sept. 1814, therefore, specie payment was suspended.

It was during this critical stage in the financial history of the nation that the private bank began to assume a position of importance in the commercial world. In 1811, as soon as it had been found that it would be impossible for the Bank of the United States to continue its operations, the building and stock of the institution were purchased by Stephen Girard, a Philadelphia merchant, who proceeded to carry on the business upon his own responsibility. In the beginning his capital was but $1,200,000, but this was eventually increased to $4,000,000.

Moreover, if anything further was necessary to call the attention of the public to this great private institution, Girard's exhibition of patriotism soon made his name known from one end of the land to the other. It was during the last year of the war, at a time when money was the one factor that was necessary to assure a renewal of peace, that the United States Treasury, devoid of funds, discovered that the money it needed was not forthcoming. In desperation the Treasury officials attempted to float a loan for $5,000,000, but, of this amount scarcely $20,000 had been subscribed when Girard, acting solely upon his own faith in the stability of the Government, volunteered to subscribe for the entire loan.

Taught by experience that it would be unwise to remain longer without an accredited fiscal agent one of the first acts of Congress was to grant a new 20-year charter to the Bank of the United States. In accordance with the provisions of this act of incorporation the capital of the new institution was fixed at $35,000,000, divided into 350,000 shares of $1,000 each. Of this amount $7,000,000 was held by the United States Government, while the remainder of the stock was easily disposed of. The bank issued its notes, in amount not less than $5, payable in specie on demand, and transacted a general banking business so successfully that its stock was quoted at 50 per cent. above par. By the provisions of the act of incorporation the operations of the institution were placed in the hands of a board of directors composed of 25 members, five of whom were stockholders selected by the President of the United States. The active direction of affairs, however, was left to a special board of seven directors, chosen by the general board, and headed by the President. In January, 1817, therefore, this new institution began its operations, and its efforts were regarded so favorably that it soon established branch banks in all the important cities throughout the country. In 1830, there were no less than 27 of these branch banks, all engaged in doing a thriving business.

With such a reliable institution at their command it is not surprising that the people should have looked with no little mistrust upon the unsatisfactory methods pursued by the State banks. As soon as the new charter had been issued to the Bank of the United States it was apparent to everybody that the State institutions would either be compelled to resume specie payment, or, as the only alternative, pass out of existence. As the result many of them closed their doors, so many, in fact, that, of the 446 State banks then in operation, only 165 remained. At the same time the aggregate State banking capital of the whole country for the year 1814, $90,000,000, showed a withdrawal of only $30,000,000 by reason of these suspensions. Of this sum only $5,000,000 was an actual loss, this amount being apportioned between the Government and the individual holders. At the same time such institutions continued in existence and precautionary laws to govern their operation were enacted by the legislatures of many States. In April, 1829, for example, the New York legislature adopted a general banking law which was known as the "Safety Fund Act." According to its provisions banks were permitted to issue notes for general circulation to an amount not in excess of twice their capital, while the amount of possible loans was restricted to two and a half times their capital. To make good the payment of the circulation and other debts of banks that might become insolvent a guarantee fund was created by means of which the banks made an annual payment of one-half of one per cent. on their capital stock to the State treasury until a total of three per cent. had been paid.

During the period in which so many of the prominent financial leaders of the country were engaged in the work of reconstructing the Bank of the United States, several Philadelphia business men determined to establish an institution in which persons of meagre income might find it possible to deposit their small savings. In 1816, therefore, the first savings bank was opened in America. It was known as the Philadelphia Saving Fund Society. During the same year a bank of similar character was established in Boston, a third was opened in New York in 1819, and, by the close of 1820, the idea had extended so far that there were no less than 10 savings banks engaged in business in the country, with 8,635 depositors and deposits amounting to more than $1,000,000. See BANKS, BANKING.

During the many years of its existence the Bank of the United States continued to increase in prosperity and influence. On 1 Nov. 1832 it reported that its total liabilities, including such of its notes as were in circulation, its deposits and all other debts, aggregated $37,296,950.20. At the same time, its assets, including specie, cash in Europe, and debts from reliable industrial and banking corporations, were $79,593,870.97. As this left a surplus of $42,296,920.77, the bank was then unquestionably one of the

richest institutions in the world. In 1832, there was no reason to doubt the stability of such a financial establishment.

Strange as it may seem, however, it was nothing less than this continued prosperity that brought about the downfall of the Bank of the United States. At the time of Jackson's election to the Presidency the opposition to it was so strong that he declared that it should not be rechartered, and, when he had taken his seat, he made this promise good by announcing that he should refuse to sign any act that might have a tendency to extend the life of the institution, explaining his position on the ground that such a financial system as that which it represented was not only unconstitutional but was also extremely dangerous to the liberties of the nation. In spite of the fact that the prosperity of the country had been so great during the 20 years of this bank's operations that the Government not only had been able to pay its war debt but actually had a surplus of $40,000,000 on hand, the public funds were withdrawn from the institution at the earliest possible moment, and the surplus, by vote of Congress, was distributed among the States.

It is not difficult to understand that this blow was one from which no financial establishment could easily recover. Its charter threatened, its deposits withdrawn and scattered to the four winds, and with all its operations the object of the enmity of an unrelentingly adverse administration, there seemed to be no alternative but to cease the transaction of business. Determined that he would not give President Jackson the satisfaction of closing its doors, its president, Nicholas Biddle, persuaded the State legislature of Pennsylvania to pass an act incorporating it as the Pennsylvania Bank of the United States, but, while he thus had the satisfaction of stealing a march on the administration, his efforts to save the life of the bank were useless and four years later, in 1840, it finally retired from business.

Such a mishap to such an institution as the Bank of the United States gave the State banks the chance for which they had long been waiting and they proceeded to make the most of it. The demise of the national institution had left the field open to them, and just at the moment when such aid was most needed, the distribution of the public moneys among the several States had come to give an impetus to their deposits. As the result of this favorable combination of circumstances the State legislatures were kept busy granting charters to new State banks, and, by 1837, their number had increased to such an extent that there was no less than 634 of them in the country, their aggregate capital being more than $290,000,000.

In disrupting the established financial system of the country, however, President Jackson had not looked sufficiently far ahead to be able to anticipate the possible troubles that might arise as the result of his action. He had closed the Bank of the United States, but he had provided for no other responsible authority to take its place. When the financial affairs of the country were turned over to the State banks, therefore, the temporary prosperity which followed the appearance of the new issues of State bank-notes assumed the form of the wildest kind of speculation. For a time public lands were chosen as the field for the speculator's operations, and the dealings represented many millions of dollars. As everything was based upon the currency notes, however, and as many of these were worthless, because issued by insolvent, or "wild-cat" banks, it did not take long for men acquainted with the principles of finance to recognize the fact that trouble was inevitable. It was at this time that President Jackson determined to make an effort to establish the finances of the country upon a more sound basis, and, in the hope of assisting in the accomplishment of this purpose, he issued his famous "Specie Circular," in which he notified all agents of public-lands that they must accept nothing but specie in payment.

It was this command that precipitated matters, for the banks, being called upon to redeem all their circulation in specie, were unable to respond, and so, on 9 May 1837, they again suspended payment. Months passed, but no relief came. Accordingly, in the following November, a conference was held in New York to see if some means could not be devised by which the banks would be able to resume payment. No less than 136 banks were represented in this gathering, but, in spite of the fact that many suggestions were made, no plan of relief was deemed practicable. Compelled to take cognizance of a situation which had been so directly the result of the administration's financial policy, President Van Buren, 1837, proposed the sub-treasury plan as a measure which would tend to prevent the loss of public moneys through the failure of banks. Wise as the suggestion was from the governmental point of view, the fact that it presented no remedy to the present difficulties made it an extremely unpopular measure. As the result it was defeated, and, three years later, when it was passed, it was promptly repealed again in the succeeding year. Not until five years later was it finally re-enacted. UNITED STATES: FINANCES OF THE, 1816–1861.

During all this time the State banks were increasing in number. It is true that they were constantly in trouble. The New York banks did not resume payment until May, 1838, and, although they were followed by the Philadelphia and Southern banks in August, the latter were able to hold out much more than a year, suspending payment again on 9 Sept. 1839. In spite of the lack of confidence which such uncertainty necessarily engendered, however, the growth of the country and the exigencies of business resulting from such widening of interests created a demand for more banking houses. In 1840, the number of such banks had increased to 901, and their total capital to $358,000,000.

Of course, during all this period the demand for a national banking system had been constantly increasing, and one of the great issues upon which Gen. Harrison's presidential campaign was fought and won provided that a

new bank should be incorporated at the first possible moment after his inauguration. Fully in sympathy with this project, President Harrison called a special session of Congress to devise the best means of fulfilling his promise, but when he died, before Congress had convened, those who fought so strenously for a return of the old national banking system lost their most influential supporter. President Harrison's successor, President Tyler, was so unalterably opposed to the movement that he twice vetoed the measure to "establish a financial agent of the government" "to act for it in all fiscal matters, and to facilitate mercantile exchanges throughout the country", even when the matter had been passed by Congress and was presented in the form of a bill awaiting his signature. Among all the banks, at this period, none stood so high in public estimation as those which were located in the New England States. During the periods of uncertainty the New England banks had been less affected than those of any other section, a situation which was largely due to the fact that they had adopted what was then known as the "Suffolk Bank System." In other words, they had bound themselves to an agreement by which the Suffolk Bank of Boston was charged with the duty of redemption and collection for all the banks in the New England territory. To facilitate such operations each bank maintained a stipulated deposit with the Suffolk Bank.

The stringency of 1840–43 represents another critical period in the financial history of the United States, but the better times which followed had succeeded in doing little more than to ease the situation when a great impetus was given to national prosperity by the discovery of gold in California. For several years this influence was paramount in American affairs, and, under these new conditions, the bank system, for a time, ceased to trouble.

It was during this period in the financial history of the country that the first clearing-house project was devised and carried into effect. For several years American bankers had felt that they were in need of better facilities in their work of transacting the business of the country, and it was to meet this demand that the New York Clearing House Association was formed, on 11 Oct. 1853. It originally consisted of a membership of 52 banks, and the system which it adopted was so simple, and yet so effective that it is difficult to imagine why its establishment should have been delayed for so long a time. Under the old system each bank was compelled to send to all other banks separately such of their checks as it might hold, for payment, and stood ready, in its turn, to pay cash to the other banks for such of its checks as they might have in their possession. When the clearing-house was established, however, a very different system was adopted, for, at a specified hour, each bank holding a membership in the association sent one of its clerks to the general office with all the checks that it held for collection. Here they were assorted, and the sum total of the checks held by each was compared with the sum total of the checks presented against it. If the result showed a balance in favor of the other banks, each bank paid to the clearing-house a sum equal to the amount due whereas, if the balance stood in favor of the bank, the clearing-house promptly drew its check for that amount. Thus, transactions that several clerks and messengers could not have completed within many hours were finished in a comparatively short space of time.

It was not only as a matter of convenience that the new clearing-house association made its influence felt, however, for its effect was beneficial both in the matter of economizing currency and in giving security to the great banking interests of the country. It is only necessary to remember that the clearing-house transactions often involve daily exchanges of more than $2,000,000 for one to realize what a tremendous amount of idle money would be required to transact this aggregate of business under the old system of separate clearance payments. Under the new clearance system, with its convenient method of balances, this business is transacted with the use of not more than four per cent. of the total amount of currency involved. Moreover, this system is not only an assurance of protection to its members in the matter of individual transactions, but it has, by its more extended operations of issuing loan certificates at critical times, proved a great bulwark of safety to the entire banking world. During these years the average daily exchanges of the clearing-house were $105,964,277, and the average daily balances, $3,939,265.

The New York Clearing House Association consists of 54 members, 53 of the members being representative banks, and the fifty-fourth member the assistant treasurer of the United States stationed at the sub-treasury in New York City. In addition to these active members, all other New York banks and trust companies are permitted to clear through the institutions which hold membership in the association. According to the last annual report, the transactions of the New York Clearing House for the year ending 30 Sept. 1905, were as follows: Total transactions, $95,833,194,343.80; average daily transactions, $315,240,770.86; total balances for the year, $3,953,875,974.80; average daily balances, $13,006,170.97. The total transactions of the association since its organization in 1853 have attained the almost incalculable aggregate of $1,657,547,640,106.75. As the advantages of such a system were too great to escape recognition other cities followed New York's example, and the exchange of the clearing houses of the country for 1905 aggregated $140,501,841,957.

No sketch of the history of the banking interests of the United States would be complete without a more or less detailed reference to the two disastrous periods that are now remembered as the panics of 1853 and 1873. Overspeculation, which was the cause of the former, had been going on for some time and the most conservative minds in the financial world had begun to look with considerable dread into the future, when the storm suddenly broke, on 24 August, when the Ohio Life

and Trust Company announced its suspension with liabilities in excess of $7,000,000. As the result of that failure the Philadelphia banks were compelled to suspend on 25–26 September, and this general suspension extended through Virginia, Maryland, the District of Columbia and even into Rhode Island. In New York the spirit of distrust became so general that runs on all the banks threatened most serious consequences, and, on 14 October, to prevent the utter demoralization of the banking system, the State legislature passed an act authorizing the suspension of specie payment for a term of one year. As the result the banks closed their doors, but the trouble was so largely a temporary one that the city banks were able to resume business again on 24 December. In New England, the panic which had first been felt chiefly in Rhode Island, rapidly extended until it finally became general throughout the entire section of the country. The banks not only suspended, but factories and large workshops shut down. In fact, in some places it was found necessary to call upon the State troops that they might be in readiness to put down the riots that were threatened by the vast army of hungry workingmen. Fortunately for the individual as well as for the nation the panic was of brief duration. By the beginning of 1854, business had renewed its activities and the banks had resumed operations, but, brief as the struggle was, it resulted in no less than 5,123 failures, with total liabilities amounting to $291,750,000. The next few years, however, saw a return to conditions that were not so foreign to the old time prosperity, and, in 1860, just one year prior to the long suspension of specie payment which was the direct result of conditions due to the war, there were in the United States no less than 1,562 banks, with an aggregate capital of $422,000,000, a circulation of about $207,000,000, deposits of $254,000,000, and specie in hand to the amount of more than $83,500,000.

The four years during which the war was in progress gave the banks of the country an opportunity to give unquestionable proof of their loyalty and patriotism, and yet the story of these times, with the Government's issues of its "legal tenders," is more properly a matter of discussion under the head of national finance. (See BANKS, NATIONAL.) Thus, the national banking law, the legislative enactment which regulates the operation of banks to-day, was passed 3 June 1864. Simple as its provisions were, they were drafted with such a clear view as to the security of the banking system, that little reason for dissatisfaction has been found with them. According to these provisions, the establishment of a bank requires the association of not less than five persons, and a fully paid-up capital. To secure its notes of issue it is compelled to hold the Government's pledge in the form of United States bonds, on which the comptroller of the currency authorizes it to circulate such notes to an amount equal to the par value of the securities not exceeding the authorized capital stock. Wise and secure as these conditions were, they would have been of little value in improving the currency situation if the State banks had been permitted to continue to issue their notes under the system that had existed since 1836. To meet this difficulty, therefore, Congress passed a law placing a prohibitive tax of 10 per cent. on the circulating notes of the State banks.

Realizing that the circulation of their notes would be impossible under the new conditions, many of the old State banks changed their organization to meet the requirements of the new national bank law, and, at the close of the war, there were not more than 500 of these institutions that had neither complied with the provisions of the new statutes nor gone out of existence. Those that remained continued to do what they are still doing. They transacted a general banking business of loan, discount and deposit, and left the circulation of notes to the national banks. At the time of the institution of the national banking system, however, it was specified that the comptroller of the currency should not permit the total circulation of the country to exceed $300,000,000. As more and more banks became established, however, the demand for a larger circulation became so insistent that Congress was at last compelled to take recognition of it by making an extra issue of $54,000,000. This was also almost immediately taken up.

The next critical period in the financial history of the United States was the disastrous panic of 1873. Serious as this ordeal was, however, it was not entirely unanticipated, for it was almost inevitable that the nation should pass through such a trying period in its transition from the season of inflation resulting from the great war loans to the normal basis of more peaceful times.

In 1875, Congress again resumed its serious consideration of the financial question, and, as the result of its discussions, several important reforms were instituted. One act removed all restrictions upon the total amount of notes which might be issued by the national banks. Another ordered the resumption of specie payment, which had been suspended since the beginning of the war, and this resumption, which, as it was decreed, took place 1 Jan. 1879, was accomplished without the slightest disturbance of business conditions, a fact which redounds greatly to the credit of America as a nation. From the day when Congress withdrew its restriction upon circulation the number of national banks have increased steadily from year to year. In 1875, there were 2,047 banks in the country, with a total capital of $497,864,833, and an aggregate surplus of $134,123,649. By 1885, only 10 years later, the number of banks had increased to 2,665, while their capital amounted to $524,599,602, and their total surplus to $146,903,495, making an increase of 618 banks, a total gain of $26,734,769 in capital, and an increase of $12,779,846 in the matter of surplus. Even such an increase did not meet the requirements of the ever-growing and prosperous country. Steadily, therefore, the work of the national banks widened, until, at last, in 1905, the report of the comptroller of the currency showed that there were no less than 5,757, such banks in the country, with an aggregate

capital of $799,870,229, a total surplus of $417,757,591, and undivided profits amounting to $202,536,366. Total resources, $7,472,350,878. Loans and discounts, $4,028,414,785. See UNITED STATES — FINANCES OF THE, 1801–1903.

Of course, in the meantime, the country has passed through another period of business depression and financial stringency. Coming more gradually than such crises usually come, it made itself most generally felt about 1892, and, for several years, it continued to exert its baneful influence more persistently than had been the case during any previous period of commercial misfortune. Although there was no actual panic there was a time when the nation stood perilously near the verge of disaster, and, while this condition of affairs was largely the effect of lack of confidence on behalf of the people it operated so conclusively as a check upon business enterprise, that its industrial reactions, which affected all classes, was the means of causing much suffering in all parts of the land. For the first time since the close of the Civil War the money broker reappeared to take his profits in the premiums he placed upon all sorts of currency, for the banks, having all too little money, were compelled to transact their business largely by means of certified checks.

One result of this hoarding of the nation's money was seen in the runs upon the institutions for savings. In the West these became so frequent, and were usually so persistent, that many of the perfectly solvent savings banks, being unable to realize upon their securities quickly enough to save themselves, were compelled to go to the wall. In New York, when the troubles became so threatening that it was impossible to judge how long it would be before the storm would break in an excited mob of depositors all eager to recover their savings, the bank officials held a hurried conference at which they determined that their only hope lay in the law that permitted them to refuse to pay an account except upon three months' previous notice. As they did take advantage of this clause, they succeeded in averting the disaster.

However important a factor the savings bank has become it is the national bank that has been the foundation of America's financial prosperity. During the past 30 years its stimulating influence has extended to almost every town and hamlet in which business is transacted. Well-organized, and carefully supervised, its uniform system of banking has made it of as great importance to the individual as it is to the Government. In fact, if any argument was needed to testify to the solvency of the system, it would only be necessary to remember that, since the establishment of the system, only 439 failures have occurred in a total of 7,966 banks that have been organized. See BANKING INSTITUTIONS, THE EXAMINATION OF.

Among the banks proper the State bank still holds an important position. At the close of the fiscal year, 1904–5, there were in the United States, according to the report of the Treasury Department, no less than 7,794 State banks, while, at this time, their aggregate resources were $3,190,911,378; their capital was $379,756,040; their surplus was $154,439,841; their undivided profits were $63,164,608; their aggregate deposits were $2,365,209,630, and their loans and discounts were $1,906,914,878, an amount which included the sum of $251,814,768, which represented the loans on real estate and collateral securities.

According to the Treasury report for 1904–5 the savings banks in existence numbered 1,237. Their total resources were $3,368,279,857; capital stock, $26,191,294; surplus, $197,582,867; undivided profits, $35,708,852; their aggregate deposits, $3,093,077,357, while the aggregate of their loans was $1,534,114,618, of which sum all but a very small amount was secured by real estate.

In 1905 there were 1,028 private banks in operation throughout the country. At this time their total resources were $165,233,295; capital stock, $22,518,193; surplus, $6,872,918; undivided profits, $2,958,278; their individual deposits were $127,937,098, and their loans and discounts were $107,098,805.

The number of loan and trust companies in existence at the close of this fiscal year, 1904–5, was 683. In spite of the fact that this is the smallest branch of the banking system, considered from a numerical point of view, the total resources of these institutions showed an aggregate of $2,865,976,479; capital stock, $243,133,622; their surplus was $281,289,339; undivided profits, $82,226,383; their loans and discounts amounted to $1,549,633,063, of which sum only $144,394,593 was on real estate, and their total deposits were $1,980,856,737.

From this array of figures it may easily be computed that there were no less than 16,499 banks of all descriptions engaged in business operations throughout the United States in 1905. The total amount of their capital was $1,471,469,378; their surplus amounted to $1,057,942,556, and undivided profits, $386,594,467, certainly a record of a stupendous achievement when we remember that it was not more than 125 years ago that the American banking system had its origin in a little Philadelphia bank which Robert Morris established upon a capital of only $400,000. See BANK BILLS; BANKS AND BANKING; FINANCE; TRUST COMPANIES; COINAGE; MONEY; MONETARY SYSTEMS OF THE WORLD; CANADA, FINANCIAL SYSTEM.

The grand aggregate of resources of all these banks reached the stupendous sum of $17,062,751,887; the individual deposits, $11,387,762,535, and loans and discounts, $9,126,176,149.

LEVI PARSONS MORTON.

Banks, Savings, in their inception, were primarily benevolent institutions, organized for the benefit of the working, thrifty citizen, who desirous of safeguarding the future of himself, and of those dependent upon him, saved small sums from his daily or weekly earnings; commercial and financial banks could not and would not attend to these small accounts, and therefore, the lawmakers, urged by public-spirited citizens, incorporated institutions, wherein the savings of the frugal-minded, industrious and thrifty, whose savings were too small to invest

in public or private securities, or who were not educated to make such investments, could be deposited with absolute safety, and at the same time earn some interest for them.

They may rightly be considered as a benevolence from the State, who thus endeavors to protect itself against the carelessness of its citizens, and to minimize mendicity, destitution, and pauperism, by offering to its people safe depositaries for their surplus earnings; the theory is that many will prefer independence from honest industry to beggarly dependence, the result of idleness or self-indulgence, and that the poor should be helped to help themselves, and to receive the reward for their industry and self-denial. To further foster this spirit, the savings banks are in many communities practically freed from taxation, in the same manner as churches, schools, hospitals, etc.; this enables them to return to their depositors all their earnings, save only the necessary expenses of conducting the business. Savings institutions are the outgrowth of a better social structure, making for order, temperance, virtue, industry, and thrift, as well as upholding public credit and fostering good citizenship; they create self-respect and independence, and may well be considered as among the greatest civilized forces working for the betterment of the condition of mankind.

Savings banks, however, are by no means charitable institutions. He who by careful living has a surplus, however small, over and above his daily needs, is in no sense a subject for charity; as a matter of fact, he is a small capitalist; he, together with many others, by depositing their savings in the savings banks, not only help themselves and encourage thrift in others, but these savings, amounting in the aggregate to enormous sums, instead of being locked up and hidden away, as in the past, are employed to further public and private enterprises, furnishing capital for building waterworks, railroads, State and city and private institutions, and thus this money finds its way back into the pockets of the laborer and mechanic, in the shape of work and wages, a true endless chain.

They are of comparatively modern origin, and it is only towards the end of the eighteenth century that we find any mention of them. Small beginnings were made in 1778 in Hamburg, Germany, and 1787 in Berne, Switzerland; these associations, however, simply cared for the spare cash of servants, mechanics, and laborers, and as a rule did not allow withdrawals, but granted annuities; being different from the English idea of savings banks. In England the matter was suggested, it is said, by Jeremy Bentham, in 1797, in his system of frugality banks, but the first known attempt in that direction was made in 1798 by the Rev. Joseph Smith of Wendover, who offered his parishioners to take care of their savings during the summer months and to repay them at Christmas with a bounty of one third additional; about the same time the "Friendly Society for the Benefit of Women and Children" was established at Tottenham High Cross, by Mrs. Priscilla Wakefield, and this society became regularly organized in 1804; Malthus also suggested, in 1803, the idea of county banks for the laboring classes. The first regular organization brought before the public was in 1810, when the Rev. Henry Dunkin of Ruthwell, Dumfriesshire, Scotland, started a self-sustaining institution, receiving deposits from the general public; during the first year of this "Parish Bank" the receipts amounted to £151, and in four years increased to £922. In 1814 the Edinburgh Savings Bank was established on the basis of Mr. Dunkin's plan. In London the first savings bank was opened in 1816 and was recognized by Act of Parliament in 1817.

Generally speaking it may be said that because of the fact that the paternal governments of Europe have large functions, thereby exerting a powerful influence in the economic life of the nation, and also partly owing to the lack of initiative in private benevolent enterprises, savings banks were started there as national enterprises, usually managed through the post-office department; the investments of such banks being mainly confined to government securities.

In the United States the functions of the government are more limited, and are usually restricted to formulating general legislation, or granting charters to savings institutions under the laws of the different States, and also exerting some supervision over them, by means of periodical examinations by the State bank superintendent or commissioner. Under our system of government we are apt to consider that our citizens are fully able to attend themselves to their banking business, in the same manner as the banks of deposit and discount, and it is a good American practice, that does not allow the State to interfere with the private business of its citizens, and restricts it to its own functions, as well defined in the Constitution. In the United States there is no permanent or perpetual debt, thus making this form of investment impracticable, as it certainly would be injudicious for our savings banks, who are usually looked upon as local institutions, the money which they receive on deposit being loaned out, whenever practicable, in the vicinity of the bank itself. We may trace the first savings bank in the United States to the organization in 1816 of the Philadelphia Savings Fund Society, in Philadelphia, Pa., a private association which was afterwards incorporated by the legislature of Pennsylvania in 1819. The Provident Institution for Savings in the town of Boston, Mass., was incorporated in 1816, and the Savings Bank of Baltimore, Md., in 1818. In New York the first organized savings bank was the Bank for Savings. Efforts had been made for several years by public-spirited citizens of that city, to get a charter from the legislature for such bank, acting on a suggestion received from Patrick Colquhoun, a magistrate in London, by his correspondent in New York, Thomas Eddy; but the then existing hostility to banks rendered this very difficult, and it was not without much work and considerable delay that at last, in 1819, a bill incorporating the Bank for Savings was passed by the legislature and approved by the council of revision. The organizers named in the certificate were nearly all members of the Society for the Prevention of Pauperism, founded in 1817. The trustees (three in rotation) attended for one month each, as a committee, doing the work of the bank; they received no compensation for their services, and were restricted in investing their deposits to government securities and public stocks, issued under the laws

of the United States and of this State. Since then many savings institutions have been organized both in New York and in the other States of the Union.

The primary savings bank being wholly philanthropic, the services of the trustees are usually gratuitous, and on this basis there have been built, in the Eastern States of the United States, a large number of flourishing institutions, answering perfectly to the demands that gave them birth. Criticisms have been made at times, and were echoed in the legislature, disapproving of the requirement of the gratuity of the trustee's services, and arguing that men are sure to become careless in their supervision when not paid for their services; partly because of this contention, the plan of mutual savings banks has not been adopted in the Western and Southern States, where the savings bank business is done by financial institutions furnishing their capital and surplus as a guarantee for the repayment of deposits, and where the directors and stockholders are directly and financially interested in the success of the bank. Another reason to be considered also, was that conditions in these States differ vastly from those existing in the Eastern States. It was generally believed that purely mutual savings banks would not receive sufficient support, and could not succeed in the more sparsely settled parts of our country, and therefore they were instituted as adjuncts, or departments, of regular commercial banks of deposit. A few large and successful mutual savings banks, based on the eastern idea, and flourishing in the Western and far Western States, seem, however, to prove that this reason does not always apply. There is no doubt that mutual savings institutions, protected by wise legislation, strictly restricted as to first class investments and practically freed from taxation, are as safe depositaries of the savings of the nation, as may well be devised; and no institutions created with that object in view can possibly be made too safe. A proposal for postal savings banks has been frequently before the public, but has never met with success. The main arguments against them consist in the difficulty which would be found in investing these large amounts by a body of constantly changing officeholders, and also that the functions of the State should not be increased, but rather diminished.

The average rate of interest paid to savings bank depositors in the United States is about 3½ per cent per annum.

In England the savings banks are both governmental and trustee banks. The trustee banks are based on a plan somewhat similar to our mutual banks in the United States. They have some 2,300,000 depositors, with about $300,000,000, to their credit. The governmental banks are called postal savings banks. Deposits and withdrawals are made through the numerous post-offices in Great Britain, and the deposits, as is mainly the case with trustee banks, are invested in government securities through the commissioners of the public debt. These post-office savings banks have about 8,800,000 depositors, with aggregate deposits of about $700,000,000. The interest paid is about 2¾ per cent per annum.

A short summary of the law of the State of New York, which is considered by many the best savings bank law in the United States, is as follows:

Trustees.— Thirteen or more, to receive no remuneration as such, nor to borrow money from the bank.

Investments.— Government bonds, bonds of States not having defaulted for 10 years, municipal bonds in New York State and several other named cities, railroad bonds as named, bonds and mortgages on real estate in the State for not over 65 per cent of deposits, nor for above 60 per cent of value, if improved, or 40 per cent if unimproved.

No *loans* on personal security.

To hold no *real property,* except banking house, and that acquired under foreclosure, which is to be sold within five years.

Deposits limited to $3,000 for each depositor; *interest* not over 5 per cent per annum; *surplus* fund, not over 15 per cent of deposits; *examination* every two years by bank superintendent.

Savings bank statistics form a very uncertain basis for comparisons and for drawing conclusions, as conditions differ vastly in different countries. In the United States, in addition to the deposits in the savings banks, there is a large accumulation of savings in the life insurance companies ($2,000,000,000), in the building and loan associations ($600,000,000), and in school savings banks ($500,000), not to speak of the savings invested in homesteads and land. In England, where landlordism prevails, nearly all the savings are in the savings banks and life insurance companies. In France, where the land is divided into small holdings, some of the savings of its people are in the savings banks, but they are mainly invested in stocks and in the irredeemable government bonds held by its people direct. In Germany and Switzerland, many communes and cantons have established municipal institutions, doing much the same work as our own savings banks in the United States. In Russia the government takes charge of all savings. In Austria both government postal banks and private banks are organized. In Sweden the post-office banks invest their funds in government bonds, bank stocks, and municipal public stocks.

The following table shows the number of depositors and amount of deposits in savings banks in the different countries of the world, where statistics are obtainable.

Countries	Number of Depositors	Total deposits
Austria-Hungary	6,663,822	$1,309,752,448
British Colonies	2,782,572	330,858,520
Belgium	2,088,448	141,851,419
Denmark	1,203,120	236,170,057
France	11,298,474	847,224,910
Germany	15,432,211	2,273,406,226
Great Britain	11,093,469	966,854,253
Holland	1,330,275	72,738,817
Italy	6,740,138	482,263,472
Japan	7,467,452	40,887,186
Norway	718,823	89,633,481
Roumania	145,507	7,426,031
Russia	5,177,501	466,159,229
Sweden	1,892,586	151,480,442
Switzerland	1,300,000	193,000,000
United States	7,305,433	3,060,178,611
Total	82,639,831	$10,669,885,102

The above figures show average deposits in the savings banks in the world of $101.01 for

each depositor, or $11.00 per capita. The deposits in the United States average $418.89 for each depositor, or $37.38 per capita of population.

The following table shows the growth of the savings banks in the United States:

Year	Number of Depositors	Total deposits
1820	8,635	$1,138,576
1830	38,035	6,973,304
1840	78,701	14,051,520
1850	251,354	43,431,130
1860	693,870	149,277,504
1870	1,630,846	549,874,358
1880	2,335,582	819,106,973
1890	4,258 893	1,524,844,506
1900	6,107,083	2,449,547,885
1904	7,305,443	3,060,178,611

In several States of the Union associations of savings banks have been formed for mutual benefit, and for the purpose of watching over proposed legislation in regard to savings banks so as to protect the interests of their depositors. In 1901 a national union of savings banks was organized as the savings bank section of the American Bankers' Association. This section includes in its membership a majority of the savings banks in the United States, and conventions are held yearly where members from all parts of the United States meet to discuss the many subjects of particular interest to savings banks and to their depositors.

WILLIAM HANHART,
Secretary "Savings Bank Section" The American Bankers' Association, New York.

Banks, United States National. The national Bank of the United States owes its existence to the necessities that were occasioned as the direct result of the outbreak of the Civil War. Prior to 1861 the paper currency of the country had been furnished by some 1,600 private corporations, each organized under its respective State laws. When Congress met in extraordinary session on 4 July 1861, it was confronted by a serious financial situation. With estimates showing a probable expenditure of $1,000,000 a day, the treasury was empty and the nation was already deeply in debt. At the suggestion of Secretary Chase, therefore, the government was empowered to raise $320,000,000, all but $80,000,000 of which should be by loan, and, in anticipation of the revenue, to issue $50,000,000 of treasury notes, redeemable on demand. At the invitation of Secretary Chase the banks in the larger cities soon negotiated the requisite loan, but, while this relieved the temporary necessities of the treasury, the secretary realized that a safer financial policy must be adopted if the nation was to remain upon a secure foundation. When Congress reassembled in December, therefore, Mr. Chase was prepared to suggest a plan to meet these requirements. He explained that while the ordinary revenues of the country might be sufficient to meet the ordinary expenditures, for the extraordinary expenses of the war it was necessary to depend upon loans, and he suggested that the time had come when the government might properly claim a part, at least, of the advantage of the paper circulation then constituting a loan without interest from the people to the banks. He believed that the best way to accomplish this result was to provide a national currency, to be issued by the banks but secured by the pledge of United States bonds.

Before Congress could consider the secretary's recommendations the suspension of specie payment, 28 Dec. 1861, completely changed the aspect of the situation. To provide for the pressing needs for cash, Congress was compelled to authorize the issue of more demand notes and so matters continued until December 1862, by which time the war had reached such a magnitude as to exhaust even the enormous resources provided by Congress. The disbursements in November had amounted to nearly two million dollars a day, while unpaid requisitions had reached the extent of $46,000,000, and the annual statement of receipts and expenditures showed a deficit of $277,000,000 to be provided for. To meet this situation Secretary Chase recommended an increase in the amount authorized to be borrowed on the last 5–20 bonds, but, in order to create a market for these bonds, he again advised the creation of a series of banking associations under a national law that should require them to secure their circulation by a deposit of government securities. Although strongly advocated and introduced in a bill by Mr. Hooper, 7 Jan. 1863, the suggestion met with so little favor that the bill was adversely reported by the Committee on Ways and Means, but on 25 January, after President Lincoln had sent a special message to the House warning Congress that its present financial policy would soon produce disastrous consequences, Senator Sherman introduced another bill providing for a national currency. This measure differed somewhat from Mr. Hooper's bill, which had failed in the committee room, and, as some of the features which had proved objectionable in the former measure had been eliminated in the Senate bill, it met with less opposition, although it was so closely contested that it passed the Senate, 12 Feb. 1863, by a vote of 23 to 21 only. The House concurred in its passage on the 20th by a vote of 78 to 64, and, on the 25th, the measure received the signature of the President, and it was this act which has been productive of the magnificent national bank system of the United States of to-day. See Sumner, 'History of American Currency'; Richardson, 'The National Banks'; Bolles, 'Financial History of the United States.'

Bannatyne Club, a literary club, named after George Bannatyne, the Scotch literateur, founded in 1823 by Sir Walter Scott, its purpose being to publish works on Scottish history and literature. It was dissolved in 1859. The society when founded had 31 members, but when dissolved there were 100, the membership being limited to that number.

Ban'neker, Benjamin, American negro mathematician: b. Maryland 9 Nov. 1731; d. 1806. At the age of 50 he began the study of mathematics for astronomical purposes. He published annually after 1792 an almanac devised by himself, and aided in determining the boundaries of the District of Columbia.

Ban'neret, an abbreviation of knight banneret; a member of an ancient order of knighthood which had the privilege of leading their retainers to battle under their own flag. A banneret was entitled to display a banner instead of a pennon. They ranked as the next

order below the Knights of the Garter, only a few official dignitaries intervening. This was not, however, unless they were created by the king on the field of battle, else they ranked after baronets. The order is now extinct, the last banneret created having been at the battle of Edgehill, in 1642, for his gallantry in rescuing the standard of Charles I.

Bannock, a cake once much eaten in Scotland. It was made of oatmeal, barley-meal, or peasemeal baked on an iron plate or griddle over the fire. From a supposed resemblance the turbot is sometimes called in Scotland the bannock-fluke.

Ban'nock. See BANAK.

Ban'nockburn, Scotland, a village in Stirlingshire, two miles southeast of Stirling, famous for the decisive battle fought near it, 24 June 1314, between King Robert Bruce of Scotland and Edward II. of England, in which the English, though greatly superior in numbers and equipment, were defeated. The Scots owed their signal success partly to their position and partly to the use of covered pits which rendered the English cavalry useless. The Borestone, where Bruce is said to have planted his standard, is still shown near a flagstaff erected in 1870. The village has manufactures of woolens, such as tartans, carpets, etc. Pop. (1900) 2,600.

Banns, the announcement of intended marriage, requiring the hearers to make known any cause why the parties should not be united in matrimony. By the publication of these banns is meant the legal proclamation or notification within the parish, district, or chapelry, of the names and descriptions of the persons who intend to be there married; the object being to secure public knowledge of intended marriages, and that all who have objections to the marriage may be enabled to state them in time. If the bridegroom live in a different parish from the bride, the banns must be proclaimed also in that parish, and a certificate of such proclamation must be produced before the celebration of the marriage. According to the old English canon law, the publication of banns might be made on holidays; but a change was made to Sundays by Lord Hardwicke's Marriage Act in 1753, and although that act was afterward superseded by the 4 Geo. IV. chap. 76, the regulation as to Sundays has been since continued. Seven days' notice at least must be given to the clergyman before publication of banns. Banns were customary in various places before they were prescribed by the entire Church in the Fourth Council of Lateran. The Council of Trent ordered pastors to publish them at the principal mass in the parish church, or churches, of the parties, on three successive Sundays or festivals. This publication should be made within two months preceding the marriage. For grave reasons the bishop can dispense from this obligation. By the English Prayer Book the announcement is required to be made in the words of the rubric on each of the three Sundays preceding the ceremony. If objections are offered by anyone present, the clergyman cannot proceed further. Except in the Roman Catholic Church the custom of thus publishing the banns of marriage is practically obsolete in the United States.

Banquets. It was the famous Mr. Boswell who first defined man as a cooking animal, and yet, appropriate as the definition still is, neither mythology nor tradition offer any clue to aid the student in discovering when it was that the human animal first learned to cook. Of course, it is highly improbable that this secret was known to prehistoric man. Instead of knowing how to cook he undoubtedly ate his food raw, washing it down with pure cold water from the springs and brooks, and many years must have elapsed before he made the surprising discovery that the foods that satisfied his hunger could be vastly improved in taste if subjected to the influence of heat. All this, however, is little more than mere surmise for our only knowledge regarding the customs of eating in vogue during the remote past has been obtained from the relics unearthed by archæology. On walls now ruined and decayed the hand of the ancient painter and sculptor left a record of the customs of his time and from this source the student has been able to gather some little information regarding the gastronomic progress of the human race.

Such records, however valuable they may be in the absence of other facts, are vague and unsatisfactory at best, and so, turning to ancient literature, one finds that the earliest references to food preparation are contained in the Bible. In Genesis, when Abraham bade Sarah make ready three measures of fine meal that he might be prepared to entertain the angel, the student finds his first direct reference to breadstuffs, and, from that time, the Scriptures often make mention of some foods by means of which the reader may obtain a more or less correct idea of the slow stages by which this branch of the human race progressed from its habits of primitive simplicity to the stately banquets of King Solomon and the extravagant feasts of Belshazzar.

As our meagre records show that the art of feasting was practically contemporaneous with the Egyptians and the Hebrews it is not improbable that the latter race may have learned the secrets of good living from the former during the time of the captivity, for at the period when both Greek and Roman were still content with the simplest fare the Hebrews had been initiated into the pleasures of the table, a fact which explains the many quaint Biblical warnings against the sin of gluttony, as in Esdras, where it is said that "the faces of them that have used abstinence shall shine above the stars."

Among the ancient Jews all festive repasts were held toward the close of the day, after all matters of business had been concluded. If the feast was to be one of great ceremony guests were not only invited long before the occasion, but again, on the day and as near as possible to the hour appointed, servants were sent to their houses to deliver orally the second, or "express" invitation, which announced that the host was now prepared to receive his guests. As this "express" invitation was sent to none but those who had already declared their acceptance, honor and propriety required that they answer the summons at once and in person, a fact which explains and justifies the feelings of resentment which were entertained by the master of the house in the parable of the great supper, on which occasion, as will be remembered, each

person invited met the bearer of the "express" with a frivolous apology for his inability to be present at the feast to which he had already accepted an invitation.

Guests at Hebrew banquets were required to bring their cards of invitation and these were presented to servants stationed at the entrance door. Upon being admitted the guests were conducted to the receiving-room where water, oils and perfumes awaited them. If the host desired to exhibit a great mark of courtesy he provided each guest with a richly embroidered garment, light and showy and cut in a flowing fashion, which all were required to wear during the feast.

If the banquet was of a private character the master of the house presided, but on occasions of public festivity a governor of the feast was selected and it was his duty to see that the banquet was not only properly conducted but that the company present preserved at least a semblance to order. Appointment to this office was always regarded as a great honor, and, among the Greeks and Romans, the position was prized so highly that the choice of the individual to fill it was often decided by chance, as by the throw of the dice.

The positions of the guests at the tables were not fixed by inviolable rule. Sometimes they selected their own places, while, at other times, they were arranged by seniority of family, or even according to the whim of the host who might desire to assign the most distinguished guests to places near his own person. In the earliest days, as is shown by the habits of the ancient Israelites, guests sat cross-legged around a low table and the custom of reclining while eating was not introduced until about the last of the Old Testament days. At least, it was about this time that the Jews adopted this custom, as well as the habit of having but two thirds of the table spread with a cloth, the portion where the food was to stand being left bare. In ancient Egypt and Persia the tables were arranged along the sides of the room and guests faced the wall.

At this time such articles as spoons, knives and forks were unknown and those who ate obtained the morsel they desired by dipping their slices of bread in the dish before them, folding the piece of meat or other food substance within it by the use of the thumb and two fingers. Later centuries saw the invention of the spoon but many hundred years elapsed before any other substitute for the fingers was suggested. Naturally the hands became besmeared with grease but they were cleaned by being rubbed on slices of bread, kept for that purpose. This bread was then thrown to the dogs who waited beneath the tables for just such morsels from the feast. If the fingers became too badly soiled, however, servants appeared with water and assisted the guests to wash by pouring a stream over the hands into a basin.

When the party was a large one it was the custom for two persons to eat from one dish and the host often showed the height of hospitality by dipping his hand into his own dish, lifting a portion of the food, and offering sop to his guest. To decline such an attention was a breach of etiquette that stamped one as being extremely ill-bred. In order that the hands should be always clean from dirt, however, the rabbis enjoined the "first water" and the "last water," or the washing before and after eating, and, in the case of travelers at least, the "first water" included the washing of the feet. After the adoption of the reclining posture guests lay with their faces toward the table, the left arm resting upon a cushion and the feet stretched out behind, while during the progress of the banquet both head and feet were frequently sprinkled with perfume to overcome any unpleasant odor that might arise from too copious perspiration.

The foods served at these ancient banquets consisted of flesh, fish, fowl, melted butter, bread, honey and fruit, all of which were brought to the table at one time, the service being accomplished by the use of trays, the number and quality of the dishes varying under different circumstances. In ordinary cases the portion of each guest consisted of four or five dishes, but if the guest was a person of great distinction this portion was increased until the dishes became so numerous that they were piled one upon another, completely covering the table. All this food, which was usually prepared in liquid or with a sauce, as in a stew, had been cut into conveniently small pieces before it was served.

From the earliest days within the recollection of history sacrificial occasions have always included a banquet, however crude a festival it may have been, and it was the adoption of this custom that gave a religious as well as a social significance to so many of the Hebrew feasts. As the Lord's Supper of the Christians was derived from the Passover, so all the great religious festivals had, as their accompaniment, a domestic feast. On the occasion of the religious banquets, however, the wine was mixed according to rabbinical regulation, or with three parts water; four brief benedictions being pronounced over the cup before it was passed by the master of the feast.

The Greeks, like the Persians, began and ended their feasts with libations of wine, and some idea of the nature of an ancient Greek banquet may be obtained from the following curious account of a dinner given by Achilles in honor of Ulysses:

> He cast down a great fleshing block in the firelight, and laid thereon a sheep's back and a fat goat's and a great hog's chine, rich with fat. And Automedon held them for him while Achilles carved. Then he sliced well the meat, and pierced it through with spits. Then, when the fire was burned down and the flames waned, he scattered the embers and laid the spits thereupon, after he had sprinkled them with holy salt. Then when he had roasted the meat and apportioned it in platters, Patroklos took bread and dealt it forth in fair baskets, and Achilles dealt the meat; and he sate himself over against godlike Odysseus and bade his comrade Patroklos to sacrifice to the gods, so he cast the first fruits into the fire. Then they put their hands to the good cheer lying before them.

Later, of course, the Greeks became more delicate eaters and vied with the Romans as to the elaborate character of their feasts. Like the Egyptians and Hebrews they reclined at table and their sumptuous repasts were divided into two courses: the first consisting of fish and meat, accompanied by the vegetables and several hors d'œuvres or entrees, while the second course comprised the pastry, fruits and other kinds of dessert.

As soon as the regular meal was finished the tables were removed and the floor was cleaned of all fragments. Other tables were then brought in by the servants, tables covered with

salted cakes, cheeses and other foods provocative of thirst, as well as the great mixing bowls, the pitchers of water cooled in snow, and the jugs of unmixed wine, for the Greeks loved to drink heavily after eating, and as they drank, to an accompaniment of music, song and dances, young and handsome slaves garlanded their heads and breasts with twining vines and flowers, not, as has sometimes been said, as a sign of festivity, but because the garlands were supposed to cool the forehead and counteract the heady effect of the wines.

Like the Hebrews the Greeks obtained their first lessons in cookery from the Egyptians and they soon put them to good account. The Athenians were particularly apt pupils in the kitchen science and they finally came to excel the rest of Greece in gastronomic achievements just as the modern French excel the rest of Europe in this day. An excellent proof of this assertion is to be found in the circumstance that what is regarded as one of the most valuable of the lost works of antiquity is a didactic poem on gastronomy, written by Archestratus, the intimate friend of one of the sons of Pericles. «This great writer,» says Athenæus, «has traversed earth and sea to render himself acquainted with the best things which they produced. He did not, during his travels, inquire concerning the manners of nations, as to which it is useless to inform ourselves, since it is impossible to change them; but he entered the laboratories where the delicacies of the table were prepared, and he held intercourse with none but those who could advance his pleasure. His poem is a treasure of science, every verse is a precept.»

Among the great nations of ancient times the Romans were the last to learn the art of cookery. As late as the year 174 B.C. there were neither cooks nor public bakers in Rome, and the people were satisfied with and asked for nothing better than a kind of porridge made of pulse. This in addition to their vegetables and some leguminous fruits formed their principle articles of diet. The Asiatic wars, however, introduced the Romans to the luxuries of the table and, in a day as it were, Rome, discovering that it had a palate, went mad on the subject of gastronomy. Slaves who could cook, bake, or make sweets were brought to Rome in large numbers but, as every man of wealth was eager to purchase them, they brought the highest of prices.

As this was the dawning of the day of Rome's expansion it was not long before her agents began to supply her capital with dainties from all parts of the world. From the far East to the far West whatever seemed delicate of taste or that might help to tempt a nation of palates already craving a new flavor was brought to the cooks in the Roman kitchens. To improve the quality of his cuisine the Emperor Vitellius, one of the most enormous eaters the world has ever known, sent his legions to every part of the empire to shoot game for him, while entire fleets were employed in doing nothing but catching the fish that were to grace his table. In fact it seemed as if Rome, so long satisfied with the humblest of fare, could not find a sufficient variety of foods to gratify its desire for novelty.

Even as early as Cæsar's time, however, the Roman table was liberally provided with a variety of foods sufficient to satisfy almost any appetite. As an example of a feast given in those days one may take the following menu which was served at a pontifical banquet long before the advent of the golden days of Imperial Rome:

The first course, which was intended to merely whet the appetite, consisted of conger eels, oysters, two kinds of mussels, thrushes served on asparagus, fat fowls, a ragout of oysters and other shell fish, with black and white marrons. The second course included a variety of shell fish and other marine animals, becaficos, haunches of venison, a wild boar, and a pasty of becaficos and other birds. The third, and principal course, comprised the udder of swine, boar's head, a fricassee of fish, a fricassee of sow's udder, ducks of various kinds, roast fowl, with pastry and Picentine bread.

As the years passed Rome experienced no deterioration in its love for the good things of the table. In fact, on the other hand, this pontifical menu was really a meagre bill of fare as compared to those which were afterward prepared by the Roman cooks for the delectation of the later Cæsars. As an illustration the following description of a banquet in the time of Nero, which is taken from Dean Farrar's 'Darkness and Dawn,' is admitted by students to be a vivid but not exaggerated picture of a feast in the days of Imperial Rome. At this banquet, which was prepared under the directions of Otho, Nero entertained eight guests. The walls of the room «were inlaid with mother-of-pearl and slabs of ivory. . . . The table was of cedar-wood, and it sparkled with goblets of gold and silver. . . . among which were scattered amber cups. . . . Although it was winter, garlands of exotic roses were provided for every guest, and none but the most youthful and beautiful of Otho's slaves were permitted to wait upon them. The supper was no supper of Trimalchio, with its coarse and heavy gluttonies. . . . The oysters were from Richborough; the lampreys were from the fishponds of a senator who was said to have flung into them more than one slave who had offended him; the mullet came from Tauromenos; the milk cheese from Sarsina. There were two tiny dishes which represented the last and most extravagant devices of Roman gourmets, the one composed of the tongues of nightingales, the other of the brains of Samian peacocks and African flamingoes, of which the iridescent and crimson feathers adorned the silver plates on which they lay. Sea and land had been swept with mad prodigality to furnish every luxury. The wines were of the rarest vintages, and whereas four kinds of wine were thought extravagant in the days of Julius Cæsar, Otho set 80 different sorts before his guests. . . . Hot mushrooms alternated with bits of ice.» Perfumes were sprinkled on the hair and feet of the guests, and the amusements that were provided were dancing by Andalusian girls, dice and gambling. Offerings to the gods were not forgotten, however, and these were thrown into the hearth.

If this was a dainty repast, however, Rome was not always so dainty for the wealthy gourmands were not satisfied with eating well. They wanted to gluttonize, to eat of everything immoderately until they found it impossible to eat any more, when, by resorting to the ever-convenient feather, they were able to return to the

feast and stuff themselves once more to repletion. On such occasions the more distinguished the company, the earlier began the banquet and the later it lasted.

Nor did the Roman table ever go dry for the want of rare and choice wines. In Greece the juice of the grape was almost invariably mixed with water, but Rome wanted no dilution of its revelling. Wildly extravagant and prodigal in everything, the Romans made no exception in the case of their drink. The wines that they used were preserved in jars or bottles of baked clay, and, as they were prized in proportion to their age, each receptacle bore a label on which it was distinctly stated in what consulship the beverage had been made. Many of these wines came from Italy, the Campania being considered the best, but the wines of Greece were also there, side by side with all the drinks that time or money could gather from every part of the world.

The fact that civilization and cookery go hand in hand was never more strikingly illustrated than in the case of the ancient Britons, for, in the earlier days of their history their cuisine was marked by all the limitations of primitive simplicity. The Roman conquest, however, appears to have applied to the kitchens of the country as thoroughly as to the government, for as the Roman conquerors were unwilling to eat the crude culinary preparations of the native Briton they proceeded to teach the conquered how to cook for them. Then, too, at about the same time, the appearance of the German immigrants, with their own more wholesome cookery, was not without its good effect, and the transformation in Mme. Britannica's methods of cooking may be said to have been almost as wise as it was radical.

The centuries which succeeded the fall of the Roman Empire, and which comprised the greater part of the Middle Ages, was as dark a period for gastronomy as it was for all other arts. For a time it seemed as if man had forgotten how to cook; as if he had lost his taste for the well seasoned dishes which had once been his chief delight, and that he had no desire to get it back again. Even Charlemagne, who, according to his Capitularies, took a warm personal interest in his table, was a novice both in the art of cooking and in that of service, for his banquets were barbaric affairs composed of huge roasts of meat dripping from the spit, and other crude features that would have put the ancient Roman gourmets to the blush. Personally, too, the great Emperor of the West was extremely abstemious and seldom, even at dinner, permitted himself to be served with more than four dishes.

The reading of the description of Prince John's banquet in Sir Walter Scott's 'Ivanhoe' certainly gives the impression that the Normans, who appeared two or three centuries later, were justified in priding themselves upon their superior taste and discrimination in matters of eating, but even such flashes of light were but faint illuminations for so black a night for art as that of the dark ages.

Highly as the cuisine is esteemed to-day; idolized as it was before the fall of Rome and Greece called a halt upon civilization and placed a check upon progress, it seems somewhat strange that there was no one chronicler of affairs bright enough to detect the fact that the revival in the lost art of cookery had commenced. As the historians of those days dealt in facts, not in manners, however, it is impossible to state at just what period gastronomy began to be cultivated again, although, of course, it is well known that its revival, like the revival in learning, was brought about in Italy. According to the best authorities, however, it was the merchant-princes of Florence who made the first attempt to improve the cuisine of the country and their experiments met with such success that their efforts were greeted with the most heartfelt encouragement by travelers from foreign countries who were invited to sit at their tables. It was to the Italian cuisine, in fact, that the French owed their instructions in the gastronomic art, for when Catherine de Medicis returned to Paris she carried several professors of the new cookery in her train. The effect of their importation was almost immediately noticeable. They improved the *pot-au-feu;* they expounded a new theory of taste; they expatiated upon the value of sauces, but, and this was more to the purpose so far as the progress of civilization was concerned, they introduced the art of making ices. Even the 16th century Montaigne, whose life was certainly cast in pleasant places, among the people who composed the best French society, was unable to appreciate the estimate that the Italian cooks of that day had so properly put upon their vocation. In one of his contemporaneous, if not somewhat reminiscent studies, he says:

> I have seen amongst us one of those artists who had been in the service of Cardinal Caraffa. He discoursed to me of this science de gueule with a gravity and a magisterial air, as if he was speaking of some weighty point of theology. He expounded to me a difference of appetites: that which one has fasting; that which one has after the second or third course; the methods now of satisfying and then of exciting and piquing it; the police of sauces, first in general, and next in particularising the qualities of the ingredients and their effects; the differences of salads according to their seasons; that which should be warmed, that which should be served cold, with the mode of adorning and embellishing them to make them pleasant to the view. He then entered on the order of the service, full of elevated and important considerations —
>
> "Nec minimo sane discrimine refert
> Quo gestu lepores et quo gallina secetur."
>
> And all this expressed in rich and magnificent terms, in those very terms, indeed, which one employs in treating of the government of an empire.— I well remember my man.

The period which intervened between the arrival of Catherine de Medicis from Italy and the accession of Louis XIV. is one concerning which there is practically no authentic culinary record, although there is not the slightest reason to doubt that prodigious advances were made by the gastronomic art during that time. In fact, one has but to refer to one of the menus from the table of Louis XIV. to realize that cookery had ceased to be an experiment, and it is necessary to go but a step further and compare the foods of Paris in Louis' time with those in use in other parts of the world, to realize the progress that had been made by the French cooks by the middle of the 16th century. In Paris, for example, the foods were not dissimilar to those of our own day, to which the following menu of a dinner which was served to Emperor Charles V., by the city of Halle, would certainly be a contrast:

> (1) Raisins in malt flour; (2) fried eggs; (3) pancakes; (4) steamed carrots; (5) fried slices of bread;

(6) a covered porridge; (7) a high pasty; (8) a pea-soup with marrow, covered richly with peas and eggs; (9) yellow codfish boiled in butter; (10) carps, boiled; (11) fried fish, with bitter oranges, spiced; (12) sweet pikes; (13) pulverized kernels, with almonds (14) maize in almonds' milk; (15) fried fish with small olives; (16) cakes; (17) pears and confect.

And during this time England, too, had made some little progress in the improvement of its cuisine, although Henry VIII. was one of the first monarchs who exhibited any liberality in rewarding originality in cookery. Henry, however, seemed unable to do enough for those who ministered to the gratification of his appetite, and on one occasion, he was so much delighted with the flavor of a new pudding that he presented a manor to its inventor.

From the early days when the housewives of Briton had adopted a cuisine which may quite properly be termed an amalgamation of German and Roman cookery England had maintained a position of her own in the world of gastronomy. By no means as ostentatious as the ancient disciples of the art; less dainty, perhaps, than the more modern disciples in the various European countries, their school of the kitchen was so largely their own that it is not strange that Cardinal Campeggio, one of the legates charged to treat with Henry VIII. concerning his divorce from Catherine should have been requested to draw up a report on the state of English cookery as compared with that of Italy and France, by the express desire and for the especial use of his Holiness the Pope.

There are certain historical documents connected with the Seymour family still on file in London, which throw a most interesting light upon the culinary customs in vogue in England during the reign of the Eighth Henry. They show, for example, the manner in which he was entertained at Wulfhall on the occasion of his marriage to Jane Seymour. The facts, presented in a paper prepared by the Duchess of Somerset, are as follows:

The king, with his whole household and nobility, arrived at Wulfhall on Saturday, 9 Aug. 1539. They remained Sunday, Monday, and Tuesday. How or where so many were lodged does not appear; but "covers," as we should call them, "messes," as the book calls them, were laid for two hundred the first day. There are only two meals a day accounted for, and it appears that on Saturdays, as well as on Fridays, no meat was eaten, abstinence from flesh on those days having been ordered by a Royal proclamation, not only for health and discipline, but for the benefit of the commonwealth and the profit of the fishing-trade. The king's supper on his arrival, therefore, consisted only of fish.

Country places in Wiltshire must have been better supplied with fish than they are now, for the bill of fare included pikes, gills, salmon, tenches, lobsters, bream, plaice, trouts, congers, carps, roach, eels, potted sea-fish and salmon pasties, a sack of oysters, salt haberdine (which was cod-fish salted at Aberdeen), soles, and whitings.

The next day being Sunday, there were messes for four hundred, and the provisions amounted to 6 oxen, 2 muttons, 12 meals, 5 cygnets, 21 great capons, 7 good capons, 10 Kentish capons, 3 dozen and 6 coarse capons, 70 pullets, 91 chickens, 38 quails, 9 mews, 6 grets, 2 shields of brawn, 7 swans, 2 cranes, 2 storks, 3 pheasants, 40 partridges, 2 peachicks, 21 snipe, besides larks and brews — whatever they were.

It is scarcely necessary to trace the history of the banquet — which is, of course, but another name for the history of eating — with more close attention to detail. In contrasting the banquets of other days with those of to-day, however, one is struck by the fact that the modern peoples have also made some considerable improvement in the manner of eating and drinking, for one has but to turn to the menus of meals served at the beginning of the 19th century to find that dinners were not infrequently burdened by 20 or more entrees.

In the last century before the Christian era a stoic, Posidonius of Rhodes, in discussing the methods of cookery, took advantage of the opportunity to preach simplicity. He insisted that man, who had been blessed with good teeth, glands, and secretions, a tongue and the usual apparatus for digestion was independent of the cuisine, and this ancient pagan idea that the object of all repasts should be to take away the desire of eating and to maintain health and vigor has become more acceptable to thoughtful people during the past century. To-day our private banquets at least are simplicity itself when compared with those of even a century ago, and while their somewhat monotonous dearth of any entertainment except that of eating and drinking, with occasional music, has recently resulted in a sort of mania for the odd and eccentric, it is so obvious that these banquets are based upon the old desire for notoriety, the wish to dazzle which has inspired so many of the world's great feasts since the days of King Solomon's entertainment of the Queen of Sheba, that no particular attention is paid to such purile attempts to provide a novelty.

To obtain a correct idea of the modern banquet, however, the public banquet conceived and executed in the most perfect taste, it is only necessary to recall the dinner recently given at Compeigne by President Loubet of France in honor of the Czar and Czarina of Russia. One of the most magnificent and perfectly appointed affairs of modern times, its 500 covers were served at a cost to the French Government of something more than $15,000, exclusive of the wines. And as these were the choicest brands and of the most ancient lineage their cost must have been fully as great as that of the dinner itself.

A story is told that upon this occasion the correspondent of one of the great foreign journals interviewed the chef for the purpose of securing some authentic details concerning the dinner. Among other questions he asked: "And what was the chief novelty of the menu?" Instantly the great man stood upon his dignity and his voice was strong in its wrath as he replied: "Novelties! I would have you know that on the table of the guests of our country we lay no second editions." A reply which might have been made by Vatel, the chef who killed himself, being unable to survive the dishonor of the table for which he was responsible.

In the various descriptions of President Loubet's banquet to the reigning sovereigns of Russia little is said in regard to the decorations or service, the writers confining themselves to the menu, that being the most important feature of the feast. Mention is made, however, that the flags, flowers, ribbons, and spun-sugar ornaments united in a decorative scheme with effectively beautiful results.

In regard to the menu, however, it is apparent that it left nothing to be desired. The soups were clear turtle and Creme du Barry, which gave the guests a choice, after which "came a wonderful dish of soft roes called on the bill of fare 'Caisses de laitances Dieppoise,'

and another, 'Barbues dorees a la Vatel,' served with a remarkable sauce in which a hundred elements harmonized in a perfect whole. Venison with an acid dressing and braised quail, the most delicate bird of the species, a native of the vineyards of central France, followed the entrees. Afterward, in turn came sherbets, granites, etc., succeeded by truffled pheasants with champagne sauce, salad Potel, named for the chef who invented it, and similar delicacies." The triumphal achievement, however, was a savory entremet which is described as a "small pudding of asparagus heads served with a cream sauce." Hot-house fruits, ices, cheese, and coffee comprised the final courses of the feast.

One of the exhibits which attracted the most attention at the last Paris Exposition was a service of Sevres which was admittedly the most beautiful and costly production that the famous potteries had ever attempted. Upon each piece of china was pictured a danseuse, but no two were the same in either pose or type of loveliness. Realizing that the one "hobby" of the czarina was her love for beautiful china, of which she already had a famous collection, including the best specimens of the work of all the great potteries of the world, it was decided to copy this magnificent service in every detail. It was thus used at the banquet and was afterward presented to the first lady of Russia in the name of President Loubet.

The occasion upon which one nation entertains the rulers of another nation is an event when, if at any time, even the most ostentatious display might be regarded as permissible. If contrasted with the seemly manner of living in vogue among modern diners at ordinary times this banquet of the French President may, in some respects perhaps, have bordered upon ostentation. When compared to the extravagan feasts of other days, however, it seems striking in its simplicity, for nothing could have been in greater contrast to the extravagant luxury of the banquets of the ancients, to say nothing of that of many more modern rulers, that luxury which precedes, if it does not lead to, decadence.

MILES BRADFORD,
Author of 'Carlotta and I.'

Banquette, băn-kĕt', in fortification, the elevation of earth behind a parapet, on which the garrison of a fortress may stand, on the approach of an enemy, in order to fire upon them. Its dimensions vary, and it is frequently made double; that is, a second is made still lower.

Banquo, băn'kwō, a famous Scottish thane of the 11th century. In conjunction with Macbeth, cousin of Duncan, the king, he obtained a victory over the Danes, who had landed on the Scottish coast. Macbeth, shortly afterward, violently dethroned Duncan and caused him to be secretly assassinated. Banquo, though not an accomplice, was a witness of the crime; and being subsequently regarded by Macbeth with fear and suspicion, the latter invited him and his son, Fleance, to supper, and hired assassins to attack them on their return home during the darkness of night. Banquo was slain, but the youth made his escape. Shakespeare has interwoven this occurrence with the theme of his tragedy of 'Macbeth.'

Ban'shee, an imaginary female being supposed by some of the peasantry in Ireland and the Scottish Highlands to wail or shriek near a house when one of the inmates is about to die.

Bantam, băn-tăm', or băn'tam, a province occupying the whole of the west end of the island of Java, and containing a population of about 520,000. It long formed an independent kingdom governed by its own sultan, but at the beginning of the 19th century was formally incorporated by the Dutch with their other possessions. Rice is now the staple product. Its capital, which bears the same name, was once the principal mart of the Dutch, and was surpassed by few towns of the East in antiquity and celebrity. It is now very much decayed. Bantam is believed to give name to the well-known small but spirited breed of domestic fowl.

Ban'tam, any one of various breeds of diminutive fowls kept for pleasure, and partaking of the characteristics of the several breeds which they imitate in miniature. Thus the game-bantams are miniatures of exhibition game-cocks, and weigh about 22 ounces. The golden and silver Sebright bantams originated in America from a cross between a Polish fowl and a bantam, and are exceedingly beautiful in plumage. The rose-comb bantams are little copies of Hamburg fowls, and should be either lustrous black or pure white; and the cocks have a rose comb, square in front, evenly corrugated, and ending in a spike with a slight upward curve. Booted white bantams are those which have their shanks heavily feathered. The Cochin fowl is imitated in all its varieties by a bantam the cock of which weighs about 28 ounces. Most beautiful of all are the Japanese bantams, of which there are several varieties. The typical one is white with the tail black, and composed of long, sickle-like, white feathers held erect and edged with white. The wing quills are dark slate color edged with white, so that when the wing is folded it shows only white.

Bantayan, Philippines, a town in the province of Cebu, 62 miles north of the town of Cebu. Pop. 10,000.

Ban'teng, a wild ox (*Bos sondaicus*) of the mountain forests of the Malay Peninsula and Archipelago (except Sumatra), which greatly resembles the gaur (q.v.), and is by some considered a variety of that animal. These cattle are exceedingly fierce, and are regarded by sportsmen as among the most dangerous of game. Nevertheless they have been tamed, and when crossed with the domestic cattle of the region yield a serviceable hybrid.

Bant'ing, William, an Englishman of notable corpulence: b. 1797; d. 1878. By adopting a diet he was able to relieve himself of his superfluous flesh, and accordingly he wrote a pamphlet called 'A Letter on Corpulence' (1863), describing his system, which attracted so much attention that the term "to bant" has been incorporated in the English language to express the reduction of obesity by diet. See also OBESITY.

Ban'try, Ireland, a seaport town in county Cork, 56 miles west-southwest of Cork. It consists of four principal streets and a spacious square, but the town generally has a mean ap-

pearance. It has a growing trade, and fishing is carried on to some extent. Pop. (1901) about 3,000.

Bantry Bay, a deep inlet of Cork County, Ireland, remarkable both for its beauties and for its natural advantages, although the latter are turned to but little account. It is about 25 miles long and from 3 to 5 miles wide, and is safe and commodious for vessels of any size, the water being deep close to both shores, with few rocks or shoals. A French force tried to land here in 1796. The entrance is guarded by Crow Head on the northwest and by Sheep's Head on the southeast.

Bantu, bän'too, or bä-ntoo, the ethnological name of a group of African races dwelling below lat. 6° N., and including the Kaffirs, Zulus, Bechuanas, the tribes of the Loango, Kongo, etc., but not the Hottentots. The term is also used to denote the homogeneous family of languages spoken in Africa throughout the vast region lying between Kamerun, Zanzibar, and the Cape of Good Hope, with the exception of the Hottentot, Bushmen, and Pigmy enclaves. Ba-ntu, in almost all of these languages, signifies "the people," and hence is applied to the whole linguistic family. The Bantu family, although divided into hundreds of dialects, is evidently derived from one mother tongue.

Banu, bä'noo, or bän'noo, or **Bannu,** British India, a district in the Punjab; area 3,868 square miles; Pop. over 330,000. The district is watered by the Indus, which here, during inundations, becomes a vast body of water many miles wide. Nearly all the inhabitants are Mohammedans. Agriculture thrives, especially in the cultivation of the ordinary cereals, sugar-cane, cotton, and various oil seeds. The chief towns are Trakhel and Kalabagh.

Banvard, John, American artist, poet and dramatist: b. New York, about 1820; d. 1891. He was best known by his panorama of the Mississippi River, covering three miles of canvas, which was exhibited in the chief cities of Europe and America. He wrote a great number of poems; several plays: 'Banvard, or the Adventures of an Artist' (1849); 'Pilgrimage to the Holy Land' (1852), etc.

Banvard, Joseph, an American Baptist clergyman and historical writer, brother of the preceding: b. New York, 1810; d. 1887. Among his writings were 'Plymouth and the Pilgrims' (1851); 'Romance of American History' (1852); 'Memoir of Webster' (1853); 'Priscilla' (1854) a historical novel; 'Soldiers and Patriots of the Revolution' (1876), etc.

Banville, bän-vel, **Theodore Faullain de,** French poet and novelist: b. Moulins, 14 March 1823; d. Paris, 13 March 1891. He was the son of a naval officer, and went early in life to Paris, where he devoted himself exclusively to literature, contributed to many journals and reviews, and lived in close friendship with some of the foremost artists and men of letters of the day. First known as a poet through two volumes entitled 'The Caryatides' (1842) and 'The Stalactites' (1846), he established his reputation with the 'Odes Funambulesques' (1857), a sort of great lyrical parody, published under the pseudonym BRACQUEMOND, which immediately found great favor and was followed by 'New Odes Funambulesques' (1868, afterward reprinted as 'Occidentales'); 'Russian Idyls' (1872); 'Thirty-six Merry Ballads' (1873); etc. His dramatic efforts did not meet with equal success, only 'Gringoire' (1866) holding the stage for some time. As a prose writer he is favorably known by a number of humorous and highly finished tales and sketches, like 'The Poor Mountebanks' (1853); 'The Parisians of Paris' (1866); 'Tales for Women' (1881); 'The Soul of Paris' (1890), etc. Of considerable literary interest is 'My Recollections' (1882).

Banxring, bänks'rĭng, a tree-shrew of Java. See TREE-SHREW.

Banyan, bän'yän, or bän-yän', or **Banian-tree** (*Ficus Benghalensis*), an East Indian tree of the natural order *Urticaceæ,* noted for the roots which descend from the branches and become accessory trunks, thus permitting the original tree to extend over a wide area. In the Calcutta botanical garden one specimen, known to be upward of 100 years old, has more than 3,000 small trunks, 230 that vary from 2 to 3½ feet in diameter, and a main trunk 13 feet in diameter. Among these trunks 7,000 people could stand. The trees often attain a height of more than 70 feet. The leaves are ovate heart-shaped, five to six inches long; the inconspicuous axillary flowers are succeeded by cherry-like scarlet fruits which are eaten by monkeys. The seeds seldom germinate on the ground, but usually among the leaf bases of palms, the roots descending the palm trunks, embracing and finally killing them. As the banyan ages its original trunk dies and decays, leaving the younger trunks to support the life of the tree. The Hindus ascribe various medicinal virtues to this tree, which they regard as sacred. Its light porous wood, its juice, and its fruit have no important economic uses. Its close relative, *Ficus indica,* which does not root from the branches, is sometimes erroneously called the banyan-tree.

Banyumas, bän-yoo-mäs' (Javanese, "golden water"), a residency and town of Java. The area of the residuary is 2,100 square miles, and its population about 1,300,000. The chief culture is rice; but coffee, tea, sugar, indigo, cinnamon, and other exotics are produced by *corvée* labor, as enforced by the Dutch in other parts of Java. The town is on the river Seraic 22 miles inland. Pop. about 9,000.

Banyuwangy, the extreme eastern district of the island of Java, noted for its extensive coffee gardens, and for the remarkably pure sulphur obtained from the Goonong-Marapi volcanic mountain. This is also the name of the capital, an important seaport and Dutch military post, on the Strait of Bali, about 550 English miles east-southeast from Batavia.

Banz, bänts, once one of the richest and most famous of the Benedictine monasteries, on the right bank of the Maine, three miles below Lichtenfels, Bavaria. Founded in 1071, and destroyed in the Peasants' war in 1525, it was rebuilt, and although plundered again in the Thirty Years' war it gradually became famed for the scientific attainments of its monks. In 1803 it was broken up, and its library and collections were divided between the Munich museum and other institutions.

Baobab, bā'ō-băb (*Adansonia digitata*), a tree belonging to the natural order (or sub-order) *Bombaceæ,* and forming the only known species of its genus, which was named after the naturalist Adanson. It is also called the monkey-bread tree. The leaves are deep green, and are divided into five unequal parts radiating from a common centre, and each lanceolate in shape. This tree is a native of western Africa and is likewise said to be found in Egypt and Abyssinia; it is cultivated in many of the warmer parts of the world. It is one of the largest known trees, its trunk being sometimes not less than 30 feet in diameter. In Adanson's account of Senegal some calculations are made regarding the growth of this tree, founded on the evidence of the annular layers. The height of its trunk by no means corresponds with the thickness which it attains. Thus, according to his calculations, at one year old its diameter is one inch; and its height five inches; at 32 years old it has attained a diameter of two feet, while its height is only 22 feet, and so on; till at 1,000 years old the baobab is 14 feet broad, and 58 feet high; and at 5,000 years the growth laterally has so outstripped its perpendicular height that the trunk will be 30 feet in diameter and only 73 feet high. The roots, again, are of a most extraordinary length, so that in a tree with a stem 77 feet in girth the main branch or tap-root measures 110 feet in length. It often happens that the profusion of leaves and of drooping boughs almost hide the stem, and the whole forms a hemispherical mass of verdure 140 to 150 feet in diameter, and 60 to 70 feet high. The wood is pale-colored, light, and soft, so that in Abyssinia the wild bees perforate it and lodge their honey in the hollow, which honey is considered the best in the country. The negroes on the western coast apply their trunks to a very extraordinary purpose. The tree is liable to be attacked by a fungus which, vegetating in the woody part without changing the color or appearance, destroys life and renders the part so attacked as soft as the pith of trees in general. Such trunks are then hollowed into chambers, and within these are suspended the dead bodies of those to whom are refused the honor of burial. There they become mummies, perfectly dry and well preserved, without further preparation or embalming, and are known by the name of *guiriots.* The baobab is emollient and mucilaginous; the pulverized leaves constitute *lalo,* a favorite article with the natives, which they mix with their daily food to diminish excessive perspiration, and which is even used by Europeans in fevers and diarrhœas. The flowers are large, white, and handsome; and in their first expansion bear some resemblance to the white poppy, having snow-white petals and violet-colored stamens. Both flowers and fruit are pendant, and the leaves drop off before the periodical rains come on. The fruit is of an oblong shape, of considerable size, and tastes like gingerbread, with a pleasant acid flavor. The expressed juice, when mixed with sugar, forms a cooling drink much used in putrid fevers; this juice is generally used as a seasoning for corn gruel and other food.

Baour-Lormian, bă-oor-lōr-myäṅ, **Louis, Pierre Marie François,** French poet and dramatist: b. Toulouse, 1772; d. 1854. He first attracted wide notice through his 'Poems of Ossian' (1801), an extremely clever imitation of Caledonian verse; and afterward won success with a tragedy, 'Omasis, or Joseph in Egypt' (1807). Other works of his are 'Political and Moral Vigils' (1811), in the manner of Young; 'Duranti or The League in the Province' (1828), a historical novel; and 'Legends, Ballads, and Fabliaux' (1829). But his best work is probably a poetical translation of the book of Job, completed after he had lost his eyesight.

Bapaume, bă-pōm, France, a town in the department of Pas-de-Calais, 12 miles south of Arras. Here, on 2 and 3 Jan. 1871, took place two fierce struggles between the French Army of the North and the Prussian Army of Observation; the French being defeated with a loss of over 2,000.

Baph'omet, the name of a mysterious image which the Knights Templars were charged with worshipping when the order was suppressed by Philip IV. of France. It is probably a corruption of Mahomet, and the charge may have arisen from the circumstance that some of the Templars had gone over to the Moslem faith.

Baptan'odon, an extinct ichthyosaur or fish-lizard of the Jurassic period. Its remains have been found in the marine Jurassic shales of Wyoming and other western States, which have hence been called "Baptenodon Beds." It is distinguished from the true ichthyosaurus (q.v.) (found only in the Old World) by the form of the paddle-bones, which are rounded instead of polygonal, and was incorrectly supposed to be toothless, as its name indicates. The skulls are two to three feet long, so that the entire animal probably measured 10 to 15 feet, and resembled the ichthyosaurus in proportions and habits.

Baptism (from the Greek *baptizō,* from *baptizein,* to immerse or dip), the application of water to a person as a sacrament or religious rite. It is generally thought to have been usual with the Jews even before Christ, being administered to proselytes, but was probably nothing more than a ceremony of purification. From this baptism, however, that of John the Baptist differed, because he baptized Jews also as a symbol of the necessity of perfect purification from sin. Christ himself never baptized, but directed his disciples to administer this rite to converts (Matt. xxviii. 19); and baptism, therefore, became a religious ceremony among Christians, taking rank as a sacrament with all sects which acknowledge sacraments.

In the primitive Church the person to be baptized was immersed in a river or in a vessel, with the words which Christ had ordered, and a new name was generally bestowed at this time further to express the change. Sprinkling, or, as it was termed, clinic baptism, was used only in the case of the sick who could not leave their beds. The Greek Church and various Eastern sects retained the custom of immersion; but the Western Church adopted or allowed the mode of baptism by pouring or sprinkling, since continued by most Protestants. This practice can be traced back certainly to the 3rd century, before which its existence is disputed. Since the Reformation there have been various Protestant sects called Baptists, holding that bap-

tism should be administered only by immersion and to those who can make a personal profession of faith.

The Montanists in Africa baptized even the dead, and in Roman Catholic countries the practice of baptizing church bells,— a custom of 10th century origin,— continues to this day. Being an initiatory rite, baptism is, therefore, administered only once to the same person. The Roman and Greek Catholics consecrate the water of baptim, but Protestants do not. The act of baptism is accompanied only with the formula that the person is baptized in the name of the Father, Son, and Holy Ghost; but among most Christians it is preceded by a confession of faith made by the person to be baptized, if an adult, and by his parents or sponsors if he be a child.

The Roman Catholic form of baptism is far more elaborate than the Protestant. This Church holds that baptism is a sacrament which has the effect to remove in the individual the penal consequences of the sin of Adam, to restore him to a state of supernatural grace, and to give him a right to the beatific vision of God, remitting all actual sins committed by the individual. It also imprints an indelible character, which is both an ornament to the soul and a capacity for receiving the other sacraments. The effect of the sacrament is produced *ex opere operato*; that is, by an act of the Holy Ghost infallibly accompanying the performance of the external rite. Bishops, priests, and deacons are the ordinary ministers of baptism, and all others are forbidden to baptize except in case of necessity. Baptism is, however, valid when duly administered by any person, and any one may lawfully baptize in case of necessity. On the part of children and others who have never attained the use of reason no dispositions are required. In order to receive the sacrament validly a person who has the use of reason must know what he is doing and intend to receive baptism. In order to receive the grace of the sacrament he must have faith, and, if he has committed mortal sins, repentance; otherwise the grace of the sacrament remains suspended until he acquires the proper dispositions. Besides sacramental baptism, called *baptismum fluminis*, there are two substitutes which can supply its place, called, in a wide and improper sense, *baptismum sanguinis* and *baptismum flaminis*. The former of these is martyrdom, the second is the desire of baptism, accompanied by faith and perfect contrition or the love of God. These only supply the place of baptism when it cannot be had, and confer sanctifying grace, but not an indelible character. Solemn baptism is accompanied with the application of chrism and holy oil, and several other ceremonies of great antiquity.

Baptist Young People's Union of America, an association representing many young people's societies connected with the Baptist churches in the United States and Canada, organized June 1891 in Chicago, which place has since been its headquarters. Upon the formation of the Union, as the withdrawal of the Baptist societies was feared by the Christian Endeavor societies, a plan of federation was adopted for the establishment of young people's societies over which no constitution should be required. Conventions are held yearly.

Baptista, John, Carmelite poet: b. Mantua 1448; d. 1516. His poetical writings were well known throughout Europe during his lifetime; their correctness of form and choice Latinity caused them to be used as texts in the schools. His greatest poem is 'De Calamitate Temporum' ('On the Evils of the Day'), and is divided into three parts.

Baptistery, that part of the church, or a special building in which is administered the sacrament of Baptism. In the earliest ages of Christianity the solemn administration of this sacrament was reserved to the bishop, and to the episcopal church was generally annexed a special building called the baptistery. As the converts to Christianity increased it became necessary to set aside for the baptismal ceremonies a small space within the main building of the various parish churches.

Baptistines. (1) A religious order of women founded in 1744 in Genoa by Baptista Solimani. Their rule enjoined a strict fast throughout the entire year, the chanting of the office at midnight and conversation with friends or relatives restricted to three times during the year. (2) A congregation of secular priests founded in 1755 by Dominic Olivieri and placed under the jurisdiction of the Cardinal Prefect of the Propaganda by Pope Benedict XIV. The congregation ceased to exist at the end of the 18th century.

Baptists, a religious body originating in England early in the 17th century as a result of the Separatist movement. Among the Separatists was John Smyth, who emigrated from Gainsborough with his people to escape persecution, and at Amsterdam established a new congregation upon the principle of baptism on confession of faith. Some members of this Church returned to England and in 1611 formed in London the first of the churches known as General Baptists, because they held the Arminian doctrine of a general atonement. The Particular Baptists (holding the Calvinistic doctrine of a particular atonement, that is, for the elect only) arose in 1633, when a number left a Separatist church in London to form a new congregation and were baptized anew on confession of faith. Another group withdrew from the same church in 1640, and shortly after introduced the practice of immersion, which was soon adopted by all the other churches and gave rise to the name by which they were known from 1644 onward. The Particular and General Baptists continued to be separate bodies until 1891, when they united.

There are other divisions among the general body, but all the churches agree in holding to the supremacy of the Scriptures as the rule of faith and practice; the necessity of personal faith and credible evidence of regeneration before baptism; immersion as the only baptism commanded by Christ or practised by his apostles; the independence of each church; and the entire separation between civil and ecclesiastical authority. On the question of communion English Baptists have been divided from the beginning. The earliest declarations were that only the baptized are authorized to partake of the Lord's Supper, but the practice of some churches was not in accord with this principle. At pres-

ent many churches admit not only to the communion but to membership those who have not been baptized. There are at present in Great Britain and Ireland 2,747 churches with 372,219 members. Baptist missions have established churches in many of the countries of Europe, as well as in Asia and Africa, and in the world there are now 50,978 Baptist churches and 4,705,953 members. The English Baptists may be traced back through the Continental Anabaptists, the Waldensians, Petrobrusians, and various other sects, to the 11th century. None of these bodies regularly practised immersion, so far as we know, but they agreed in holding the fundamental Baptist principle of a regenerate Church and rejected the baptism of infants as an unauthorized and post-apostolic practice.

Baptists in Amer'ica. (1) *From the first settlements to the Great Awakening.*— There were a few Baptists (or, as they were then usually called, Anabaptists) among the early settlers of the colonies, especially Massachusetts, but the first Baptist church was of independent origin. Roger Williams, a graduate of the University of Cambridge, a Puritan unable to conform to the Church of England, emigrated to the Massachusetts colony and landed in Boston in 1631. Here he soon developed theories that made him obnoxious, and he was therefore banished by the General Court, 8 Oct. 1635. The chief count against him was that he denied the authority of the civil magistrate to punish religious offenses. He made his way to Rhode Island, purchased land from the Narragansett Indians, and founded the colony of Providence on the principle of complete separation between civil and religious affairs. His study of the Scriptures led him to reject infant baptism, and others having come to his opinion a church of 12 members was constituted. Williams was baptized by one of them, Ezekiel Holliman, and he then baptized the others. As there is no indication of subsequent change in the method of baptism, here or elsewhere, it is reasonable to conclude that American Baptists have practised immersion from the beginning. Not long after this a church was established in the colony at Newport under the leadership of John Clarke, an English physician. A Welsh Baptist church emigrated bodily to Massachusetts in 1633 and ultimately settled at Swansea in 1667. This church was not greatly disturbed, but in Boston the Baptists experienced severe persecution. John Clarke and Obadiah Holmes, of the Newport church, visited the colony to comfort and confirm in the faith the few scattered brethren there, and were arrested for holding a religious service in a private house in Lynn. They were sentenced to be fined heavily, and in default to be "well whipped." This sentence was executed upon Holmes, in the streets of Boston, 6 Sept. 1661. Clarke's fine was paid by a friend, and he escaped. In 1665 a Baptist church was formed in Boston, consisting of nine members. Thomas Goold, its leading member and first minister, was so continuously imprisoned and ill-treated that his health was shattered, and he died in 1675. Other members suffered in like manner. A small meeting-house was built in 1678, whereupon the doors were nailed up by order of the court. The new charter of the colony, in 1691, granted "liberty of conscience to all Christians except Papists," but Baptists were still taxed for the support of the churches of the "standing order." Even when the heavy hand of the Puritan official was restrained, progress did not become much more rapid, for prior to 1740 there were but eight Baptist churches in Massachusetts. In the other New England colonies growth was proportionally slow. The first church in Connecticut was that at Groton, established in 1705, probably by Baptists from Rhode Island.

The most marked progress of Baptists was in the group of colonies afterward known as the Middle States. The centre of this growth was the town of Philadelphia. In the near-by village of Pennepek or Lower Dublin (now incorporated in the city) a church was founded in 1688, mainly of Baptists from Great Britain, and a preaching-station was appointed in Philadelphia, which was not formally recognized as a separate church until 1746. The Welsh Tract Church was formed in 1701 in a place now in the State of Delaware. In the neighboring colony of New Jersey a simultaneous beginning had been made. The church at Middletown had been formed in 1688, and the following year a church that had been organized at Dover, N. H., emigrated in a body and became the Piscataway Church. Churches at Cohansey (1690), Cape May (1712), and Hopewell (1715) followed.

In the New York colony the first church was established at Oyster Bay, L. I., about 1700, and in 1714 a second church was formed in New York city — both organized through the labors of some Rhode Island Baptists. After 1730 the New York church ceased to exist, and it was not until 1745 that another attempt was made to found a Baptist church there; and so feeble was this that it did not attempt an independent existence until 1762.

The oldest church in the southern colonies was first constituted in Maine, then a part of the Massachusetts settlement. A few people at Kittery were baptized in Boston and organized a church, but they were so much disturbed by persecutions that they decided to emigrate to Charleston, S. C., and became the First Baptist Church of that city in 1684. Some General Baptists settled in the Virginia colony in 1714, and other churches were rapidly formed. From 1727 onward Baptist churches were founded in North Carolina, and a church was established in Maryland in 1772. The Carolina churches proved to be especially fruitful. From these feeble and unpromising beginnings there resulted a great growth during the remaining years of the 18th century.

The division that from the first existed among the English Baptists seemed likely to be perpetuated in America. In New England the majority of the earliest churches were or became Arminian in theology, and the first churches in the colony of New York appear also to have been of that order, together with several of the New Jersey congregations. But the Philadelphia group and part of the New Jersey churches were strongly Calvinistic, and gradually they took the lead and became the controlling force.

This result was promoted, if not caused, by the formation of the Philadelphia Association. The five oldest and nearest churches (Pennepek, Welsh Tract, Middletown, Piscataway, Cohansey) from the beginning cultivated close relations with one another, and were accustomed to hold "general meetings" with the various

churches in turn, at which members of all the others attended as far as possible. These meetings were at first annual, and then came to be held twice a year, in May and September. As the churches grew, such mass-meetings became less practicable, and in September 1707, when the meeting was held in Philadelphia, the other churches sent delegates. The practice continued thenceforth without interruption, and so the first association of Baptist churches was formed. Such associations differ from the synods and conferences of other denominations in that they have no legislative or judicial authority over the churches, which retain their complete independence. The association has advisory powers only, and considers questions of common interest to the churches composing it, especially measures for the more effective spread of the gospel. It thus becomes a missionary and evangelic institution, and as such has been one of the most powerful agencies in the growth of Baptist churches in America.

The Philadelphia Association gradually drew to its membership not only all the Baptist churches of the middle colonies, but those farther south, and at its most flourishing early period had 31 churches on its roll, extending from New York to Virginia. By 1742, seemingly before, this association adopted a Calvinistic confession of faith,—in large part identical with the Westminster Confession,—and this Philadelphia Confession soon became by common consent the standard of faith and practice among American Baptist churches, and still holds that position over large regions. It ought to be added, however, that among Baptists no confession has any real authority, such documents being regarded as only convenient statements of what the Scriptures are believed to teach; and among Baptists it is to the Scriptures, and not to any confession, that appeal is always made.

2. *From the Great Awakening to the Founding of the General Convention.*—The spiritual movement known as the Great Awakening (q.v.), judged by its results, was the most important single event in the history of American Christianity. On no religious body did it have more happy, far-reaching and permanent results than upon the Baptists. The new spiritual life into which they were quickened is shown by the rapid advance made by them in all the colonies after 1740. In 40 years the churches increased in Massachusetts from 8 to 73, and the members from about 200 to over 3,000. This means, of course, that not only were many new churches constituted in the colonies already named, but that the other colonies were entered. From 1750, churches were organized in New Hampshire, and from 1780 in Vermont. In Maine the planting of churches began again in 1768. In 1784 there were in New England 151 churches with 4,783 members—an enormous increase, nearly 10 times the number of churches and quite 10 times the number of members that existed a generation before.

In the South the increase was even more rapid, especially in Virginia and the Carolinas. In Virginia the Baptists were rigorously persecuted, their preachers being imprisoned and fined with great severity, but even in prison they preached the gospel and made converts. The Kehukee Association, organized in 1765 in Virginia, and the Ketockton, in 1766 in North Carolina, testify to the rapid progress made in these regions. By a series of statutes passed between 1776 and 1798 Virginia repealed all her punitive and incorporating laws, and placed all forms of religious belief on an equal footing before the law. The progress of the Revolution so broadened men's ideas that the other colonies followed her example, although New England lagged behind, and Massachusetts did not fully banish intolerance from her laws until 1833. This principle of separation of Church and State, long advocated by Baptists and at length made the fundamental law of the United States and of each several State, is recognized by foreign jurists as the most important contribution to political philosophy and the science of government yet made by America.

The war of the Revolution naturally caused a serious check to religious progress in the colonies, but less to the Baptists than to most other bodies. The Episcopal Church was badly disorganized, and almost destroyed, because her ministers were mostly Tories and were driven from their parishes; but the Baptist ministers were patriots, with but a single known exception. The Methodists were greatly embarrassed in a similar way—their preachers were nearly all from England, and John Wesley was a violent writer against the cause of the colonies and their "wicked rebellion." Except where actual hostilities prevailed, the Baptist churches suffered little, and as a whole were stronger at the close of the war than at the beginning, ready for an immediate advance and a rapid growth, since they could take advantage of every favorable opportunity.

And one of the greatest opportunities ever offered any religious body was theirs at the close of the war. The settlement of the great West began actively at once. Two great tides of immigration set westward: the one from New England, by the fertile valleys of central New York toward Ohio, and Illinois; the other from Virginia, Maryland, and Pennsylvania, over the mountains by the old Indian trail to Pittsburg, and thence into Ohio or down the river to Kentucky and Tennessee. Among the early settlers of these new regions were not a few Baptists; and the churches and associations in the older regions sent out missionary preachers to visit the new settlements and organize churches wherever possible. It thus came to pass that Baptist churches were often the first, always among the first, to be formed in the new communities of the West, and their growth was rapid. By the year 1800 the denomination had increased to 1,200 churches, and their members to more than 100,000. The formation of associations had kept pace with the growth of churches; prior to 1800 there were 48 such bodies formed, nearly all of which carried on active missionary operations for the planting of new churches and the aiding of those newly planted to sustain themselves. This missionary activity of the associations is the distinctive feature of the period, and more than any other thing explains that unexampled growth, far outstripping that of the population.

3. *From the Formation of the General Convention to Its Division in 1845.*—The most important forward step of American Baptists was their engaging in the work of foreign missions. This was done through no plan of their own, but in obedience to the leadings of Divine Providence.

Some young men of New England Congregational churches, while students at Williams College and later at the Andover Theological Seminary, became deeply interested in the giving of the gospel to the heathen, and in consequence the American Board of Commissioners for Foreign Missions was constituted in June 1810. Three of the first missionaries sent out,—Adoniram Judson, his wife, and Luther Rice,— became convinced from independent study of the Scriptures that only believers should be baptized, and that immersion was the sole apostolic baptism. Accordingly they were baptized by English Baptist missionaries at Calcutta shortly after their arrival, and by consequence severed their relations with the Board that had sent them out. Mr. Rice returned to America to tell the story and enlist the Baptist churches in the support of these missionaries. This was comparatively easy, but by his tour among them the churches had become so aroused to their unfulfilled duty toward the heathen that they were not content merely to support the Judsons. Local missionary societies were formed in several States, and at length delegates from churches throughout the country met at Philadelphia in May 1814, and organized the «General Convention of the Baptist Denomination in the United States for Foreign Missions.» This furnished the churches what they greatly needed,— a common cause, a rallying-point,— and at once the Convention and its work became a strongly unifying influence. The missionary work thus begun was prosecuted with zeal, liberality, and success. The Judsons went to Rangoon and began a mission among the Burmans in 1813; the Karens were reached in 1828; and missions followed among the Chinese (1833), Telugus (1836), and Assamese (1836).

For a time it seemed that all Baptist churches would unite in the support of this work, but after some years opposition began to develop among the churches that held to an extreme form of the Calvinistic theology. This opposition finally became directed against ministerial education, Sunday-schools, and all organization for evangelic effort, as well as against the Convention. The agitation of these extreme views finally led to a withdrawal of a part of the churches from all fellowship with the others, and those thus withdrawing became known as Old School, or Primitive Baptists, since they claimed to be faithful to the original principles of the body, from which the others had departed. The agitation was most bitter in the central Atlantic States, but the Primitive Baptists became most numerous in some of the southern States, especially Tennessee and Georgia, where, among the mountain districts, they are still very numerous. They are popularly known as «Hard Shells.»

The Convention, in addition to its foreign missionary enterprise, also for a time conducted some home-mission operations, and local societies in several States were organized for this work. All of these agencies proved insufficient, and in 1832 the American Baptist Home Mission Society was formed in New York to take special charge of this enterprise, setting free the General Convention to devote its whole attention to foreign missions. But this was not the end of organization. The efficient conduct of home missions was found to demand further subdivision of effort, and after the second decade of the century State conventions were rapidly formed in the various States for the supervision of missionary work in the older communities, leaving the national society to overlook the newer regions of the great West. The rise of Sunday-schools was synchronous with this development of missionary effort, and called into being new forms of organization. Among Baptists it gave new life to a tract society that had been formed in 1824 in Washington, and caused its removal to Philadelphia and its growth into the American Baptist Publication Society, which, since 1840, has given a great share of its capital and effort to the publication and circulation of Sunday-school literature. The work of foreign missions led to the making and printing of versions in the various languages of the mission fields. Some of these were printed by aid from the American Bible Society, formed in 1816 by representatives of the chief evangelical denominations; but after a time Baptists were denied equal rights in this body, and in April 1837 a convention held at Philadelphia formed the American and Foreign Bible Society for doing this work.

This was the period, not only of perfecting organization, but of controversies that resulted in great loss to Baptists. The rise of the body now known as Disciples of Christ, led by Alexander Campbell and others, from 1815 to 1835, caused great disturbance and loss to Baptists in the middle West and South. Mr. Campbell had been a Baptist preacher, and many Baptist churches went bodily into the new movement. In the Middle and Eastern States, during the same period, William Miller led many astray by his predictions regarding the speedy end of the world, and the ultimate result of his teaching was the formation of the Second Advent body, into which many Baptist churches and members went. At nearly the same time and in the same region the famous anti-Masonry agitation (q.v.) also convulsed the churches and hindered their progress, where it did not actually deplete their numbers. But this was also a period of great revivals and rapid numerical growth, not peculiar to any one part of the country. Beginning the century with some 1,200 churches and 100,000 members, Baptists had grown to 8,406 churches and 686,807 members in 1845, about one Baptist to each 32 persons of the population.

The greatest controversy of the period, and that which had most lasting results, was that caused by the institution of slavery. After about 1825 anti-slavery sentiment rapidly grew strong in the northern States, and among the Baptist churches of that region the opinion generally prevailed that a Christian man could not consistently be the owner of slaves. The General Convention had been organized on the principles of the Federal Constitution — of giving equal rights to slaveholders and non-slaveholders; but as in the State, so in the Church, this compromise proved unworkable after a time. For several years fierce debates were held on the subject at the meetings of the Convention, and the feelings of both sections grew more embittered. At length the Executive Board declared that they could not appoint a slaveholder as a missionary, and the southern churches felt this to be a denial of their constitutional rights. Accordingly in May 1845 a convention met at Augusta, Ga., and formed the Southern Baptist Convention. The mission

work, home and foreign, of the southern Baptist churches has been done since that time through this body, under the supervision of various boards appointed for the purpose. This work was necessarily interrupted by the Civil War, but was resumed with new vigor at the conclusion of that struggle, and has been prosecuted with increasing liberality and success. The Convention is a strictly delegated body.

4. *The Last Half Century.*—The last 50 years have been a time of great increase in numbers and wealth. At the close of the 19th century there were 43,959 churches and 4,181,686 members, about one person in 18 of the population. The rate of progress has therefore been almost double that of the population, marvelous as the latter has been, and a very small percentage of this had been gained by immigration. The valuation of church property in 1900 was $86,648,982, the expenditure for public worship $9,622,166, the contributions for missions $1,123,839, and for all other purposes $12,348,527. Corresponding facts for 1850 and earlier years are not ascertainable, but it is certain that the wealth of the churches has increased fully twice as fast as the membership, and within the last 15 years the contributions have doubled, showing a commensurate growth of liberality.

But in this last half century the most marked feature of denominational progress has been in educational work. Very early in their history Baptists began to found colleges and other institutions of higher learning. Brown University was established in 1764, and was followed by Colby (1818), Colgate (1819), Columbian (1821), and Lewisburg (1846). Two theological seminaries were early founded: Hamilton (1817) and Newton (1825). In the West and South 16 other institutions that still survive were established before 1850, not to mention a few academies. The combined endowments of all these schools in 1850 would probably not have exceeded $500,000. In 1900 there were 7 seminaries, 31 colleges, 32 schools for women only, 46 academies, and 17 schools for negroes and Indians. These schools had over 38,000 students enrolled, and in them has been invested over $44,000,000, of which fully half is productive endowment.

Two thirds of the Baptists of the United States are in the south, and of these far more than half are negroes. The separate organization of the colored Baptists dates, of course, from the Civil War. The first of their State conventions was formed in 1866 in North Carolina, and like societies have been organized in 15 States. In the North a large part of their churches are members of the regular associations. The National Baptist Convention was organized in 1880, and was expected to perform an office for their churches similar to that of the Southern Baptist Convention for the white churches. But there have developed ambitious leaders among them, and divided counsels have resulted, and there has been in consequence a multiplying of organizations very confusing to those who attempt to follow their history and work. Owing to the lack of education among them, reports of meetings are defective and statistics untrustworthy, and no definite statements of their work can be attempted.

Besides what are often called the "regular" Baptists,—those in full fellowship with each other and enumerated above,—there are numerous other bodies, aggregating 500,000 members, that hold substantially the same principles. The Freewill Baptists are perhaps the largest of these. The name describes two different groups of churches: one originating in North Carolina about 1729, and having its representatives mainly in the South; the other arising in New Hampshire about 1780. The former are known as Original Freewill Baptists, and practise feet-washing and anointing the sick with oil as gospel ordinances. The latter have of late adopted the name Free Baptists, are Arminian in theology, and practise "open" communion. They are strongest in New England and the Middle West. A general conference was organized in 1827, a Foreign Mission Society in 1834, and an Education Society in 1840. They now have about 85,000 members, and the southern churches may have 12,000 more. The Six-Principle and Seventh-Day Baptists also originated in New England. The former began in Rhode Island, where several of the earliest churches came to be known by this name. The churches of this order mostly held Arminian views, but differed from other Baptist churches mainly in insisting on the laying on of hands immediately after baptism, believing this to be one of the six principles enumerated in Heb. vi. 1, 2. The first Seventh-Day church was formed in Newport in 1671; their distinctive principle is indicated by their name. The German Seventh-Day Baptists had a separate origin in Pennsylvania about 1728, from the Dunkards or Tunkers, who settled in Germantown from 1719 and onward. They are sometimes called German Baptists, but that name is more properly applied to German congregations of the "regular" Baptists. The Church of God, or Winnebrennerians, the River Brethren, and one branch of the Mennonites, also agree in the main with the principles and practices of Baptists.

Besides the United States, Baptists are represented in all parts of North America, especially in Canada. Since 1778, Baptist churches have existed in Nova Scotia and New Brunswick, and about 1794 began a like movement in lower Canada, near the Vermont line. The organization of the Maritime churches came first, beginning with an association formed in 1800, and extending until a convention for general missionary purposes united several earlier societies in 1846. Churches were planted in Ontario after 1803, and organization proceeded along the usual lines. In 1888 all previously existing societies were consolidated by act of the Dominion Parliament into the Baptist Convention of Ontario and Quebec, which conducts its work through five executive boards. The Canadian Baptists have now grown to over 1,000 churches and 100,600 members.

In Mexico and the West Indies the Baptist churches are of recent missionary origin. The chief exception is in Jamaica, where English Baptists began operations nearly a century ago, the first church having been formed in 1816. The Southern Baptist Convention has taken Cuba as its special field, while Northern Baptists have established a mission in Porto Rico. In the West Indies, Mexico, and Central America there are now not far from 50,000 Baptists.

HENRY CLAY VEDDER,
Crozer Theological Seminary.

Bar, Karl Ludwig von, German jurist: b. Hanover, 1836. He was trained in the universities of Göttingen and Berlin, and sat in the Reichstag 1890–3. He has been a strong advocate of publicity as well as of more humane procedure in all criminal trials. Important works by him are: 'Das Internationale Privat- und Strafrecht' (1862); 'Die Redefreiheit der Mitgleider gezetzgebender Versammlungen' (1868); 'Die Lehre vom Kausalzusammenhange in Rechte (1871); 'Das Deutsche Reichsgericht' (1875); 'Staat und Katholische Kirche in Preussen' (1883).

Bar-Cochba, Simon, celebrated Jewish impostor of the 2d century A.D., who pretended to be the Messiah. He called himself, or was called by his followers, Bar-Cochba, meaning Son of the Star, and applied to himself Balaam's prophecy, "There shall come a star out of Jacob,' etc. He obtained the support of the celebrated Rabbi Akiba, and availing himself of the general dissatisfaction produced among the Jews by Hadrian's attempt to erect a temple to Jupiter on the site of the temple of Jerusalem, raised the standard of revolt, and soon mustered numerous followers. After carrying on a kind of guerilla warfare, he made himself master of Jerusalem about 132, and gained possession of about 50 fortified places. Hadrian, who had at first despised the insurrection, now saw the necessity of acting more vigorously, and sent to Britain for Julius Severus, one of his ablest generals, who, avoiding a general engagement, gradually made himself master of the different forts which the rebels possessed, and then, though not without great loss, took and destroyed Jerusalem. Barcochba retired to a mountain fortress, and perished in the assault of it by the Romans three years after, about 135.

Bar, Russia, a town in the government of Podolia; so called after the birth-place of its foundress, Bona Sforza, the wife of King Sigismund I. of Poland. It is famous as the place where a confederation of the Polish people was held with a view to combating the Russian influence and the adherents of Russia in Poland, 29 Feb. 1768. The Russians took Bar by storm on the following 28 May, together with 1,400 men and 20 pieces of cannon. Eleven fairs are annually held here. Leather-dressing, distillery, and brick-making are carried on. Pop. (1900) 13,000.

Bar. In heraldry, one of the charges known as ordinaries. It is formed by two horizontal lines passing over the shield and occupying one fifth of the surface.

In hydrography, a barrier of sand in the channel of a river or along the seacoast. Rivers are constantly engaged in the transportation of sediment seaward, and whenever the current is checked the suspended material sinks and accumulates along the bottom. Bars thus formed may disappear during periods of floods when the water gains increased velocity, and they frequently change their position with slight alterations in the course of the current. Sand bars are also common at the mouths of rivers where the flow of the water, and therefore its transporting power, is lessened before entering the sea. The precipitation of the sediment is assisted in this case by the mingling of the fresh and saline water. The formation of such bars does not differ from that of a delta (q.v.). The transporting action of currents and waves sometimes builds up a long line of bars or reefs along the seacoast, as is seen on the Atlantic and Gulf shores of the United States. See REEF.

In law, a word having several meanings; thus, it is the term used to signify an enclosure or fixed place in a court of justice where lawyers may plead. In English superior courts queen's counsel are admitted within the bar; other members of the bar sit or stand outside. A railed-off space within the Houses of Lords and Commons is similarly called the bar. The dock, or enclosed space where accused persons stand or sit during their trial is also called the bar; hence the expression "prisoner at the bar." It has also a general meaning in legal procedure, signifying something by way of stoppage or prevention. There is also a trial at bar — that is, a trial before the judges of a particular court, who sit together for that purpose in banc (q.v.). The term is used both in England and the United States as a synonym for the legal profession.

In music, a line drawn vertically across the staff, for the purpose of dividing the music into equal measures of time. The term is very often improperly applied to measures themselves. The quantity of time included between two bars varies as the time is triple or common, the former being equivalent to three crotchets and the latter to four. The thick bar at the end of a piece of music is called the double bar. Bars were first used about the middle of the 15th century. See MEASURE.

Bar Har'bor, Me., a popular summer resort in Hancock County, Me.; on the east shore of Mount Desert Island. It derives its name from a sandy bar which connects Mount Desert with the largest of the Porcupine group. The surrounding scenery is very pleasing, and within a short distance are many points of interest readily accessible to the tourist. Among these are the summit of Green Mountain, Eagle Lake, Mount Newport, Kebo, The Ovens, Great and Schooner Heads, Spouting Horn, Thunder Cave, and Eagle Cliff. Pop. (1900) 1,600.

Bar Shot, a double-headed shot, made of two half-balls connected by a bar, and formerly used in naval battles for cutting away the masts and rigging of the enemy's ship.

Bar-le-Duc, bär-lĕ-dük, or **Bar-sur-Ornian,** bär-sür-ôrnăn, France, capital of the department of Meuse, 125 miles east by south from Paris. It consists of an upper and a lower town, the former of which commands a fine view. The lower town extends into the valley traversed by the Ornain, here crossed by three stone bridges. It is a busy active place, with many shops, manufactories, and warehouses. The streets are wide and well laid out, but the public buildings are inferior. The chief manufactures are cotton yarn, cotton, and woolen stuffs, printed calicoes, and colored handkerchiefs. The preserved fruits and confectionery, as well as the wines of Bar-le-duc, are in repute. Pop. (1896) 18,249.

Bar-sur-Aube, bär-sür-ōb, France, a town 30 miles east of Troyes, notable as the scene of a victory of the allied forces commanded by Schwarzenberg over the French, commanded by Macdonald and Oudinot, 27 Feb. 1814. The

council which decided the plan of campaign of the allies was held here the day before the battle. Pop. (1896) 4,548.

Bar-sur-Seine, bär-sür-sān, France, an ancient town in the department of Aube, notable as the scene of a victory of the allied forces over the French, in March 1814. Pop. (1896) 3,157.

Bara, bä'ra, **Jules,** Belgian statesman: b. Tournai, 1835; d. Brussels, 26 June 1900. He early displayed oratorical gifts, and soon after beginning the practice of law was appointed professor of law in the University of Brussels. He entered the House of Deputies in 1862 as a Liberal, and was appointed minister of justice in 1865. For the remainder of his career he was prominent in the Liberal ranks whether in the Cabinet or as a member of the House of Deputies, his power of scathing invective being instrumental in causing the resignation of the clerical ministry of d'Anethen in 1871 and the fall of that of Malou in 1878.

Baraba, bä-ra-bä', a steppe of Siberia, in the government of Tomsk, occupying more than 100,000 square miles. Covered with salt lakes and marshes, it was colonized in 1767 by the Russians, who have since cultivated parts of it. Pop. 250,000.

Barabas, ba-răb'as, the principal personage in Marlowe's tragedy, 'The Jew of Malta.'

Barab'bas, the robber released by Pilate at the Passover when Jesus was condemned to death. It was a custom of the Roman government, for the sake of conciliating the Jews, to release one Jewish prisoner, whom they might choose, at the yearly Passover. Pilate desired thus to release Jesus, but the Jews demanded Barabbas (Matt. xxvii. 16–26). (2) The title of a novel by Marie Corelli, having him as the central figure.

Barabbas: A Dream of the World's Tragedy, a romance by Marie Corelli. It is the story of the last days of Christ, his betrayal, crucifixion, and resurrection. The story is dramatically told, but the style is florid and meretricious, appealing more to the emotions than to the reason.

Barabins'ki, a Tartar tribe living on the banks of the river Irtish, and engaged in pastoral and agricultural pursuits. Their religion is Shamanistic, but Christianity has made some progress among them.

Baraboo, băr'a-boo, Wis., a city and county-seat of Sauk County, on the Baraboo River, and the Chicago & N. W. R.R.; 40 miles northwest of Madison and 3 miles from Devil's Lake. It is an agricultural region; has important manufacturing interests, which are promoted by an excellent water power; is a noted fruit centre; and has a national bank, city hall, water works, electric light, gas works, daily, weekly, and monthly periodicals. It is governed by a mayor, elected biennially, and a municipal council. Pop. (1900) 5,751.

Barabra, bä-rä'bra, a Nubian people living on both sides of the Nile, from Wady Halfa to Assouan. They are about 40,000 in number, and are believed to belong to the same stock as the ancient Egyptians.

Baracoa, bä-ra-kō'a, Cuba, a seaport near the eastern end of the island, and its capital, 1518–22. The town was founded in 1512. Near it is the mountain noted as the «Anvil of Baracoa.» In the vicinity Maceo and his men began in 1895 the struggle for Cuban independence. Pop. (1899) 4,937.

Barada, bä-rä'da, the Abana of the Bible, a river of Syria, rising in the Anti-Libanus and flowing across the plain to the east past Damascus. It loses itself in a lake called Bahret-el-Ateibeh. Around Damascus its waters are used for irrigation by means of canals.

Baraga, băr'a-ga, **Frederic,** Austrian Roman Catholic prelate and missionary: b. Treffen, Carniola, 29 June 1797; d. Marquette, Mich., 19 Jan. 1868. He came to the United States in 1830 and spent the rest of his life among the Chippewa and Ottawa Indians in Michigan. His Chippewa grammar (1851) and Chippewa dictionary (1851–3) are of philological importance, and he was also the author of a work in German on the 'History, Character, Manners, and Habits of the North American Indians' (1837).

Baraguay d'Hilliers, bă-ra-gā-de-yā', **Achille, Count,** marshal of France: b. Paris, 1795; d. 1878. He was the son of Louis Baraguay d'Hilliers (q.v.). In 1830 he took part in the expedition to Algeria, in which his success gained him the confidence of the government, which created him a lieutenant-general. In 1841 he was made governor-general of Algeria. On the fall of Louis Philippe in the revolution of 1848 the provisional government appointed him to the command of the military division of Besançon. He replaced Changarnier in the command of the Army of Paris, and concurred in the accomplishment of the *coup d'état* on 2 Dec. 1851. In the war with Russia in 1854 Baraguay d'Hilliers was commander-in-chief of the Baltic expedition, and for his services received the dignity of marshal of France, and later was nominated a senator. He took an active part in the campaign of 1859, when France leagued with Sardinia to free Italy from Austrian domination.

Baraguey d'Hilliers, Louis, French general: b. Paris, 1764; d. Berlin, 6 Jan. 1813. Receiving an appointment in the army of Italy from Napoleon, he shared all the success of the campaign of 1796–7. Made general of division and commandant of Venice, in 1798 he accompanied the expedition to Egypt; and afterward successively held appointments on the Rhine, in the Tyrol, and in Catalonia. He commanded a division in the Russian campaign of 1812, but during the retreat incurred the displeasure of Napoleon and appears to have died from chagrin and disappointment.

Baralt, bä-rält', **Rafael Maria,** Venezuelan poet and historian: b. Maracaibo, Venezuela, 2 July 1814; d. Madrid, Spain, 2 Jan. 1860. He was educated in Bogotá and at Caracas; served in the Venezuelan army, and went to Spain in 1843, where he held posts of honor and attained literary fame. He wrote 'Ancient and Modern History of Venezuela' (1841); and 'Odes to Columbus and to Spain.'

Baranoff, bä-rä'nōf, **Alexander Andrevich,** Russian trader: b. 1746; d. 1819. He founded a trading colony on Bering Strait (1796) and established commercial relations with the United States, China, and Hawaii. He was the first governor of Russian America.

Baranoff Island, the most important of the Alexander Islands, Alaska. It is about 75 miles long. On its northwest coast is the town of Sitka. The island derives its name from the Russian trader, Baranoff (q.v.), who in 1799 took possession of it.

Barante, bă-rănt, **Aimable Guillaume Prosper Brugière, Baron de,** French historian and statesman: b. Riom, Auvergne, 10 June 1782; d. 23 Nov. 1866. After filling some subordinate offices he was appointed in 1809 prefect of La Vendée. In this year was published his 'Tableau de la Littérature Français au XVIIIe Siècle,' of which Goethe has said that it contains neither a word too little nor a word too much. In 1815 Louis XVIII. made Barante secretary of the Ministry of the Interior, and about the same time he took his seat in the Chamber of Deputies, where he voted with the Moderate Liberals. In 1819 he was raised to the Chamber of Peers. His principal work, 'Histoire des Ducs de Bourgogne de la Maison de Valois, 1364–1477' (1824–8), secured his election to the Academy in 1828. Between 1830 and 1840 he represented France at Turin and St. Petersburg, but after the revolution of 1848 he devoted himself entirely to literary pursuits. Other works of his are: 'Histoire de la Conventionale' (1851–3); 'Histoire du Directoire' (1855); 'Etudes Historiques et Biographiques'; 'Etudes Littéraires et Historiques' (1858). Consult also 'Souvenirs du Baron de Barante' (1890–9).

Baran'ya, Hungary, a province of, bordering upon the Danube River, having an area of 1,966 square miles and a population of 361,743 in 1900.

Barasingha, băr-ạ-sĭn'gạ. See SWAMP-DEER.

Barata'ria Bay, a body of water in the southeastern part of Louisiana, extending north from the Gulf of Mexico, between the parishes of Jefferson and Plaquemine. It is about 15 miles long by 6 wide, and it and the lagoons branching out of it were rendered notorious about the years 1810-12 as being both the headquarters and rendezvous of the celebrated Lafitte and his buccaneers.

Barata'ria, Pirates of, a company of outlaws under the leadership of a notorious bandit, Jean Lafitte, who established their rendezvous in the Bay of Barataria, 40 miles south of New Orleans. They committed great depredations on English and Spanish shipping, but their colony was broken up in 1814 by a United States naval force. Lafitte and some of his men subsequently served under Jackson in the battle of New Orleans.

Bar'athron, the name of a deep gorge near Athens, into which criminals condemned to death were thrown. It was originally a quarry, but was enlarged in order to serve for purposes of punishment. Usually persons were thrown into it after execution, but occasionally while living.

Baratier, bä-rä-tēr', **Johann Philipp,** German littérateur, remarkable for the precocity of his intellect: b. Schwabach, 1721; d. Halle, 5 Sept. 1740. At the age of 7 he understood Greek and Hebrew, and 2 years later he compiled a Hebrew dictionary. He was 13 when he translated the 'Itinerary of Benjamin of Tudela.' Excess of work and perhaps a too rapid development of his intellectual faculties brought about a languid malady, and at the age of 19 he died.

Baratynski, bä-ra-tĭn'ske, **Jevgeni Abramovich,** Russian poet: b. within the government of Tambov, 1800; d. Naples, 1844. He enlisted as a private soldier at 18, and by 7 years' service in Finland fought his way to the rank of an officer, which, however, he soon resigned to devote himself to a literary life. His first poem, 'Eda,' is a mirror of Finnish life and feeling: his greatest, 'The Gypsy.'

Barb, a horse of the Barbary breed, introduced by the Moors into Spain, and of great speed, endurance, and docility. This breed is said to be a variety of the Arabian, and most of the progenitors of the present thoroughbred horse were of the same strain.

Bar'bacan, or **Barbican,** a projecting watch tower or other advanced work before the gate of a castle or fortified town. The term barbacan was more especially applied to the outwork intended to defend the drawbridge, which in modern fortifications is called the *tête du pont.* At the castles of Warwick and Alnwick the mediæval barbacans still remain, but the barbican gate at York is almost entirely of modern construction.

Barbacena, bär-ba-sā-'na, a flourishing town of Brazil in the State of Minas Geraes, 125 miles northwest of Rio de Janeiro. It is situated in the Mantiqueira Mountains, about 3,500 feet above the sea. Pop. 5,000.

Barba'dos, an island of the West Indies, lying in the Atlantic Ocean more than 100 miles east of the nearest members of the chain of Lesser Antilles. (See ANTILLES.) No other country, with the possible exception of some of the provinces of China, is more densely populated, the inhabitants (about 20,000 white persons, and approximately 169,000 negroes) averaging 1,120 to the square mile. The entire area of the island available for the purpose,— or 100,000 acres out of a total acreage of 106,470,— is under cultivation. Some of the white inhabitants are of the best English stock, being descendants of early settlers who were closely allied by the bond of blood or ties of friendship with the colonists of Virginia. The only foreign journey ever taken by George Washington was in 1752, when he visited this island in company with his invalid brother, Lawrence. The rainfall is abundant, and the climate agreeable, thanks to trade-winds blowing steadily across the Atlantic. Barbados is a colony of England, with its own governor, legislature, etc. In addition to many lesser educational institutions the island has Codrington College, which is affiliated with the University of Durham, England. Its principal city, Bridgetown, headquarters of the Royal Mail Steamship Company, is an attractive place of residence and a favorite resort of tourists. It is also the see of the bishop of Barbados. There is one narrow-gauge railway, and the highways are excellent. The chief and almost the sole industry is the cultivation of sugar-cane, to which the soil is peculiarly adapted. Food supplies are imported largely from the United States, to which country nearly the entire sugar product is sent. The value of the annual exports is about $3,600,000; of the average annual imports about $5,000,000. Like

Guadeloupe and its dependencies, and Désirade and Maria Galante, Barbados is a coral island. Its length is 21 miles, and its width 15 miles. It is situated in lat. 13° 4′ N., and lon. 59° 37′ W. Consult Stark, 'History and Guide to Barbados.'

MARRION WILCOX,
Authority on Latin-America.

Barba'dos Cedar, a cedar or juniper (*Juniperus barbadensis*). It is found in Florida and the other warm parts of America.

Barbados Cherry, a West Indian shrub or small tree (*Malpighia glabra*) of the natural order *Malpighiaceæ,* with handsome crimson axillary flowers, cultivated to some extent in warm countries for its acid fruit, inferior to but resembling a white cherry. *M. urens* also bears an edible but smaller fruit, and is sometimes also called Barbados cherry.

Barbados Flower Fence, or **Barbados Pride,** the beautiful plant *Poinciana pulcherrima.* It belongs to the leguminous order, and the sub order *Cæsalpinieæ.* It is a low, spiny tree with an odor like savin. It is a native of the tropics of both hemispheres, and in Barbados especially it is used for fence purposes.

Barbados Goose'berry, Blad Apple, or **Lemon Vine** (*Pereskia aculeata*), a shrubby, slender, tropical American cactus which bears lemon-yellow, smooth, edible pear- or egg-shaped fruits as large as olives. The species is widely used in greenhouses as a stock on which to graft other species of cacti. Its more sturdy relative, *P. bleo,* is similarly used for larger species of cacti.

Barbados Leg, a name frequently applied to the disease called elephantiasis. It is common in Barbados, and is endemic in many tropical and semi-tropical countries. See ELEPHANTIASIS.

Barbados Lil'y, the *Amaryllis equestris,* now called *Hippeastrum equestre,* an ornamental plant from the West Indies.

Bar'bara, Saint, virgin and martyr much honored in the Greek and Roman Catholic Churches who is supposed to have flourished in the 3d or early part of the 4th century. Her history has been related by various chroniclers, but with so many discrepancies that it is difficult to ascertain either the events of her life or the circumstances of her martyrdom. According to Jacobus de Voragine, the author of the 'Aurea Legenda,' she was born at Heliopolis, in Egypt, of pagan parents. On arriving at the age of womanhood she was very beautiful, and her father, fearing lest she should be taken from him, confined her in a tower, and in the pictures of this saint the tower is therefore one of her most frequent attributes. In her seclusion she heard of the preaching of Origen, and wrote to him begging for instruction, whereupon he sent one of his disciples, who taught and baptized her. On learning this her father was so incensed that he put her to death. Metaphrastes and Mombritius inform us that she was martyred at Heliopolis in the reign of Galerius, and their account agrees with the Emperor Basil's Menology and with the Greek Synaxary. Others again hold that she suffered at Nicomedia, in 235, under Maximian I. Her festival occurs 4 December.

Barbara Allen's Cruelty, an old English ballad preserved in Percy's 'Reliques.' While Barbara's lover, Jemmy Groves, was on his death-bed, her only remark to him was, "Young man, I think you're dying." For this unnatural composure she subsequently endured the pangs of remorse.

Barbara Frietch'ie, the title of a noted poem by Whittier (1863) founded upon an incident reported to have occurred in Frederick, Md., in the Civil War. Recent investigations have thrown some doubt upon the authenticity of the account. A play upon this theme has been written by the dramatist Clyde Fitch.

Bar'bara's History, a novel by Amelia Blandford Edwards, published in 1864. It is the romance of a pretty girl, clever and capable, who, passing through some vexations and serious troubles, settles down to an unclouded future.

Barbarelli, Giorgio. See GIORGIONE.

Barba'rian, a term used by the Greeks to designate a foreigner; one who could not speak Greek. At first the Romans were included by the Greeks under the term barbarian; but as the inhabitants of the great Italian city gradually gained imperial power, and, moreover, began to consider the Greek language a desirable if not even an indispensable part of a liberal education, they were no longer placed in the category of barbarians, nor was their speech deemed barbarous. When the Greeks became the most civilized people in the world, the term barbarian came to be used with some reproach, but less so than among ourselves now.

Barbaros'sa, Arooj, or **Horuk,** corsair chieftain, styled "Barbarossa" from his red beard. He was the son of a Greek at Mitylene, and in 1516 assisted Selim, king of Algiers, in driving the Spaniards out of that country. Having taken possession of the capital he put Selim to death and mounted the throne himself. He died in 1518.

Barbarossa, Khair-ed-Din, the younger brother and successor of the preceding. He surrendered the sovereignty of Algiers to Selim I., Sultan of Turkey, in exchange for a force of 2,000 janissaries and the title of dey. He was afterward appointed "captain pasha" or high admiral of the Turkish fleet, conquered Tunis, and in 1538 gained a victory over the imperial fleet under the command of Andreas Doria in the Bay of Ambracia. He died in 1546.

Barbaros'sa. See FREDERICK BARBAROSSA.

Barbaroux, bär-bä-roo, **Charles Jean Marie,** celebrated French revolutionist of the Girondin party: b. Marseilles, 6 March 1767; d. Bordeaux, 25 June 1794. At first an advocate and journalist at Marseilles, he was sent by that city to the Constituent Assembly at Paris. There he opposed the Court party and took part with the minister, Roland, then out of favor. After the events of 10 Aug. 1792 he returned to his native town, where he was received with enthusiasm, and was soon after chosen delegate to the convention. In the convention he adhered to the Girondists, and belonged to the party who at the trial of the king voted for an appeal to the people. He boldly opposed the party of Marat and Robespierre, and even directly accused the latter of aiming at the dic-

tatorship; he was, consequently, in May 1793 proscribed as a royalist and an enemy of the republic. He fled to Calvados, and thence with a few friends to the Gironde, where he wandered about the country, hiding himself as best he could for about 13 months. At last, on the point of being taken, he tried to shoot himself; but the shot miscarried, and he was guillotined at Bordeaux. He was one of the great spirits of the Revolution. There was no loftier-minded dreamer in the Girondist ranks; hardly a nobler head than his fell in that reign of terror.

Barbary, a general name for the most northerly portion of Africa, extending about 2,600 miles from Egypt to the Atlantic, with a breadth varying from about 140 to 550 miles; comprising Morocco, Fez, Algeria, Tunis, and Tripoli (including Barca and Fezzan). Bordered by the Mediterranean on the north, and by the Sahara on the south, the temperature of this region is generally moderate and remarkably uniform, seldom descending to the freezing-point, and seldom coming up to sultry. From March to September is the dry season, when the ground is frequently so parched as to render walking upon it impracticable. From September to March is the wet season, but the rains are moderate, and almost every day affords a respite of sunshine. The soil is fertile, though sandy and light on the coast, the climate healthy, and agricultural productions are various and abundant. The range of production gives a combination of both tropical and temperate fruits. Agriculture is, nevertheless, greatly neglected. For three centuries the inhabitants of the Barbary states have rendered themselves the pest of human society by their depredations upon the commerce of the seas. Anciently, all Africa was comprehended under two divisions — Egypt and Libya — while Libya was subdivided into northern and southern Libya. North Libya comprised mainly what is now known as the Barbary states. Herodotus says that in his day northern Libya was inhabited by the indigenous race of Libyans and by the foreign Phœnicians and Greeks. These latter settled at various points, from Egypt to Carthage, while the indigenous Libyans occupied from the east to the west, throughout the entire extent. Of the origin of the Libyans, whom Herodotus calls indigenous, we have no trace. Arabian tradition says they colonized Libya from Yemen. The Phœnicians early settled Carthage (869 B.C.) and perhaps the still more western coasts of Mauritania,— at least it appears that Carthage was a powerful state at the invasion of Greece by Xerxes. The Cyrenians, who were Greeks, had colonized at Cyrene, just east of the bay of the Mediterranean called Syrtis Major (Gulf of Sidra), in what is now known as Barca. West of Carthage lay Numidia and Mauritania, even to the Pillars of Hercules; east of Cyrene was Egypt; while between these two foreign colonies stretched the narrow coast line, from the Major to the Minor Syrtis, known as Emporia. The rapidly growing Carthaginian power soon extended colonies along the entire coast from the Pillars of Hercules to Grecian Cyrene. The jealousy of Rome was not long in being awakened against so threatening a rival. The history of the Punic wars is well known. At the end of 117 years the Carthaginian power was extinguished. Carthage herself in ruins, and Africa a Roman province from Mauritania to Cyrenaica. The more complete subjugation of Numidia was accomplished in the Jugurthine war, and that of Mauritania in the reign of Claudius. Thus the territory of the Barbary states, from independent native sovereignties and foreign colonies, had come into the hands of Rome. About 400 A.D. several Teutonic tribes, overrunning Gaul and crossing the Pyrenees, settled in Spain. When, in 428, Boniface revolted against Honorius, the Vandals crossed the Fretum Gaditanum into Africa, led by Genseric, drove out the inhabitants, utterly expelled the Roman power from upper Libya, and reigned 100 years. Then came the struggle under Justinian for the re-establishment of the Roman ascendency. By Belisarius it was conducted to a successful issue, and northern Africa was united to the eastern empire. For over 300 years this relation continued until about the middle of the 7th century; the Saracens overran Numidia and Mauritania to the Atlantic, and, notwithstanding the disastrous death of their leader Okba, the sceptre of upper Libya passed again from the hands of Rome into that of Arabia. Fifty years later the conquests of Musa and Tarik were pushed across the straits, and a Saracenic empire established in Spain. But the revolution which brought the Abbasides to the caliphate of Arabia and drove the only surviving caliph of the Ommiades into Spain, prepared the way for the independence of the western colonies, and Africa began to throw off the Saracenic yoke (788). A succession of fortunes now attended the states of upper Libya. For eight centuries they were alternately tributary and independent, passing from hand to hand, like the stakes of a faro bank, till in the 16th century the two brothers Barbarossa conquered the whole territory of Numidia and Carthage, and erected the regencies of Algiers and Tunis. A few years later the Turkish Sultan, whose supremacy the younger Barbarossa had acknowledged, erected the pashalic of Tripoli over the ancient Cyrenaica, while in the west there was a gradual consolidation of power into the hands of Mohammed ben Hamed, and his son, who finally established the dynasty of Sherifs in the empire of Morocco, while the French erected, between Morocco and the possessions of the Porte, the regency of Algeria. The religion of the Barbary states is generally Islamism. The European settlers are of course Christians, or Jews, while the blacks, who are slaves, are pagans. There seem to be at present six races or tribes of men inhabiting the Barbary States: (1) The Moors. (2) The Arabs. (3) The Berbers, who are indigenous, and from whom the states probably received the appellation Barbary. (4) The Jews. (5) The Turks, who are the military of the country. (6) The Blacks. The Arabs call the Barbary states *Moghreb* (west). The language of the people inland differs from that of Arabia and Syria, though not so much as on the coast. See ALGERIA; BARCA; FEZZAN; MOROCCO; TRIPOLI; TUNIS.

Bar'bary Ape, or **Magot,** a small species of ape of the genus *Macacus,* interesting as being the only animal of the monkey kind in Europe. It is found on the rock of Gibraltar, where the individuals are few in number; whence it has been concluded by M. de Blainville that they have sprung from domesticated

apes escaped from confinement in the houses of Gibraltar. The Barbary magot is a small tailless monkey completely covered with greenish-brown hair. In its wild state it is lively and intelligent, but becomes sullen and intractable in captivity.

Barbary Powers, U. S. Treaties and Wars with the. The four Mohammedan states of Morocco, Algiers, Tunis, and Tripoli, though either independent or nominally tributary to Turkey, were for some three centuries a common foe to Mediterranean commerce and travel. Almost their entire subsistence was on the produce of piracy: either the avails of captured stores, the ransoms for prisoners held in slavery, or the blackmail paid by other powers for immunity. The large states paid them a regular annual tribute,—though by joining forces they could have stopped the piracy at any time,—on the express ground that it gave them the monopoly of Mediterranean trade against the small ones which could not afford it; and England, which paid about $280,000 a year, deliberately put the price high to prevents others from bidding up to it. Even these sums bought only temporary truce, as the pirate state lived on depredations, and the tribute had to be supplemented with constant presents and concessions. A part of this tribute was always demanded in armed vessels, ammunition and naval stores, so that the civilized powers furnished the means for plundering themselves. The ransom of captives from them was a leading object of public and private charity, and collections were taken up in churches for this end. In 1786 there were 2,200 Christian captives in Algiers alone. When the United States began to send vessels to the Mediterranean no longer protected by the English flag, the pirates at once assailed them; and in July 1785, the Algerines captured 2 vessels and 21 men. Congress appropriated $80,000 in 1784 to buy immunity after the European model; but it seemed likely to cost nearer $1,000,000, and, reversing their usual parts, John Adams preferred to pay as a cheaper resort than fighting, while Jefferson considered fighting both cheaper, more honorable, and the preparation for a better future. Morocco, for some reason much the most amenable, signed in 1787 a 50-years' peace without tribute, though with the understanding of some presents to the Sultan, and kept it, save for a short time in 1803. The Dey of Algiers asked $59,496 for his captives, or over $2,800 each, though the last French captives ransomed had only cost $300, or with costs, $500; and the matter hung fire for several years, 11 of the 21 dying before the final ransom of 1795. In 1793, by the carelessness or bad faith of an English consul, the Algerine corsairs gained entrance to the open sea beyond the Strait of Gibraltar, and captured 10 United States vessels at a blow, the number of our captives in their hands in November being 115. Negotiations were set on foot, and on 5 Sept. 1795 Congress paid Algiers $992,463.25 for peace and the ransom of all our prisoners—this sum including a 36-gun frigate costing $99,727, and about $100,000 worth of stores and ammunition. It also engaged to pay $21,600 a year thereafter in naval stores, $20,000 on presentation of a consul, biennial presents of $17,000, and other regular and incidental gifts. In 1798 it sent four armed vessels as arrears. A treaty was made with Tripoli in November 1796, on much the same terms save that there were no ransoms; and one with Tunis, in 1799, for $107,000. The cost of immunities and ransoms in 1802 had been over $2,000,000; and of course even this bought nothing permanent. The pasha of Tripoli broke the treaty in three years and a half, demanding $225,000 with $25,000 annually, and on refusal declared war, 14 May 1801. A squadron under Commodore Dale was sent to the Mediterranean and blockaded Tripoli, also forcing Algiers and Tunis to think better of their threatened alliance with it and to renew their treaties. Morris succeeded him, but was soon recalled. Preble, who took his place, 1803–4, forced Morocco, which had joined Tripoli, to withdraw from the alliance and renew its treaties; carried on a vigorous blockade; and bombarded Tripoli five times. Barron succeeded Preble, but in the middle of 1805 turned over the command to Rodgers, who at once prepared for a grand bombardment and assault. The scale was turned, however, by William Eaton (q.v.), who took up the cause of the pasha's elder brother, Hamet Caramelli, driven from the throne some years before, organized at Alexandria a singular rabble of cosmopolites, and after a desperate six weeks' march across the desert, captured, with the aid of the navy, the seaport of Derne in Barca, several hundred miles east of Tripoli. The pasha feared an insurrection as well as Rodgers' attack; and hastily signed on 3 June 1805, with Tobias Lear, United States consul-general at Algiers, who had come to Tripoli on purpose, a treaty by which the United States paid $60,000 ransom for the prisoners, left Hamet's supporters to the pasha's vengeance and Hamet himself to beg the United States for a pension, and allowed the pasha four years to deliver up Hamet's wife and children. The need and honor of this abject surrender of our government belongs to historical polemics. The embargo of 1807 prevented further trouble for some years by annihilating our commerce; but after its removal in 1810 the depredations were renewed, and in 1812 Algiers was ready for more gratifications. The dey had received from us $378,363, but made out a case for $27,000 arrears, forced the United States consul to borrow it at usurious rates, and then ordering him out of the country, declared war. The War of 1812, however, having denuded the Mediterranean of our trading-vessels, he captured only 1 brig and 11 persons; and after the war our naval force under Decatur was turned against Algiers. He found its entire fleet at sea; captured two and cut off the rest from port; entered the city 30 June 1815, 41 days after sailing; and forced the dey to sign within three hours, without gift or present, on pain of having his city destroyed and his fleet captured, a treaty abolishing all tribute or presents of any sort thereafter from the United States, delivering up all his captives and agreeing that henceforth prisoners of war should not be made slaves, and paying indemnity for the captured brig. Tunis and Tripoli having allowed English ships to seize American prizes in their harbors, Decatur proceeded to both places and forced their rulers to make similar treaties, pay indemnities, and release all their Christian prisoners of whatever nations. This magnificent action of the United States induced the English

government to take similar steps the next year, but Tunis and Tripoli did not abandon piracy till 1819, and Algiers was not finally reduced till 1829 by France. It was the United States which first lifted this incubus of "Algerine" (as the entire system was compendiously called) piracy and slavery from the Christian world. See Schuyler, 'American Diplomacy' (1886); Henry Adams, 'History of the United States,' Vols. I., II., IX. (1889–90); Felton, 'Life of Eaton,' in Sparks, 'American Biography.' See Treaties; United States — Diplomacy of the.

Barbastro, bär-bä'strō, Spain, a city of Arragon, 30 miles east-southeast of Huesca. The city has straight, well-made, and paved streets, a cathedral with paintings by Galeran, parish church, college, Latin and three other schools, town-house, session-house, ecclesiastical court-house, extensive hospital, two prisons, several convents with churches attached, two palaces, a theatre, and bull-ring. It also possesses philosophical, agricultural, commercial, and other literary and beneficent associations. The manufactures of Barbastro have greatly declined, consisting only of hats, hardware, cutlery, shoes, and ropes; while a little trade is carried on in cattle, horses, and mules. Pop. (1901) 8,300.

Bar'bauld, Anna Letitia, English writer, daughter of the Rev. John Aikin: b. Kibworth, Leicestershire, 20 June 1743; d. 9 March 1825. She received from her father a classical education, and early showed a disposition for poetry. Her earliest production was a small volume of miscellaneous poems, printed in 1772, which in the year following was succeeded by a collection of pieces in prose, published in conjunction with her brother, Dr. John Aikin, of Stoke-Newington. In 1774 she married the Rev. Rochemont Barbauld. Her 'Early Lessons and Hymns for Children,' and various essays and poems, have secured for her a permanent reputation. In 1812 appeared the last of her separate publications, entitled 'Eighteen Hundred and Eleven,' a poem of considerable merit; previous to which she had edited a collection of English novels, with critical and biographical notices. A similar selection followed from the best British essayists of the reign of Anne, and another from Richardson's manuscript correspondence, with a memoir and critical essay on his life and writings. She will be longest remembered by her beautiful and much quoted lyric beginning: 'Life, we have been long together.' See Aikin, 'Works of A. L. Barbauld'; Mrs. Thackery-Ritchie, 'Book of Sibyls' (1883).

Barbazan, bär-bä-zŏn, **Arnauld Guilhem, Sire de,** French captain, distinguished by Charles VI. with the title of "Chevalier Sans Reproche," and by Charles VIII. with that of "Restaurateur du Royaume et de la Couronne de France": b. about the end of the 14th century; killed at Bullegneville, 1432. He earned the former of his titles, while yet young, by his successful defense of the national honor in a combat fought in 1404 between six French and six English knights, before the Castle of Montendre; and the latter designation he acquired by his extraordinary exertions on the side of the Dauphin, at a time when the cause of native royalty, powerless in presence of the Anglo-Burgundian league, boasted few adherents.

Barbé-Marbois, bär-bā-mär-bwä, **François, Marquis de,** French statesman: b. Metz, 3 Jan. 1745; d. 14 Jan. 1837. After fulfilling diplomatic offices at several German courts he was sent to the United States as consul-general of France. He organized all the French consulates in this country, in which he resided 10 years, and married the daughter of William Moore, governor of Pennsylvania. In 1785 he was appointed by Louis XVI. superintendent of St. Domingo, and introduced many reforms into the administration of justice and of finance in that island. He returned to France in 1790 and was again employed in German diplomacy. During the excitement of the Revolution he was exiled to Guiana as a friend of royalty, but being recalled in 1801 he was made director of the treasury, a title which he soon exchanged for that of minister. In 1803 he was appointed to cede Louisiana to the United States for $10,000,000, but had the skill to obtain the price of $16,000,000, a piece of diplomacy for which he was liberally rewarded by Napoleon. In 1813 he entered the Senate, and the next year voted for the forfeiture of the emperor and the re-establishment of the Bourbon dynasty. He was well received by Louis XVIII., appointed a peer of France and honorary counsellor of the university, and confirmed in the office of first president of the court of accounts, which he had formerly held. He was an object of the indignation of Napoleon after his return to France from Elba, and was ordered to leave Paris. He resumed his offices after the return of the Bourbons, but, moderate in his principles, and an enemy of all reaction, he was not in harmony with the majority of those with whom he associated; and in the Chamber of Peers he succeeded with difficulty in effecting the substitution of banishment for death as a penalty for political offenders. After the revolution of July he exercised the same adulation and took the same oaths of fidelity to Louis Philippe which he had formerly given to Napoleon and the Bourbon princes. The desire to die first President, which had been the motive of all his flexibility, proved at last a vain one, and in 1834 he was succeeded in his office, and as a consolation received the portrait of the king, accompanied by an autograph letter. His numerous works contain curious details concerning St. Domingo, Louisiana, and Guiana, which he studied in his exile, and he wrote also upon the treason of Arnold.

Bar'becue, a large gathering of people, generally in the open air, for a social entertainment or a political rally, the leading feature of which is the roasting of animals whole to furnish the members of the party with food. The word is said to have been employed in Virginia prior to 1700, and the institution of the barbecue is of southern origin.

Barbel (*Barbus*), a genus of fresh-water abdominal malacapterygious fishes, of the family *Cyprinidæ*, or carps, distinguished by the shortness of the dorsal and anal fins, a strong spine replacing the second or third ray of the dorsal, and four fleshy filaments growing from the lips, two at the nose and one at each corner of the mouth, and forming the kind of beard to which the genus owes its name. Of the several species, generally named after the country or river where they are found, the European one, com-

mon in most of the rivers of its temperate climates, and hence called *B. vulgaris*, is most deserving of notice. Its average length is from 12 to 18 inches, but individuals have been taken measuring 3 feet, and weighing from 15 to 18 pounds. The head is smooth and oblong, and the upper jaw is much longer than the lower. Its dorsal spine, which is strong and serrated, often inflicts severe wounds on the fishermen and damages their nets. It lives on small fishes, and also on aquatic plants, worms, and insects, which it obtains by boring with its barbels into the banks of the stream and turning up the loose soil. Its flesh is very coarse and unpalatable, and at the time of spawning, the roe is dangerous to eat. Another species, common in the Nile, is described as weighing upward of 70 pounds, and has a flesh which is fine, delicate, and well-flavored. When caught, the fisherman puts an iron through its jaw and fastens it by a short cord to the bank of the river, where it remains alive till required.

Barber, Edward Atlee, American archæologist: b. Baltimore, Md., 13 Aug. 1851. He was graduated at Williston Seminary in 1869, and was assistant naturalist in the U. S. Geological Survey in 1874–5. Subsequently he was engaged in gold-dredging. His writings include a history of the ancient Pueblos; a large number of magazine articles on ceramics; 'Pottery and Porcelain of the United States'; 'Manual for Collectors of Blue China'; 'Genealogies of the Barber and Atlee Families,' etc.

Barber, Francis, American soldier: b. Princeton, N. J., 1751; d. Newburg, N. Y., 11 Feb. 1783. He graduated at Princeton in 1767, and became principal of a school in Elizabethtown, where Alexander Hamilton was one of his pupils. He was successively major and lieutenant-colonel of the 3d New Jersey artillery, and assistant inspector-general under Baron Steuben. He took part in the battles of Trenton, Princeton, Brandywine, and Germantown, and was severely wounded at Monmouth and in Sullivan's Indian expedition, 1779. He was of the greatest service to Washington in securing intelligence of the enemy's movements and in putting down the mutiny of New Jersey and Pennsylvania troops. In 1781 he commanded a battalion of infantry in Lafayette's Virginia campaign, and was present at Yorktown. He was killed by a falling tree at the close of the war.

Barber, John Warner, American author: b. Windsor, Conn., 1798; d. 1885. He wrote a 'History of New Haven' (1831); 'Incidents of American History' (1847); 'Elements of General History' (1844); and 'Our Whole Country' (1861), etc.; and assisted in compiling the historical collections of New York, New Jersey, Virginia, and Ohio.

Barber, one who shaves beards and dresses hair. The occupation of barber is an institution of civilized life, and is only known among those nations that have made a certain progress in civilization. It is referred to by the prophet Ezekiel: «And thou, son of man, take thee a barber's razor, and cause it to pass upon thine head and upon thy beard.» (Ezek. v. 1.) We do not read of a barber at Rome till about the year 454 of the city; but there, as elsewhere, when once introduced, they became men of great notoriety, and their shops were the resort of all the loungers and newsmongers in the city. Hence they are alluded to by Horace as most accurately informed in all the minute history, both of families and of the state. But in early times the operations of the barber were not confined, as now, to shaving, hair-dressing, and the making of wigs; but included the dressing of wounds, blood-letting, and other surgical operations. It seems that in all countries the art of surgery and the art of shaving went hand in hand. The title of barber-chirurgeon, or barber-surgeon, was generally applied to barbers. The barbers of London were first incorporated by Edward IV. in 1461, and at that time were the only persons who practised surgery. The barbers and the surgeons were separated, and made two distinct corporations — in France, in the time of Louis XIV., and in England in 1745. The sign of the barber-chirurgeon consisted of a striped pole from which was suspended a basin; the fillet round the pole indicating the riband or bandage twisted round the arm previous to blood-letting, and the basin the vessel for receiving the blood. This sign has been generally retained by the modern barber. In the United States, however, it is only occasionally that the basin may be seen hanging at the door of a barber's shop. The character of the barber is amusingly illustrated in one of the tales of the 'Arabian Nights Entertainments,' and has been immortalized by Beaumarchais, Mozart, and Rossini, under the name of 'Figaro.'

Barber-fish. See SURGEON-FISH.

Bar'ber Poet, The. See JASMIN, JACQUES.

Bar'ber of Seville, The, a five-act comedy by Pierre Augustin Caron (who later assumed the *nom de guerre* BEAUMARCHAIS). It is the first of the Figaro trilogy, the later plays being the 'Marriage of Figaro' and the 'Guilty Mother.' Upon it have been founded 'Il Barbiere di Liviglia,' an opera by Paisiello (1780), and 'Il Barbiere di Liviglia,' an opera by Rossini, first presented in 1816 and ever since extremely popular.

Barberini, bär-bär-rē'ne, celebrated Florentine family which became powerful through Cardinal Maffeo Barberini, who was elected Pope in 1623 as Urban VIII. Few of the Popes have carried nepotism so far as Urban, who, during his reign of 21 years, seemed intent on only one object, the aggrandizement of his three nephews. Two of them were appointed cardinals, and the third became Prince of Palestrina. The principality of Palestrina continued in the possession of the Colonna branch of the family until 1889, becoming extinct in the male line in that year.

Barberini Faun, a famous piece of Greek sculpture, so called from its having once been in the possession of the Roman family of Barberini. It is now in the Glyptothek at Munich.

Barberini Palace, the residence of the Barberini family in Rome, begun by Pope Urban VIII., its most distinguished member, but not finished till 1640. It contains a famous picture-gallery and a library with over 10,000 volumes and 10,000 MSS.

Bar'berry (*Berberis*), a genus of about 100 species of low ornamental shrubs of the natural order *Berberidaceæ*, natives of temperate climates, sometimes subdivided into species with

simple deciduous leaves (*Berberis*) and species with pinnate persistent leaves (*Mahonia*, q.v.). The yellow flowers are succeeded by red, dark-blue, or black fruit which in some species is used for making jellies of beautiful color and distinct flavor; that of some other species is dried and used like raisins. The yellow roots and sometimes the stems of several species are used in dyeing, and the bark of some in tanning. Many of the species are used for ornament and for hedges, but in wheat-growing sections they should not be planted, because they are host-plants for the æcidium stage of wheat-rust (*Puccinia graminis*), which, however, has been known to develop in localities remote from barberry bushes. *B. vulgaris* and its varieties and *B. thunbergii* (considered by some botanists a form of *vulgaris*) are probably the most common and valuable simple-leaved species planted in America. The former, an American species, is a rather erect shrub about 10 feet tall, with large leaves and racemes of flowers which are followed by red fruits that persist during the winter and even well into the second summer; the latter, a Japanese species, is a low, spreading, graceful shrub with dainty little leaves which become brilliant red in autumn, and with solitary yellow flowers followed by orange-red persistent fruits. The stamens, which in many if not all species are sensitive, spring up when touched. Propagation is usually effected by means of seeds or cuttings of green wood, but sometimes by grafts and layers. For description of species cultivated for ornament in America, consult Bailey and Miller, 'Cyclopedia of American Horticulture' (1900–2).

Barberry Blight or **Rust.** See RUSTS.

Barbers' Itch. Two distinct diseases of the skin are known by this name — one of a parasitic nature, the other not parasitic. In the latter there is an inflammation of the hair follicles characterized by the formation of papules and pustules pierced by hairs. It affects the hairy part of the face and runs a chronic course. It is more inclined to affect the upper lip and upper parts of the face. The more important disease is the *Tinea barbæ*, or parasitic disease. Here the hair follicles are infected by a fungus, the *trichophyton*. It is a form of ringworm of the beard. It affects the lower part of the face and neck, causing itching, scaly eruptions that secrete a thick mucus and spread out ring-like from the centre. The disease is always contracted from another person or sometimes from lower animals. Uncleanly barbers' implements are the chief agents in its spread. In the early stages — the parasitic form — it is readily curable, but in the chronic stages it may prove very difficult to treat successfully.

Bar'berton, Ohio, city in Summit County, 7 miles from Akron, and 39 miles from Cleveland; on the Erie, the Baltimore & Ohio, and the Pennsylvania Railroads. The town was founded in 1893 by O. C. Barber, president of the Diamond Match Company, whose works are located here. It is known as the "magic city" having acquired a population of 7,000 in less than 10 years. It is a progressive manufacturing centre having sewer-pipe mills, rubber works, potteries, iron works, paint mills, salt wells, strawboard works, and other industries. The city is governed by a mayor and city council elected biennially.

Barbès, Armand, bär-bĕs, är-mŏñ, French politician and revolutionist: b. Island of Guadaloupe, 1810; d. 1870. At an early age he was taken to France, and in 1830 went to Paris to attend the law classes, where he had an opportunity of manifesting his political opinions at that period of public excitement. During the whole reign of Louis Philippe he was constantly engaged in conspiracies. In consequence of an unsuccessful attempt to overthrow the government he was condemned to death, a sentence which was commuted to perpetual confinement. The revolution of 1848 restored Barbès to liberty. He then founded a club, which took his name, in which the doctrines of socialism were superadded to republicanism. After the insurrection of May 1849, Barbès was sentenced to deportation. In 1854 he was again set at liberty, and left France, a voluntary exile.

Bar'bet, any of the tropical South American birds of the families *Capitonidæ* and *Bucconidæ*, both of which are characterized by prominent bristles about the mouth, which assist them in catching flying insects. The birds of the former family are more usually called "thickheads," and those of the latter "puff-birds" (qq.v.).

Barbette, bär-bĕt', the platform or elevation of earth behind the breastwork of a fortification or an intrenchment, from which artillery may be fired over the parapet. An ascent leads from the interior of the intrenchment to the barbette. When the garrison has much heavy ordnance, or the enemy has opened his trenches, or when it is determined to cannonade the intrenchments of a given point,— as, for example, a bridge or pass,— and the direction of the cannon is not to be materially changed, it is usual, instead of making a barbette, to cut embrasures in the parapet; on the contrary, firing from the barbette is expedient when one expects to be attacked only by infantry, or wishes to cannonade the whole surrounding country. See FORTIFICATION.

Barbette Gun. See ORDNANCE.

Barbette Turret. See TURRET.

Barbey d'Aurevilly, bär-bā-dō-rĕ-vē-yę, **Jules,** French critic and novelist: b. Saint-Sauveur-le-Vicomte, Manche, 2 Nov. 1808; d. Paris, 24 April 1889. As a contributor to the *Pays* in Paris he created a sensation by the unreserved tone and peculiar style of his literary criticisms. He wrote 'On Dandyism and G. Brummel' (1845); 'The Prophets of the Past' (1851); 'Gœthe and Diderot' (1880); 'Polemics of Yesterday' (1889); 'Nineteenth Century: The Works and the Men' (1861–92). Of his novels the best are 'The Bewitched' (1854); and 'The Chevalier des Touches' (1864).

Barbiano, bär-byä'nō, Abrechtda, an Italian military officer, who formed the first regular company of Italian troops organized to resist foreign mercenaries, about 1379. This organization, named the "Company of St. George," proved to be an admirable school, as from its ranks sprang many future officers of renown. He became grand constable of Naples in 1384, and died in 1409.

Bar'bican. See BARBACAN.

Barbié du Bocage, bär-byā-dü-bō-kazh, **Jean Denis,** distinguished French geographer: b. Paris, 1760; d. there 1825. He laid the foun-

dation of his fame in 1788 by the publication of his beautiful Atlas to the 'Voyage du Jeune Anacharsis,' and was appointed in 1792 keeper of the maps of the Royal Library, and in 1809 professor at the Sorbonne. In 1821 he founded the Geographical Society, of which he became president. He was also a member of the Institute. His maps and plans to the 'Voyage Pittoresque en Grèce, de Choiseul Gouffier,' and to the works of Thucydides, Xenophon, etc., exhibit much erudition. He also prepared many modern maps, and published excellent dissertations in various scientific collections. Although the progress of time has necessarily deprived much of his work of its original value, his labors have not the less given a decided stimulus to the progress of science.

Barbier, bär-byā, **Antoine Alexandre,** French bibliographer: b. Coulommiers, 1765; d. 1825. In 1794 he went to Paris, where he was chosen a member of the committee appointed to collect works of literature and art existing in the monasteries, which were then suppressed. This was the cause of his being appointed in 1798 keeper of the library of the Conseil d'État, collected by himself, and when it was transported to Fontainebleau in 1807 Napoleon appointed him his librarian. On the return of the king he had the care of his private library. His excellent 'Catalogue de la Bibliothèque du Conseil d'État' (1801–3) is now very rare. His 'Dictionnaire des Ouvrages anonymes et pseudonymes' (1806–9, 4 vols., 3d ed. 1824), is, on account of its plan, its accuracy, and its fulness (at least in respect to French literature), one of the best works in this branch of bibliography.

Barbier, Henri Auguste, French poet: b. Paris, 29 April 1805; d. Nice, 12 Feb. 1882. Having written a historical novel (1830) with Royer, depicting French mediæval society, he entered his proper sphere, that of poetical satire, in which he obtained a brilliant success with 'The Iambes' (1831; 31st ed., 1882), a series of poignant satires, political and social, lashing the moral depravity of the higher classes,— notably the ignoble scramble for office under the new government, the subject of 'The Quarry,' the most famous among these satires. His next works, 'Lamentation' (1833), bewailing the misfortunes of Italy, and 'Lazarus' (1837), in which he describes the misery of the English and Irish laborer, show a considerable falling off; and in those that followed, the poet of 'The Iambes' is scarcely to be recognized. He was elected to the Academy in 1869.

Barbier, Paul Jules, a prolific French dramatist: b. Paris, 8 March 1825; d. 1901. Having won success with his first effort, 'A Poet' (1847), a drama in verse, he produced 'The Shades of Molière' (1847); 'André Chenier' (1849); 'Willy Nilly,' a comedy (1849); and thereafter in collaboration, mostly with Michel Carré, a number of dramas and vaudevilles, also countless librettos for comic operas. After the war of 1870-1 he published 'The Sharpshooter, War Songs' (1871), a collection of patriotic poems; and later two other volumes of lyrics, 'The Sheaf' (1882) and 'Faded Flowers' (1890); besides 'Plays in Verse' (2 vols., 1879).

Barbier de Seville. See Barber of Seville.

Barbiera, bär-byā'ra, **Raphael,** Italian poet and journalist: b. Venice, 1851. His contributions to periodical literature are particularly valuable, and he has published also several works on Italian literature and numerous anthologies.

Barbieri, Giovanni Francesco. See Guercino.

Barbieri, Giuseppe, Italian poet and pulpit orator: b. Bassano, 1783; d. Padua, 1852. He was distinguished for the tasteful eloquence of his sermons.

Barbizon, bär-bę-zôn, a village on the skirts of the forest of Fontainebleau; a favorite haunt of artists and tourists which has given its name to a school of French landscape painters. See also Barbizon School.

Barbizon School, the name applied to a school of French artists who settled in the village of Barbizon about 1844. Théodore Rousseau was the earliest of these, and after 1849 Jean François Millet lived in Barbizon; also Corot, Troyon, Diaz, and Daubigny were of this school, and the term came presently to denote those artists who went to nature for inspiration. See Millett, 'The Painters of Barbizon' (1890). Also see Corot; Millet.

Barbo'sa, Duarte, Portuguese traveler: b. Lisbon, 1480; d. 1521. He traveled all through India, visited the Molucca Islands, and was Magellan's companion and historiographer in his circumnavigation of the globe. He was murdered by the natives of the island of Cebu.

Barbou, bär'boo, the name of a celebrated French family of printers, the descendants of John Barbou, of Lyons, who lived in the 16th century. From his press issued the beautiful edition of the works of Clement Marot in 1539. His son, Hugh, removed from Lyons to Limoges, where among other works, his celebrated edition of 'Cicero's Letters to Atticus' appeared in 1580. Joseph Gerard, a descendant of the same family, settled in Paris, and continued in 1755 the series of Latin classics in duodecimo,— rivals to the Elzevirs of an earlier date,— which had been begun in 1743, by Coustelier. This series of classics is much prized for its elegance and correctness.

Barbour, bär'bėr, **Erwin Hinckley,** American geologist: b. near Oxford, O. He was assistant palæontologist in the United States geological survey in 1882–8; Stone professor of natural history and geology in Iowa College in 1889–91; became professor of geology in the University of Nebraska, and acting State geologist in 1891; and curator of the Nebraska State Museum in 1892. In 1893 he took charge of the annual Morrill geological expeditions, and since then he has also been engaged in the United States geological and hydrographic surveys.

Barbour, James, American statesman: b. Orange County, Va., 10 June 1775; d. 8 June 1842. He was admitted to the bar when 19 years old. He served in the Virginia legislature 1796–1812, becoming governor of the State in the latter year. Three years later he was elected to the United States Senate. He was secretary of war 1825–7, and minister to England 1828–9. In politics he was strongly anti-Democratic. He was chairman of the convention which nominated Harrison and Tyler for the presidency and vice-presidency.

Barbour, John, Scottish poet, of whose life but little is known. He is supposed to have been born about 1316; was educated at Oxford and Paris; and was a clerk in the king's household. He died in Aberdeen, 13 March 1395. His great epic, 'The Bruce,' tells the story of Robert Bruce and the battle of Bannockburn. It was written in 1375 and brought him favor from the king. First printed in Edinburgh in 1571; best modern edition by Skeat (Early English Text Society). He also wrote 'Legends of the Saints,' of 33,533 verses; and a fragment on the Trojan war.

Barbour, John Humphrey, American educator: b. Torrington, Conn., 29 May 1854; d. 29 April 1900. He was graduated from Trinity College in 1873, and ordained in the Protestant Episcopal Church in 1878. He was rector of Grace Church, Hartford, till 1889, and then became professor of New Testament literature and interpretation at the Berkeley Divinity School.

Barbour, Oliver Lorenzo, American lawyer: b. Cambridge, N. Y., 12 July 1811; d. 17 Dec. 1889. He received an academical education, and was admitted to the bar in 1832. During 1847–76 he was reporter of the New York court of chancery and the New York supreme court. He compiled a large number of legal digests, treatises on several branches of practice, and annotated editions of Collyer's, Chitty's, and Cowen's works.

Barbour, Philip Pendleton, American jurist: b. Orange County, Va., 25 May 1783; d. 24 Feb. 1841. He studied law at William and Mary College and began to practise in 1802. He led the war party in the Virginia legislature 1812–14, when he was elected to Congress, becoming speaker of the House in 1821. Four years later he was appointed a judge in his native State, returning to Congress in 1827; but later resigning through ill-health. He was subsequently appointed a Federal judge, and in 1836 was promoted to the supreme court of the United States. In politics he was a Democrat.

Barbour, William McLeod, American Congregational clergyman: b. Fochabers, Scotland, 29 May 1827; d. Malden, Mass., 5 Dec. 1899. He was graduated from Oberlin College in 1859, and from Andover Theological Seminary in 1861; was pastor in South Danvers (now Peabody), Mass., 1861–8; professor in Bangor Theological Seminary 1868–77; professor of divinity and college pastor in Yale 1877–87; and became principal and professor of theology in the Congregational College in Montreal, Canada, in 1887–96.

Barboursville, Ky., a town and county-seat of Knox County, 185 miles southeast of Louisville, on the Cumberland River, and the Louisville & N. R.R. The chief industries are mining and lumbering, but oil wells have recently been drilled and the region is being rapidly developed. Pop. (1900) 1,010.

Barboursville, W. Va., a town of Cabell County, situated on the Guyandotte River, and on the Chesapeake & O. and Guyandotte Valley R. R.'s It is the seat of Barboursville College, a Methodist institution, and is of historic interest as the scene of a Federal victory in the Civil War, 13 July 1861. Pop. (1901) 429.

Barbox Brothers, a short story by Dickens, with a second part known as 'Barbox Brothers & Co.'

Barbuda, bär-boo'da, West Indies, one of the Leeward Islands, belonging to Great Britain. It has a fertile soil, and produces tobacco, cotton, corn, and pepper. There are forts on the west side of the island, and a roadstead, but no port. The population is almost entirely negroes, and numbers less than 1,000.

Barbudo, bär-boo'dō, or **Barbu,** Spanish names in the West Indian region for the strange fishes of the family *Polynemidæ*. See MANGO-FISH.

Bar'by, Prussia, a town in the province of Saxony, on the left bank of the Elbe, 16 miles south-southeast of Magdeburg. It is well built and has an old castle, and manufactures of linen and cotton, soap-works, breweries, and distilleries. Pop. (1900) 5,137.

Bar'ca, a province of northern Africa, lying east of Tripoli, and belonging to Turkey, about 500 miles long by 400 miles wide. It forms a portion of the ancient Cyrenaica, in its widest sense, where the Greeks had two flourishing colonies. The Greeks were followed in possession of the country by the Romans, and the monuments of both peoples remain in the ruins of their cities. The sides and summits of the hills in the east and north are fertile, and yield abundant crops and excellent pasture. The loftiest heights do not exceed 1,800 feet. Flowering shrubs occur in great variety, including among others, roses, laurestinas, honeysuckles, etc. The Bedouin inhabitants have numerous camels and other cattle, constituting their principal wealth. Among beasts of prey the most common are hyenas and jackals; noxious insects also abound. There are hardly any permanent streams, most of the water-courses being of the nature of mountain torrents, which lose themselves in the sands of the Libyan Desert. The eastern portion, however, is tolerably well supplied with water by rains and springs. The chief exports of the country consist of grain and cattle, along with ostrich feathers and ivory, brought by caravans from the interior. Next to Bengazi, the capital, the seaport of Derna is the chief town. Barca used to form a dependency of Tripoli, but since 1879 has been an independent vilayet of the Turkish empire. The population is variously estimated, but probably does not much exceed 325,000.

Barcarolle, bär'ka-rōl, a song of the gondoliers at Venice, often composed by themselves, to some simple and pleasing melody, such as may be timed to the stroke of the oar. Such melodies are sometimes introduced into operas, and have been written for the piano.

Barcellona, bär-chĕl-lo'na, Sicily, a town in the province of Messina, situated on the Songanto River, 27 miles west of the town of Messina. It is noted for its sulphur baths which are frequented from May to September. It has a considerable trade, mostly in oil and fish. Pop. (1901) 23,493.

Barcelo'na, the second largest city of Spain. It is the capital of the province of the same name and of the military department of Catalonia, and is handsomely built, in the shape of a half-moon, on the coast of the Mediterranean, between the mouths of the Llobregat and the Besos. It was, even in the Middle Ages, one of the principal commercial places on this sea; is fortified; and has on the east side a

strong citadel, built in 1715. On the west lies the hill of Monjuich, with a fort which protects the harbor. Barcelona is divided into an upper and lower town, and contained, including the adjoining Barcelonetta, 509,589 inhabitants in 1897. Its manufactures are the most important in Spain. The principal are cottons, silks, woolens, machinery, iron castings, paper, glass, mathematical instruments, chemicals, stoneware, soap. There are also dyeworks, tanneries, etc. The harbor is spacious, and has an entrance 300 yards wide between two long piers. The entrance is protected by a large mole, which has been recently extended, and there is a large dry-dock. The exports largely consist of manufactured goods, wine and brandy, fruit, oil, etc. The so-called Barcelona (hazel) nuts are not exported from Barcelona, but from Tarragona. The city contains a university (in a noble pile of buildings begun in 1872), several libraries, a museum, a school for engineers and artillery, an academy of belles-lettres, a foundling hospital, a general hospital, large enough to contain 3,000 sick persons, a deaf-and-dumb institution, a large arsenal, a cannon foundry, several large theatres, a cathedral dating from the 13th century. It is altogether a beautiful and agreeable town, with various interesting features and highly picturesque surroundings. Electric lights and electric tramways have been introduced. Barcelona was an important city from a very early date, and was from the 9th till the 12th century governed by its own counts; but afterward by the marriage of Raymond IV. with the daughter of Ramiro II., king of Aragon, it was united with that kingdom. In 1640 it withdrew, with all Catalonia, from the Spanish government, and submitted to the French crown; in 1652 it submitted again to the Spanish government; in 1697 it was taken by the French, but restored to Spain at the Peace of Ryswick. In the war of the Spanish Succession Barcelona took the part of the Archduke Charles; but in 1714 was besieged by the troops of Philip V., under the command of the Duke of Berwick, and taken after an obstinate resistance. The strong citadel on the east side of the city was then erected to overawe the inhabitants. On 16 Feb. 1809, Barcelona was taken by surprise by the French troops under Gen. Duhesme, and remained in the power of the French till, in 1814, all their troops were recalled from Catalonia to defend their own country. In 1821 the yellow fever carried off 40,000 of the inhabitants. The city has been the scene of many serious and sanguinary revolts, particularly in 1832, 1836, 1840, and 1841. Latterly, industry and commerce have rapidly increased, the construction of railways contributing to this result. This city is regarded as the centre of anarchist movements in Spain.

Barcelona, Venezuela, the capital of a district and of the State of Bermudez, near the mouth of the Neveri, 160 miles east of Caracas. The surrounding country is fertile, but the city is very unhealthy. Cattle, jerked beef, hides, indigo, cotton, and cacao are the chief exports. Pop. (1900) about 13,000. The district, formerly a separate state, has since 1881 formed one of the divisions of the State of Bermudez.

Barchester Towers, a novel by Anthony Trollope. It is the second of the eight volumes comprised in his 'Chronicles of Barsetshire,' and is a study of social life in the clerical circle centring at the episcopal palace of Barchester.

Barclay, Alexander, English, or more probably Scottish, poet: b. about 1475; d. 1552. Very little is known concerning him except from his writings, which inform us that he was a priest and chaplain at St. Mary Ottery, in Devonshire, and afterward a Benedictine monk of Ely. His principal work is a satire, entitled 'The Shyp of Folys of the Worlde,' a free translation of a German composition. Barclay also wrote Eclogues, which are curious and interesting for the descriptions they afford of the characters and manners of the age.

Barclay, James, Canadian educator: b. Paisley, Scotland, 19 June 1844. He was licensed by the Paisley Presbytery in 1870; and was called to St. Paul's Church, in Montreal, in 1883. While in Scotland he was frequently summoned to Balmoral to preach before Queen Victoria. He served through the Riel rebellion in the Northwest Territories, in 1885, and, besides being connected with various local institutions, has been president of Trafalgar Institute since its opening.

Barclay, John, Scottish poet: b. Pont-à-Mousson, France, 1582; d. 1621. He accompanied his father to England, where he was much noticed by James I., to whom he dedicated a politico-satirical romance, entitled 'Satyrikon,' in Latin, directed against the Jesuits. He wrote also several other works, among which is a singular romance, in elegant Latin, entitled 'Argenis,' which first appeared at Paris in 1621. It is an allegory, of a character similar to that of Satyrikon, and alludes to the political state of Europe, and especially France, during the league. Like the earlier work, it has been several times reprinted, and has also been translated into several of the modern languages, including English.

Barclay, John, Scottish anatomist: b. Perthshire, 1760; d. Edinburgh, 1826. He studied divinity and was licensed as a preacher at Dunkeld. In 1789 he commenced the study of anatomy, and graduated in 1796, when he visited London and studied under Dr. Marshall. On his return to Edinburgh in 1797, he gave lectures on anatomy. He published several works on subjects connected with the sciences of medicine and surgery; he also made some efforts toward reforming the system of nomenclature then in use among anatomists. He bequeathed his valuable anatomical collection to the Royal College of Surgeons of Edinburgh, where it is known as the Barclayan Museum. He published 'Description of the Arteries of the Human Body' (1812).

Barclay, Robert, a distinguished member of the Society of Friends: b. 23 Dec. 1648, at Gordonstown, in the County of Moray, of an ancient and honorable family; d. 3 Oct. 1690. The troubles of the country induced his father, Col. Barclay, to send him to Paris, to be educated under the care of his uncle, who was principal of the Scots College in that capital. Under his influence he was easily induced to become a convert to the Roman Catholic religion, upon which his father sent for him to return home; and Col. Barclay soon after becoming a Quaker, his son followed his example. Uniting all the advantages of solid learning to great natural abilities, he soon distinguished himself by his talents and zeal in the support of his new opinions. His first treatise in support of

his adopted principles was published at Aberdeen in the year 1670, under the title of 'Truth Cleared of Calumnies,' etc. To propagate the doctrines, as well as to maintain the credit he had gained for his sect, he published, in 1675, a regular treatise, in order to explain and defend the system of the Quakers, which production was also very favorably received. These and similar labors involved him in controversies with the leading members of the University of Aberdeen, and others; but he was at the same time busy with his great work in Latin, 'An Apology for the True Christian Divinity, as the Same is Preached and Held Forth by the People in Scorn Called Quakers,' published at Amsterdam in 1676; an English translation appeared later in the same year. He traveled with William Penn and George Foxe through the greater part of England, Holland, and Germany, to spread the opinions of the Quakers. The last of his productions, in defense of the theory of the Quakers was a long Latin letter addressed, in 1676, to Adrian de Paets, 'On the Possibility and Necessity of an Inward and Immediate Revelation.' It was not published in England until 1686. With few exceptions, both partisans and opponents unite in the profession of great respect for the character and talents of Barclay. Besides the works already mentioned or alluded to, he wrote 'Cathechism and Confession of Faith' (1673); 'Theses Theologiæ' (1675), of which the Apology was a defense; 'The Anarchy of Ranters' (1676); 'Universal Love Considered and Established Upon Its Right Foundation' (1677); and various replies to the most able opponents of his Apology. In 1692 a collected edition of his works appeared under the title 'Truth Triumphant.' It was republished in 1717–18.

Barclay-Allardice, Robert, known as Capt. Barclay, the pedestrian: b. 1779; d. 8 May 1854. He entered the army (1805), and served in the Walcheren expedition (1809), but afterward devoted himself to agriculture, cattle-breeding, and the claiming of earldoms (Airth, Strathearn and Menteith). His feat of walking 1,000 miles in 1,000 consecutive hours took place at Newmarket, in June and July, 1809.
